

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

The NEW INTERNATIONAL YEAR BOOK differs in scope from other annual publications. It is intended to be an encyclopædia of the year. It therefore includes departments which are not to be found in any other single annual volume. It is enabled to do so first by its large size and second by its exclusion of information not pertaining to the year or not derived from the latest sources available. Among the departments that are either not to be found or are less fully treated in other annual publications, are Biography, Agriculture, Political History, Societies and Religious Bodies. American subjects are, of course, far more fully treated than in any of the British annuals. At the same time owing to its international scope it necessarily devotes more attention to foreign affairs than do the other American publications. The plan of the work requires that the text shall be new each year and no part of it carried forward and merely revised. There has been a slight deviation from this rule in the present volume in that the paragraphs on Manufactures in a few of the articles on the States in the 1911 volume have been in part repeated in order to admit of comparison with the statistics of manufactures for the other States which are now for the first time included in this volume. The PRESIDENTIAL CAMPAIGN, marking as it did a new turn in American political history, required unusually full treatment. Nearly fifty pages have been given to it and especial pains have been taken to insure comprehensiveness and impartiality. Among other subjects which have required special attention are the TITANIC DISASTER and the question of SAFETY AT SEA; the Balkan War, which is treated under the title TURKEY AND THE BALKAN PEOPLES; RAILWAY ACCIDENTS; ELECTORAL REFORM; MINIMUM WAGE; WORKINGMEN'S COMPENSATION; SYNDICALISM; SURGERY; SYNTHESIS OF RUBBER; PANAMA CANAL; AQUEDUCTS; CITY PLANNING.

LIST OF CONTRIBUTORS

AGRICULTURE, HORTICULTURE, CHEMISTRY, INDUSTRIAL, AND EXPOSITIONS
FOODS, IRRIGATION, BOTANY, FORESTRY, ETC.

ALFRED CHARLES TRUE, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND

MARCUS BENJAMIN, PH. D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

EDWIN WEST ALLEN, PH. D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
ASSISTED BY EXPERTS IN THE DEPARTMENT OF
AGRICULTURE AT WASHINGTON.

DRAMA

CLAYTON HAMILTON,
DRAMATIC CRITIC FOR THE "BOOKMAN."

ANTHROPOLOGY AND ETHNOLOGY

CLARK WISSLER, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY, AND
ROBERT H. LOWIE, PH. D.,
AMERICAN MUSEUM OF NATURAL HISTORY.

ECONOMIC AND POLITICAL SCIENCE

FRANK HAMILTON HANKINS, PH. D.,
ASSISTANT PROFESSOR OF ECONOMICS AND SOCIOLOGY, CLARK COLLEGE.

ARCHÆOLOGY

OLIVER SAMUEL TONKS, PH. D.,
PROFESSOR OF ART IN VASSAR COLLEGE.

EDUCATION

MILO B. HILLEGAS, PH. B.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCATION, TEACHERS COLLEGE, COLUMBIA UNIVERSITY.

ARCHITECTURE

A. D. F. HAMLIN, M. A.,
PROFESSOR OF THE HISTORY OF ARCHITECTURE,
AND EXECUTIVE HEAD, SCHOOL OF ARCHITECTURE, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING

WILLIAM E. WICKENDEN, B. S.,
ASSISTANT PROFESSOR OF ELECTRICAL ENGINEERING, MASSACHUSETTS INSTITUTE OF TECHNOLOGY.

ASTRONOMY

T. W. EDMONDSON, PH. D.,
PROFESSOR OF MATHEMATICS, NEW YORK UNIVERSITY.

EXPLORATION AND POLAR RESEARCH

CYRUS C. ADAMS,
MEMBER OF THE STAFF OF THE AMERICAN GEOGRAPHICAL SOCIETY, GEOGRAPHICAL WRITER FOR THE NEW YORK "SUN."

CHEMISTRY

JAMES LEWIS HOWE, PH. D.,
PROFESSOR OF CHEMISTRY AT WASHINGTON AND LEE UNIVERSITY.

FOREIGN GAZETTEER

EDWARD LATHROP ENGLE AND
ALLAN EVA ENGLE.

GEOLOGY

DAVID HALE NEWLAND,
ASSISTANT STATE GEOLOGIST, NEW YORK.

INTERNATIONAL ARBITRATION

CLINTON ROGERS WOODRUFF, LL. B.,
SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND OF THE MOHONK CONFERENCE,
AND PRESIDENT OF THE BOARD OF PERSONAL
REGISTRATION, PHILADELPHIA.

LIBRARY PROGRESS

M. R. HAINES,
MANAGING EDITOR OF THE "LIBRARY JOURNAL."

LITERATURE, ENGLISH AND AMERICAN

EDWIN E. SLOSSON, PH. D.,
LITERARY EDITOR, "THE INDEPENDENT."

LITERATURE, FRENCH

ALBERT SCHINZ, PH. D.,
PROFESSOR OF FRENCH LITERATURE, BRYN MAWR
COLLEGE.

LITERATURE, GERMAN

AMELIA VON ENDE,
CONTRIBUTOR TO NEW YORK EVENING "POST"
AND "NATION."

MANUFACTURES, CIVIL ENGINEERING, TECHNOLOGY, AERONAUTICS, AND FIRE PROTECTION

HERBERT TREADWELL WADE.

MEDICINE

ALBERT WARREN FERRIS, A. M., M. D.,
SENIOR RESIDENT PHYSICIAN, GLEN SPRINGS,
WATKINS, N. Y.; FORMER PRESIDENT, NEW YORK
STATE COMMISSION IN LUNACY; FORMER AS-
SISTANT IN NEUROLOGY, COLUMBIA UNIVER-
SITY; FORMER ASSISTANT IN MEDICINE, NEW
YORK UNIVERSITY AND BELLEVUE HOSPITAL
MEDICAL COLLEGE; ASSISTED BY

DAVID G. YATES, M. D.,
SURGEON, NEW YORK CHILDREN'S HOSPITAL;
SURGEON, DEMILT DISPENSARY.

MILITARY PROGRESS

C. DEW. WILLCOX,
LIEUTENANT-COLONEL, U. S. A., PROFESSOR OF
MODERN LANGUAGES, U. S. MILITARY ACADEMY.

MILITARY STATISTICS, FOREIGN

HERBERT TREADWELL WADE.

MUSIC

ALFRED REMY, M. A.,
PROFESSOR OF HARMONY AND COUNTERPOINT,
INTERNATIONAL CONSERVATORY, NEW YORK.

NAVAL PROGRESS AND BATTLESHIPS

H. F. BRYAN,
COMMANDER, U. S. N.

PAINTING AND SCULPTURE

FLORENCE N. LEVY,
EDITOR, "AMERICAN ART ANNUAL."

PHILOLOGY

CHARLES KNAPP, PH. D.,
PROFESSOR OF CLASSICAL PHILOLOGY, BARNARD
COLLEGE, COLUMBIA UNIVERSITY; AND

LOUIS H. GRAY, PH. D.,
ASSOCIATE EDITOR OF THE "ORIENTALISCHE
BIBLIOGRAPHIE."

PHILOSOPHY

FRANK THILLY, A. M., PH. D., LL. D.,
PROFESSOR OF PHILOSOPHY, SAGE SCHOOL OF
PHILOSOPHY, CORNELL UNIVERSITY.

PHYSICS

W. W. STIFLER, PH. D.,
LECTURER IN PHYSICS, COLUMBIA UNIVERSITY.

PSYCHOLOGY, PSYCHICAL RESEARCH, AND PSYCHOTHERAPY

MADISON BENTLEY, B. S., PH. D.,
HEAD OF THE DEPARTMENT OF PSYCHOLOGY,
UNIVERSITY OF ILLINOIS; AND

CHRISTIAN A. RUCKMICH,
INSTRUCTOR IN PSYCHOLOGY, CORNELL UNIVER-
SITY.

RAILWAYS

WILLIAM E. HOOPER,
ASSOCIATE EDITOR, "RAILWAY AGE GAZETTE."

SANITARY ENGINEERING AND MUNICIPAL ACTIVITIES

MOSES NELSON BAKER, C. E.,
EDITOR OF THE "ENGINEERING NEWS."

SPORTS

CHARLES A. TAYLOR,
MEMBER OF THE STAFF OF THE NEW YORK
"TRIBUNE"; AND

ARTHUR BARTLETT MAURICE,
EDITOR OF THE "BOOKMAN."
(Article Football)

UNIVERSITIES AND COLLEGES

MILO B. HILLEGAS, PH. D.,
ASSISTANT PROFESSOR OF ELEMENTARY EDUCA-
TION, TEACHERS COLLEGE, COLUMBIA UNIVER-
SITY.

WEIGHTS AND MEASURES

(Metric System; Recent Progress)

CH.-ED. GUILLAUME,
ADJUNCT DIRECTOR OF THE INTERNATIONAL
BUREAU OF WEIGHTS AND MEASURES.

ZOOLOGY AND BIOLOGY

AARON L. TREADWELL, PH. D.,
PROFESSOR OF BIOLOGY, VASSAR COLLEGE.

NOTE: Cross references in SMALL CAPITALS indicate that the allusion is to a separate article; cross references in *italics* denote that the reference is to a subdivision of a main article. A cross reference in *italics*, standing alone in an article, carries the reference to another subdivision of the same article. The letters q. v. (*quod vide*=Latin "which see") in parentheses following a word, indicate that the subject is treated under its own name elsewhere in the volume.

NOTE: In certain tables in this work it will be found, by addition, that the totals do not correspond to the sum of the items. This is the result of the omission or inclusion of certain small items which are not mentioned in the table, but are included in the totals. This is a usage frequently employed in the compilation of government statistics, from which sources the greater number of the tables in the YEAR BOOK are taken.

THE NEW INTERNATIONAL YEAR BOOK

ABYSSINIA. An independent empire of eastern Africa. Area variously estimated at from 308,000 to 432,000 square miles. The population consists of Semitic Abyssinians, Gallas and Somalis, Negroes, Falashas, and non-natives—in all between nine and eleven millions. Addis Abbeba, the capital, has from 30,000 to 35,000 inhabitants; Harar, 50,000; Aksum, 5000. The Alexandrian is the national church, and education is in the hands of Coptic teachers. Cattle- and sheep-raising and a primitive sort of agriculture are the main industries. The forests yield rubber and valuable timbers. Gold-mining tracts extend along the banks of the Baro River, and coal has been found. Imports through Jibuti in 1909, about £811,566; in 1910, £950,147. Exports by way of Jibuti average £335,000. Imports through Zeila, the Sudan, and Italian colonies, about £192,795 in 1909; exports average about £40,000. American cotton goods and arms and ammunition, provisions, wearing apparel, and hardware are the chief imports; coffee, hides and skins, wax, ivory, rubber, civet, gum-arabic, and glue the main exports. Miles of railway in Abyssinia, 111; of telegraph, 1056. Progress was being made during the year on the extension of the Addis Abbeba-Dire Dawa extension of the Djibuti line to Dire Dawa.

Menelek II. (born 1844) has been emperor since 1889; but owing to his incapacity the government has been administered since 1910 by his grandson, Lidj Jeassu (born 1897).

ACADEMY, French (Académie Française). The French Academy is the first of the five academies constituting the Institute of France. It consists of forty members and is the final authority on questions relating to the niceties of the French language and of grammar, rhetoric, and poetry, and of the classification of French classics. Two new members were elected in 1912: Gen. Louis Lyautey to succeed Jules Henri Poincaré and Emile Boutroux to succeed Hippolyte Langlois de Vogüé. There was one vacancy in the academy at the end of the year.

ACCIDENTS. See EMPLOYERS' LIABILITY, INSURANCE, RAILWAY ACCIDENTS, ETC.

ACCIDENTS AND DISEASES. See LABOR LEGISLATION.

ACCIDENTS, COAL MINE. See COAL.

ACCIDENTS, COMPENSATION FOR. See LABOR LEGISLATION.

ACCIDENTS, PHYSICIAN'S DUTY TO REPORT. See LABOR LEGISLATION.

ADAM, JOHN NOBLE. An American merchant and public official, died February 9, 1912-1

1912. He was born in Peebles, Scotland, in 1842, and was educated in a parochial school in Edinburgh. He was apprenticed to business in Edinburgh from 1854 to 1864. He was engaged in business in that city from 1865 to 1872. In the latter year he came to the United States and engaged in business in New Haven, Conn., where he remained until 1881, when he removed to Buffalo. He was very successful and in 1903 was enabled to retire with a large fortune. He then began to devote himself to politics. He was a candidate for mayor in 1905 and was elected by the largest majority ever given to a mayor in Buffalo. His administration attracted attention throughout the country. It was conducted on a sound basis and was considered a model of municipal government. He was several times mentioned as possible candidate for governor of the State on the Democratic ticket.

ADEN. A British dependency in southwestern Arabia; a part of the Bombay Presidency. Its area is 75 square miles and that of the attached island of Perim 5 square miles; population (1911), 46,165. The area of the protectorate extends over some 9000 square miles (estimated population, 100,000). The town of Aden is an important coaling and trading station, strongly fortified. Exports consist of coffee, gums, skins, and hides, cotton goods, feathers, spices, etc.; and were valued in 1909-10 at £2,621,780 by sea and £102,594 by land; treasure, £545,341. Imports (1909-10), £2,956,055 by sea, £163,693 by land; treasure, £524,706. The settlement is presided over by a resident (1912, Brig-Gen. J. A. Bell) subject to the Bombay government.

Besides Perim, the island of Sokotra (1382 square miles, 12,000 inhabitants) and the Kuria Muria Islands (five in number) are attached to Aden.

ADMINISTRATION. See UNITED STATES.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE. The sixty-fourth meeting of this association convened in Cleveland, O., December 30, under the presidency of Dr. Charles Edward Pickering. A number of other societies, most of them affiliated with the association, met at the same time. These included, among others, the American Mathematical Society, the Entomological Society of America, the American Microscopical Society, the American Psychological Association, the American Association of Anatomists, the American Physiological Society and the American Society of Naturalists. Addresses of welcome were delivered by Mayor Baker of Cleveland, Dr. Charles F. Thwing, president of the

Western Reserve University, and Dr. F. M. Comstock, acting-president of the Case School of Applied Science. Responses were made by President Pickering. The annual address was delivered by the retiring president, Dr. Charles Edward Beesey. The address was entitled: "Some of the Next Steps in Botanical Science." The annual addresses of the retiring vice-presidents were as follows: Geological and Geographical Section, "Significance of the Pleistocene Mollusks," Vice-President Shimek; Section of Mathematics and Astronomy, "The Spectroscopic Determination of Stellar Philosophies, Considered Practically," Vice-President Frost; Section of Zoölogy, Section F, "Is it Worth While?" Vice-President Nachtriebe; Section of Botany, "The Scope of State Natural History Surveys," Vice-President Newcomb; Section of Physics, "Unitary Theories in Physics," Vice-President Millikan; Section of Physiology and Experimental Medicine, "On the Function of Individual Cells in Nerve Centres," Vice-President Porter; Section of Education, "Educational Diagnosis," Vice-President Thorndike; Section of Anthropology and Psychology, "The Study of Man," Vice-President Ladd; Section of Social and Economic Science, "Comparative Measurements of the Changing Cost of Living," Vice-President Norton. Other noteworthy addresses delivered at the meeting include the following: "Across the United States with the European Geographers," by Dr. W. Humphreys of the United States Weather Bureau; "A Summary of the Study of Agricultural Instruction in Rural Schools," President Benjamin M. Davis of the American Nature Study Society; "The Relation of Climate to Horticulture," President W. T. Macoun of the Society for Horticultural Science. A number of symposiums and sessions were held by the various sections and affiliated societies. The following officers were elected for 1913: president, E. B. Wilson, Columbia University; vice-presidents, Section A, Frank Schlesinger, Allegheny Observatory; Section B, A. D. Cole, Ohio State University; Section C, A. A. Noyes, Massachusetts Institute of Technology; Section D, O. P. Hood, United States Bureau of Mines; Section E, J. S. Diller, United States Geological Survey; Section F, A. G. Mayer, Carnegie Institution of Washington; Section G, H. C. Cowles, University of Chicago; Section H, W. B. Pillsbury, University of Michigan; Section L, P. P. Claxton, United States Commissioner of Education; general secretary, H. W. Springsteen, Western Reserve University. The next meeting will be held at Atlanta, Ga., in December, 1913, and January, 1914.

ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR. See BIOLOGY.

ADVENTISTS, SEVENTH-DAY. The chief tenets of this body are a belief in the literal, personal second appearing of Christ, yet without ever setting a time for that event, and the observance of the seventh day of the week as the Sabbath. Their total communicants throughout the world are 108,975. They have 116 organized conferences, 93 mission fields, 2799 churches, 89 advanced educational institutions, 613 primary schools, total enrollment, 23,541; 37 publishing houses and branches, 102 sanitariums and branches, publish 125 periodicals, issue publications in 71 languages, are operating in about 85 countries, and employ over 10,000 evangelistic and institutional laborers,

thus constituting every eleventh member an active laborer. Total contributions for 1911 were \$2,363,088.29, a per capita of \$21.68. Total funds for evangelistic work since the organization of the central governing body known as the General Conference, in 1863, aggregate over twenty-three million dollars. Total investments, in institutions, churches, etc., exceed thirteen million dollars.

In the year 1894 active work was begun in non-Christian lands, and has been continued until the present, so that a segregation of the work conducted in non-Christian and non-Protestant lands from the foregoing figures, indicates the following: Mission work is carried forward in 67 countries, at 140 main stations, and 145 sub-stations, with a total foreign force of 586, and 974 native helpers, a total force of 1560 laborers. There are 413 churches, 17,565 adherents, 7454 pupils in 205 schools, taught by 364 foreign and native teachers. Publications are issued in 64 languages, and work is conducted orally in 73 languages. Total income for 1911 from the foreign field was \$135,234.87, a per capita of \$7.69.

The headquarters of the denomination is in Washington, D. C., in which place will be held in May, 1913, the next quadrennial session, which will commemorate fifty years of organized work by the denomination. At this gathering delegates and representatives will assemble from all over the world.

ADULTERATION. See FOOD AND NUTRITION.

AEHRENTHAL, ALOIS LEXA VON, Count. Premier and foreign minister to the Austro-Hungarian Empire, died February 17, 1912. He was born in 1854 and was educated at the Universities of Bonn and Prague. In 1877 he entered the diplomatic service and after occupying various subordinate positions in Paris and St. Petersburg and in the foreign ministry at Vienna he was made minister to Rumania in 1888. In 1889 he was transferred as ambassador to St. Petersburg and in 1906 he became premier and foreign minister. The most notable event of his career in public life was the annexation of Bosnia and Herzegovina in October, 1908. This was carried out largely through his efforts and with such force and diplomacy that it won for him the title of the "Bismarck of Austria." The two provinces had been under a protectorate of Austria since the Treaty of Berlin in 1878, and, although the taxes had been collected by Austrian officials, Turkey had enjoyed a nominal suzerainty. The success of Japan in the Russo-Japanese War, which destroyed to a large extent the power of Russia as a military force in Europe, opened the way for a bold stroke on the part of Austria, which had hitherto been deterred from actual seizure of these provinces through fear of Russia. It was said that von Aehrenthal, by secret negotiations, made sure of the support of the German Emperor and arranged with Prince Ferdinand of Bulgaria to share the burden of the seizure by acting simultaneously with him in proclaiming his kingship and the independence of his state. Although the seizure of the provinces filled Europe with amazement, no power dared or cared to move first and the event was accomplished without serious trouble. At the time of the seizure of the provinces von Aehrenthal was regarded as a close ally of the heir to the throne, the Archduke Francis

Ferdinand, who had been a strong advocate of the seizure of the Turkish provinces. In 1910, however, von Aehrenthal placed himself at the head of the peace party in Austria-Hungary, insisting in particular upon a pacifying attitude towards Italy. The archduke, who was regarded as the head of the war party, became bitterly offended, and just after the outbreak of the war between Italy and Turkey a ministerial crisis arose over the attitude which Austria should hold toward Italy. The quarrel was laid before the Emperor Francis Joseph for decision and von Aehrenthal placed his resignation in the emperor's hands. The emperor gave unqualified support to the peace policy and it marked a triumph for von Aehrenthal. It was, however, his last triumph. He was already in broken health and the strain of the struggle with the archduke completed the wreck. Within a few days he was obliged to take to his bed and never left it until the time of his death.

AERONAUTICS. The navigation of the air by aeroplane, dirigible balloon, and aerostat or spherical non-dirigible balloon is as usual discussed under the broad title of aeronautics in the YEAR BOOK. In the record for 1912 much important progress was to be noted, yet many of the sensational features of previous years were absent. Steady advances were manifested, especially in aviation and the development of the hydro-aeroplane, while a new record for spherical balloons was made in the international race held in Germany.

AVIATION

In the period from 1908 when Europe was thrilled by the wonderful achievements of Wilbur Wright, whose untimely death was a sad event of the year under discussion, and by the Rheims Aviation Meet of 1909, the development of the aeroplane had proceeded steadily, and by 1912 aviation had passed beyond the point where a few daring enthusiasts were willing to risk their lives on machines designed without a thorough knowledge of the various elements involved and frequently imperfectly constructed. Furthermore, spectacular exhibitions too often accompanied by feats of useless and reckless daring, had been supplanted by more serious long distance competitions, and the military applications of the aeroplane were being not only considered, but under practical test by the armies and navies of the great powers in some cases in actual war. In fact it was to the military and naval services that inventors and manufacturers largely looked for the sale of their machines, as aside from such support there was little other practical application that assured immediate commercial returns. Accordingly the most striking features connected with aviation during the year 1912 have been in the development and use of aeroplanes by the various military services, and to this must be added the growth of interest in the hydro-aeroplane and its consequent improvement.

The military aeroplane is now recognized as an essential implement of war and not only did it find practical application in actual warfare by the fighting armies in 1912, but the equipment and training of aerial battalions was proceeding apace. So far as design and construction were concerned this fact tended towards conservatism and a progressive develop-

ment, as the requirements for military service were not essentially different from what would be demanded under other conditions. For example, the transport of passengers, either for observation or to drop explosives, was considered an essential of the military aeroplane, and this, of course, is one of the main functions of any machine for mechanical flight. Furthermore, it must carry some armament, as bombs for dropping or guns for attacking dirigibles and weight-carrying possibilities go also with the future commercial vehicle. The military developments in their special relations to the armies and navies of the world will be found discussed at length under **MILITARY PROGRESS** and **NAVAL PROGRESS**.

The year's development in the case of the hydro-aeroplane was of special significance and interest, for its use promised to become more general and there seemed to be a strong probability that its employment for sport might find a field comparable to that of yachting or at least ice boating. The hydro-aeroplanes as built in 1912 afforded good sport without undue danger and did not require any elaborate aerodrome or chosen field for rising or landing. In fact at the Paris Aero-exposition nearly all of the aeroplanes exhibited were arranged so that floats could be adapted for use over water, while in America it was reported that the most active demand was for such types of aeroplanes.

PROBLEMS OF DESIGN AND CONSTRUCTION. Perhaps the most important technical problem in connection with aeroplane design during the year was the attempt to obtain automatic inherent stability independent of the action of the aviator. This problem was not solved, but the operation of an aeroplane remained in the same condition as that of the bicycle where the rider instinctively preserves his balance by changing the direction of the wheel. Similar methods of regulation were required for the aeroplane. Some form of gyroscope was advocated to accomplish this regulation mechanically, and in fact the gyroscopic action of the rotary motor was considered available for this purpose. Other experiments such as the oil pump and inertia weights, devices of Esnault, Pelterie, and others, were also undertaken, and even a pendulum or the pendular mounting of the motor on a swinging cross-frame were proposed.

In the strength of the aeroplane and its materials, important developments were being made. Here progress was satisfactory, as wood was being eliminated and the higher grades of steel were extensively employed. At the Paris Aviation Exposition in October, of 45 representative machines exhibited, 10 had the frame work entirely of steel, 21 of wood and steel, and 14 of wood, while in 1911 wooden construction was observed in the majority of machines. This improvement in construction was shown in the Hanriot monoplane, where the entire skeleton was composed of steel tubing which was solidly welded together in one piece by the oxy-acetylene process. The use of steel and aluminum for propellers had not proved so successful, as it was found difficult to join the blades to the boss so firmly as to resist the centrifugal stress developed by the rapidly rotating propeller, but towards the end of the year it was proposed to press the blades and boss from a single piece of steel tubing, and this plan was said to have many favorable fea-

tures. The strengthening of the aeroplane fabrics was also being accomplished by various forms of treatment which not only tightened and strengthened the material, but made it water proof.

MOTORS. Just as the evolution of the aeroplane depended upon success of the light-weight internal combustion motor, so its future development was considered to be bound up in the improvement and increased efficiency of the gasoline engine. The rotary motor was extensively used in 1912, but further improvements and greater efficiency were being demanded. It was noisy in operation and wasteful of lubricating oil. In the British army aeroplane competitions it was ascertained that the average consumption of gasoline by machines fitted with rotary motors was .085 gallons per horsepower hour, and that the average consumption of lubricating oil for the same machines was .02 gallons per horsepower hour. Two of the non-rotary machines used in this same test used .075 and .068 gallons per horsepower hour respectively and their oil consumption was .0034 and .0143 gallons. Considerable discussion was had of the gyroscopic forces developed by the rotary motor when sharp turns were executed, and it was proposed that two contrary running motors be used, either working on the same axis or in the same plane. Experiments along these lines have been made with the Gnome engine which seem to indicate that the gyroscopic torque was considerably less than other forces due to the action of gusts of wind. The Gnome motor was used by Védérines in his successful monoplane flight at Chicago and was employed for monoplanes shown at the British army aeroplane trials. The Renault and Daimler were also favorite motors during the year in Europe, and the former especially, which works almost noiselessly, had many important advantages. During the year some progress was made with a two-motored aeroplane and it was reported that Grahame-White expected to fly to America, using a machine fitted with four motors of 250 horsepower each. The transatlantic trip was quite actively discussed during the year, and Grahame-White believed that it could be accomplished in 30 hours.

DISTANCE AND DURATION RECORDS of importance were made by Alexander Fournery, chief instructor of the Maurice Farman school of Aviation at Buc. On September 11, starting at 5.53 A. M., he circled continuously the aerodrome at Étampes for 13 hours and 22 minutes, covering a total distance of 1017 kilometers (631.93 miles), at an average speed of 47.27 miles an hour. At the beginning of his trip he carried in his tanks 71 gallons of gasoline and his descent was effected in the darkness, in fact the last hour of his flight was made by using bonfires kindled on the ground below as guides. Aside from the records here achieved this trip was of interest as indicating how a more powerful machine could make a long distance trip as from New York to Chicago in less than half the time of a modern express train without remaining in the air a prohibitive length of time. Such an achievement of course involves also the transportation of a heavy load of fuel and the successful and continuous operation of the motor.

ALTITUDE RECORDS. By the use of oxygen to support respiration at high altitudes it was

found possible during 1912 to add materially to the records for height. On September 6, Roland Garros in a Blériot monoplane ascended to a height of 18,240 feet, but this record remained only a few days, for on September 17, Georges Legagneux, ascending from the aerodrome at Villacoublay in a Morane-Saulnier monoplane, attained a height of 18,761.60 feet, or more than three and one-half miles above the earth. The use of oxygen was required at an altitude of 15,748 feet and it was suggested that as the motors work with difficulty and are apt to stop above a height of 10,000 feet there should be provided some means of supplying oxygen to the engines. Aside from the record and the use of oxygen this trip was memorable for the quick climbing of the monoplane. The first 1000 meters were attained in 2½ minutes, the next two stages of 1000 meters involved five minutes each, 7½ minutes were required to reach 4000 meters, and 15 minutes to attain 5000 meters. The full height, 5720 meters (18,761.60 feet), was gained in 45 minutes, while the return to earth was made in less than 10 minutes. This record was broken by Garros on December 11, at Tunis, where he rose to a height of 5801 meters (19,032 feet), or approximately 3.6 miles in a flight that lasted 1 hour and 11 minutes.

SPEED RECORDS were also improved during the year and the wonderful work of J. Védérines in his Deperdussin monoplane at Betheny, France, and at Chicago, Ill. (see below), established a new series of records up to 250 kilometers (155.342 miles). M. Tabuteau at Pau, France, on March 1, 1912, in a Morane-Saulnier monoplane with a 50 horsepower Gnome motor, made a record of 2 hours, 7 minutes, 54 1-5 seconds, for 250 kilometers, while for 300 kilometers (186.411 miles) E. Cobiono, at Somma, Italy, on March 28 of the same year, in a Caproni monoplane with a 50 horsepower Anzani motor, made the distance in 2 hours and 49 minutes. M. Tabuteau, on February 23, extended the two hours' record to 227.454 kilometers (141.33 miles) and on January 24, the three hours' record to 310.287 kilometers (192.803 miles).

The records for an aviator and one passenger for the various distances from 10 to 150 kilometers were broken on July 20, 1912, by G. Legagneux at Corbeaulieu, France, with a Zens monoplane having an 80 horsepower motor; his record for 10 kilometers being 4 minutes, 24 4-5 seconds, and for 150 kilometers 1 hour, 7 minutes and 10 seconds, the intermediate distances being almost in proportion. At the same time the records for thirty minutes, and one hour's flight for aviator and one passenger were also broken, 66.639 and 133.469 kilometers being scored respectively. An important distance record of 401.495 kilometers (249.477 miles) for an aviator and one passenger was achieved by Lieutenant H. B. Barrington-Kennett at Salisbury Plain, England, on February 14, in a Nieuport monoplane with a 70 horsepower motor, while the records for three, four, and five passengers were also broken during the year, a Somner biplane piloted by H. Moller being maintained in the air at Douzy, France, for 1 hour, 5 minutes, 48 1-5 seconds.

On June 29, 1912, Lieutenant Blaschke, at Vienna, with one passenger was able to go aloft to a height of 4360 meters (14,300 feet) in a Lohner-Arrow biplane with a 120 horsepower

Austrian-Daimler motor. A few days before, on June 23, 1912, he had carried two passengers to a height of 3580 meters (11,756 feet).

The greatest distance in a single day was that made by Pierre Daucourt from Valenciennes to Biarritz, France, on October 1, 1912, traveling in a Borel monoplane with a 50 horsepower Gnôme motor. This was 570 miles and was a noteworthy cross-country flight.

Records were being made with hydro-aeroplanes, and Lieutenant John H. Towers, U. S. N., on October 6, at Annapolis, Md., in a Curtiss biplane with a 75 horsepower Curtiss motor made a notable continuous flight of 6 hours and 10 minutes. A notable trip was made during the year in a hydro-aeroplane by Anthony Jannus, who traveled 1970 miles from Omaha to New Orleans in a Benoist hydro-aeroplane with a 75 horsepower Roberts motor. His time from Kansas City to St. Louis (471 miles), flying alone, was 9 hours, 23 minutes, or 25 per cent. faster than that of the express trains. For the remainder of the distance he carried a passenger and an 85-pound case of beer. This trip, concluded on December 16, was the greatest total distance ever made by an aeroplane with a passenger and was the greatest total distance made in a hydro-aeroplane, either with or without a passenger. While he made many stops along the route, yet he demonstrated the feasibility of using the hydro-aeroplane for long distance work, and the damage to his engine and the hydro-aeroplane was insignificant.

BRITISH ARMY TRIALS OF 1912. Just as the French military trials of 1911 brought together the leading types of aeroplanes in active competition for substantial prizes, so in 1912, the British army held a competition at Salisbury Plain in August. For these trials 32 machines were entered and 25 were actually at the field, but of these 3 did not compete. The Mersey monoplane, where the propeller was situated at the back of the main frame, was wrecked, and Robert C. Fenwick, its pilot, killed. Of the 14 British and 7 French machines left in the competition, 11 passed through the trials satisfactorily despite the bad weather and heavy winds. The conditions of the competition required carrying two persons, weighing 350 pounds, and fuel oil sufficient for a flight of 4½ hours, making an aggregate load of about 800 pounds. A height of 450 feet was to be reached and a height of 1500 feet was to be maintained for three hours, but the machine was to climb at the rate of at least 200 feet per minute and to glide with the engine cut off on a gradient of 1 in 6. The machines must be capable of rising and landing in a plowed field, of flying at a speed of 55 miles an hour, of being steered while running slowly on the ground and of flying in high winds. The prize of £4000 in the international division was awarded to the Cody biplane, which was fitted with an Austrian-Daimler motor, and this machine also received a first prize of £1000 in the British division, being the only British machine that completed all the tests. The second prize of £1000 in the international division was awarded to the Deperdussin monoplane. No second prizes in the British division were awarded, and three third prizes of £500 were given to the British Deperdussin monoplane and to two Bristol monoplanes, all being equipped with Gnôme motors.

Six machines appearing in the competition were awarded prizes of £1000 each, these being two Hanriot monoplanes, two Blériot monoplanes, one Maurice biplane and one Avro biplane. The judges in this competition called attention to the fact that in all cases the successful motors were of continental design and construction, but that those of British type, while not proving themselves as capable, indicated promise. In the opinion of the judges the aeroplanes entered were not strictly military and would require certain modifications for use in fighting and scouting. The competitions served to arouse considerable interest in military aeronautics, which were being taken up in earnest by the British army.

GORDON BENNETT AVIATION TROPHY. This annual speed contest was held at Chicago in 1912, as the cup had been won in the previous year by C. Weymann in a Nieuport monoplane. This year there was no American monoplane in the competition, which so far as international rivalry was concerned was distinctly one-sided, as the three competing monoplanes were all French. The contest was held in September and the distance to be covered was 124.8 miles, or 30 circuits each of 4.16 miles of an elongated rectangular course terminated by hexagonal ends. The competing machines were a Deperdussin monoplane of 140 horsepower, known as a "monocoque," piloted by Jules Védrines; a 100 horsepower machine of the same make with Maurice Prévost as pilot, and a Hanriot 100 horsepower monoplane with André Frey as pilot. The contest was won by Védrines in 1 hour, 10 minutes and 57 seconds, his official average being 105.5 miles an hour for the entire distance as compared with 100.05 for Prévost, and 98 miles an hour for Frey over 23 laps, the latter being compelled to cease flight in his twenty-fourth round on account of motor troubles. At the close of the race Védrines flew 12.48 miles or three times around the course in 6 minutes and 55.95 seconds, making new world records for 5, 10, and 20 kilometers, the kilometers being covered at the rate of 107.68 miles per hour. The contest was marked by excellent weather conditions and skillful control on the part of the aviators. The absence of American participants was felt to be considerable of a reproach, but there were not available any fast monoplanes that could compete with speedy and well-built French machines.

The race for the **GRAND PRIX DE L'AERO CLUB** of France was held June 16-17 on a triangular course of about 98½ miles between Angers-Chozet-Saumur. The conditions of the flight required a seven-lap race around a circuit aggregating 683 miles. The prizes amounted to about \$10,000. Unfavorable weather conditions required a flight of three laps on the first day and four laps on the second. The first trials resulted in the elimination of all but two competitors and of these one was unable to finish his third lap within the appointed time owing to the extremely unfavorable weather conditions. Garros, the successful competitor, in a Blériot monoplane, on the second day showed great skill and pluck, completing the fourth lap in an outburst of great enthusiasm, with a total record of 16 hours, 16 minutes and 8 seconds.

Garros, whose records for height are mentioned above, in December made a remarkable

flight from Tunis to Sicily, 180 miles over sea and thence to Italy and Rome, with torpedo boats to guide him on his way. The total distance accomplished was 700 miles and the flight was the most notable over-sea trip since that in which Lieutenant Bague perished.

COMPETITION OF AVIETTES. If any demonstration were needed of the fact that aviation is absolutely dependent upon the powerful and light-weight internal combustion motor, it was supplied at a competition of "Aviettes," or machines designed for artificial flight solely by the aid of muscular power. A prize of 10,000 francs was offered for a machine that, propelled by human power alone, could fly 32.8 feet twice in opposite directions and a prize of 1000 francs for one that flew 3.28 feet at a height of about 4 inches. The competition was held at Paris on July 2, and attracted 23 entrants, but none was able to show a machine capable of sufficient speed to leave the ground, and all were radically defective in principles of design. The prizes, offered by a firm of bicycle manufacturers and open for competition until the spring of 1913, were not awarded at the end of 1912. On October 19, Rettich, the cyclist, in an aviette jumped over sticks 10 centimeters high placed 1 meter apart; while later in the year this performance was somewhat bettered.

DIRIGIBLE BALLOONS

The progress in the construction of dirigibles during 1912 showed about the same relative advance as in previous years. France and Germany continued to develop their airship fleet and in Germany the dirigibles were operated with more or less success; in fact the successes with dirigibles were almost as conspicuous as the failures, for the misfortunes of previous years continued, as will be noted below. As a fair-weather machine available for many purposes, the dirigible certainly has its place, but exposed to sudden changes of wind and temperature the feeling was general that its use was attended with considerable hazard. Preëminence in this field of aeronautics still remained with Germany, and the sole large airship built in the United States met with misfortune on its initial trip.

THE VANIMAN AIRSHIP "AKRON." The large dirigible balloon *Akron*, which had been designed and built during the year 1911 for a transatlantic voyage, was destroyed early on the morning of July 2, at Atlantic City, by an explosion in which this distinguished aeronautical engineer and his crew of four men lost their lives. The *Akron* was the first and only airship to be built in the United States that fairly might be compared with European dirigible balloons, and the chief features in its construction were the use of a fabric far stronger than any hitherto employed and the provision of means to admit or relieve the air in the ballonets and thus regulate the movement of the balloon up and down without releasing gas. Furthermore, by the use of water ballast drawn from the sea as required Vaniman believed that an additional means of control would be provided for the navigator. The *Akron* differed from European airships with their more powerful engines designed to maintain a high rate of speed in voyages over land.

The American inventor had to consider economy of fuel for the trip from the United States to Europe, and consequently his airship was designed to drift with favorable winds rather than to develop power. There were not the large aeroplanes and steadying fins found on many European dirigibles, the former being able to give a reaction either up or down of about 1000 pounds, while there was only one pair of orientable propellers driven from the central power plant.

About 6:15 on the morning of the accident the *Akron* was brought out of its hangar and in the presence of several thousand people proceeded to a point over Brigantine Beach. It was manœuvred with apparent facility, having completed two large circles and being in the course of a third when the explosion occurred. The airship was rising constantly and had reached an elevation of about 2500 feet when at 6:38 the observers saw the large gas bag suddenly rent near the stem and the disrupted envelope torn loose from the car. Frame and fabric fell into the sea and the inventor and his brave crew perished. Various theories were advanced to account for the explosion as there was but little positive evidence of its nature or cause. There was nothing to show that it was due to fire or a violent explosion of the gas. The rupture of the envelope may have been caused by the internal pressure reaching an excessive amount as the sun was getting hot and the balloon was rising rapidly at the time of the accident. It was also suggested that the breakage of the suspension ropes may have thrown all of the strain on the bottom fabric, ripping it open and loosening the bag from the car. Breakage of a propeller was also assigned as an explanation of the disaster. As Vaniman's attempted voyage with the ill-fated *America* in 1910 with this latter expedition represented about all to the credit of America in the field of the dirigible it will appear how serious a calamity to aeronautics in the United States was his untimely death.

THE "SUCHARD." The German dirigible *Suchard*, the construction of which had been undertaken in 1911, was completed in 1912 and on June 1 made its trial trip, remaining in the air ten minutes. It was found necessary, however, to postpone until the spring of the following year the transatlantic trip for which this large airship had been designed.

THE "SCHWABEN." After making 364 successful trips aggregating some 28,000 miles, in the course of which 6045 persons had been transported, the Zeppelin airship *Schwaben*, built in 1911, was destroyed on June 28, 1912, at Düsseldorf, Germany. This dirigible, which had proved so successful commercially, running on a regular schedule, at the time of its destruction was attempting to weather a storm at moorings, as it was deemed unwise to try to enter the balloon shed. The airship was caught by a sudden gust of wind which raised it into the air, breaking its back. The escaping gas was ignited, presumably by an electric spark generated by friction and the flames rapidly enveloped the entire structure as the huge dirigible swung at anchor. The fall to the ground broke the steel frame and completed the destruction, which was in part covered by insurance of \$162,000.

A sister ship of the *Schwaben*, the *Viktoria*

Luise, was completed in 1912, but was designed to be slightly faster, developing a speed of 45 miles per hour. Trials were held at Friedrichshafen in February, and on March 4 the airship went to Frankfurt to go into regular service, which continued through the season, 15,957 miles being covered in 183 trips and 3902 passengers carried. The gas bag, divided into 18 gas-tight compartments, had a capacity of 681,600 cubic feet. It had a length of 485.6 feet and a breadth of 45.9 feet, its three engines developing 450-460 horsepower. Further improvements were being made in the Zeppelin airships and the *Hansa* completed later in the year underwent satisfactory trials, while the German naval Zeppelin with engines of 600 horsepower was expected to develop a speed of 60 miles an hour.

During the year the Parseval firm which had achieved such notable success with airships of the semi-rigid type as used by the German army on account of their extreme portability as well as their general efficiency, decided to manufacture dirigibles with a rigid frame. This frame, however, was not to be of aluminum, as in the case of the Zeppelin airships, but of wood as used in those of the Schütte-Lanz type. The latter achieved considerable success during the year.

The success of the Aero-Dynamical Laboratories in Europe led Captain W. I. Chambers, chief officer of the United States Navy Aviation Corps, to recommend such a national institution for the United States. Acting on this recommendation President Taft appointed a commission of 19 members, including notable scientists, aeronauts, and army and navy officials, to investigate the possibilities of such an institution.

An innovation of the testing of aeroplanes for strength of wings and frames that received practical application in France was to mount a machine on a railway car drawn by a locomotive capable of developing a speed of 60 miles an hour. This plan was so successful that a special straightaway track of six miles with electric locomotive was projected to make further tests.

The first American international aeronautical exposition was held in New York May 9-18 in the Grand Central Palace. On the opening day R. J. Collier, president of the Aero Club of America, flew from Keyport, N. J., to the U. S. S. *Washington*, moored in the Hudson River, to deliver an invitation to Rear-Admiral Osterhaus to attend the exposition. The exposition was well attended and many novelties were shown.

The fourth aeronautic show to be held in Paris was opened on the 28th of October by President Fallières, assisted by the ministers of war and of the marine. Forty-six monoplanes and twenty biplanes, all of the latest types, were on exhibition, while but two balloons and no airships were to be seen. The show was devoted almost entirely to military aeroplanes, of which twenty-seven were exhibited by the French government, and hydro-aeroplanes for the use of the navy. The exhibition of aeronautic motors was a large one, the most noteworthy of these being the 400 horsepower motor designed for the Astra-Torres dirigible for Great Britain, the construction of which was being undertaken in France. The war department, besides showing aeroplanes and their component parts, had on exhibition the automo-

biles used for transporting such machines and repairing them.

HYDRO-AEROPLANES

The development of the hydro-aeroplane during 1912 was particularly rapid. It was only in the previous year that successful machines of this type had been produced. Fabre in 1910 had arisen from the water in a special type of aeroplane; in March, 1912, a hydro-aeroplane competition was held at Monaco, and by the middle of the year all interested in mechanical flights, and especially naval officers in all countries, were paying considerable attention to the marine side of the matter. The development was strikingly illustrated by the announcement of conditions for the 1913 competition at Monaco. The competing machines were all required to remain afloat for the two weeks' duration of the meet, and must show themselves capable of traveling four miles on the surface of the water and of being hoisted out of the sea by means of a crane and tackle. The final speed tests in the air were to extend over 50 miles and 300 miles. The object was to develop a sea-worthy as well as an air-worthy craft and the design and construction of the float or boats were receiving considerable attention.

In place of the extemporized floats fitted to many of the aeroplanes, specially designed arrangements were being used and machines were constructed with a water-tight body or hull, with a rudder for use in the water. Donnet-Léveque fitted a special hull to the biplane in which André Beaumont made an over-water flight from Paris to Bologne. In the United States, Grover Cleveland Loening exhibited a flying boat where a monoplane was fitted with a water-tight body forming a hull. In addition to the Monaco meeting in March, a successful competition was held at St. Malo, which included a flight from that town to the Island of Jersey and back, and a successful meeting was held in September at Heilighendam.

The first hydro-aeroplane competition held at Monaco from March 24 to 31, was participated in by seven biplanes, all of which were French with the exception of two Curtiss hydro-aeroplanes of regular type, which had been sent to France for this special purpose. The French machines on the other hand were standard aeroplanes that had been fitted with floats for the competition. The rules provided that getting off the water with the greatest number of passengers would secure an extra number of points, 30, 50, 75, and 100 per cent. being given to each aviator for accomplishing this with 1, 2, 3, or 4 passengers. Six tests were made, which included starting from and landing upon smooth water, 1 point each; starting from rough water, 2 points, and landing upon rough water 3 points, and running up on the beach and starting from it without getting the feet of the aviator or any of his assistants wet, 4 points each. First prize was \$1600 and second and third \$800 and \$600 respectively. The Curtiss machines were not adapted to passenger carrying, and for that reason did not fare as well in the contest as the large Farman biplanes, which were placed first and second. The results of the meet are summarized below: (1) Fischer (H. Farman biplane, Gnome motor), 112.1 points. (2) Renaux (M. Farman biplane, Renault motor), 103.9 points.

(3) Paulhan (Curtiss biplane, Curtiss motor), 86.3 points. (4) Robinson (Curtiss biplane, Curtiss motor), 71.9 points. Colliex, who had developed the Voison *Canard* during the previous year, made a number of good flights, but met with an accident with both of two machines. There was also shown at Monaco one monoplane of Deperdussin, piloted by Lorenzo, which made a successful flight with a passenger, but did not participate in the competition. The flights of the hydro-aeroplanes were observed by naval representatives of a number of governments.

AEROSTATION

INTERNATIONAL BALLOON RACE, BENNETT CUP SUMMARY. The competition for the Gordon-Bennett Cup for spherical balloons in 1912 resulted in the breaking of the world's record of 1211 miles made by M. Émile Dubonnet January 7-8 in the balloon *Condor III.*, and a new record of 1361 miles by the French balloon *Picardie*. Twenty balloons participated in the contest which was started at Stuttgart, Germany, on October 27. The cup which was held by Germany by virtue of the success of the balloon *Berlin II.* with Lieutenant Hans Gericke, pilot, in 1911, was won by France for the first time. The following is a summary of the eight balloons which accomplished over 745 miles each: *Picardie* (France)—M. Maurice Bienaimé, pilot; M. Rumpelmayer, aide; landed near Moscow, Russia, October 29, distance 2191 kilometers (1361½ miles). *Ile de France* (France)—Alfred Lablanc, pilot; landed near Moscow, Russia, October 29, distance 2001 kilometers (1243½ miles). *Uncle Sam* (United States)—H. E. Honeywell, pilot; landed near Dukhty, Russia, October 29, distance 1056 miles. *Frankfurt* (Austria)—F. H. Lenhart, pilot; landed at Rosenofskoy, Russia, October 28, distance 1769 kilometers (1100 miles). *Zurich* (Switzerland)—Victor de Beauclair, pilot landed in Russia October 28, distance 1523 kilometers (946½ miles). *Reichsfugverein* (Germany)—Otto Korn, pilot; landed near Dukhty, Russia, October 28, distance 1385 kilometers (860¼ miles). *Minckelers* (Belgium)—F. Gérard, pilot; landed near Riga, Russia, October 28, distance 1291 kilometers (802½ miles). *Honeymoon* (England)—Jean de Francia, pilot; landed at Breslau, Germany, October 28, distance 1253 kilometers (778¼ miles).

The other competitors with less distances to their credit were:

Busley, Austria; *Azurea*, Switzerland; *Hamburg III.*, Germany; *Andromeda*, Italy; *Graf Zeppelin*, Denmark; *Belgica II.*, Belgium; *Libia*, Italy; *Million Population Club*, America; *Bearn*, France; *Astarte*, Austria; *Helvetia*, Switzerland; and *Dusseldorf II.*, loaned by Germans to America.

The *Dusseldorf II.*, which was loaned by Germans to the United States to replace a balloon destroyed previous to the competition, was piloted by John Watts with Arthur T. Atterholt as aide, and made a distance of about 1000 miles, landing at Pskov in Russia. This balloon was protested against and was duly ruled out of the race.

While trying out his new balloon *Berlin II.* preliminary to the Gordon-Bennett race, on October 20, Lieut. Hans Gericke, the well-known German aeronaut and the winner of the Bennett race at St. Louis in 1911, fell to his

death with his aide, Lieutenant Strahler, as a result of his balloon bursting. Lieutenant Gericke started out from Bitterfeld, and while above Spansberg, Saxony, at an elevation of about 6000 feet, approached a thunder shower and was caught by a sudden upward current which carried the balloon to a height of 15,000 feet in a very short period of time, as shown by the recording instruments. Either on account of the rapid expansion of the gas, or because it was struck by lightning, the balloon burst and the two men fell to their deaths at a terrific speed.

The National Balloon Race was held at Kansas City and was won by the balloon *Uncle Sam*, which subsequently participated in the International Balloon Race in Germany. This race was started on July 27 and with the exception of the *Uncle Sam*, which was in the air for two days, the other competitors landed on July 28. A summary follows: *Uncle Sam*—H. E. Honeywell, pilot; landed at Manassas, Va., distance 885 miles. *Kansas City*—John Watts, pilot; landed at Bellville, Mich., distance 625 miles. *Drifter*—Albert Holz, pilot; landed at New Berlin, Wis., distance 425 miles. *Million Population Club II.*—P. McCullogh, pilot; landed at Spring Green, Wis., distance 370 miles. *Million Population Club I.*—J. Berry, pilot; landed at Nord, Ill., distance 355 miles. *Goodyear*—G. M. Bumbaugh, pilot; landed at Pola, Ill., distance 330 miles. *Cole*—E. J. Custer, pilot; landed at McGregor, Iowa, distance 325 miles.

The various legal questions connected with aeronautics continue to arise and demand more or less complete solution from time to time. An international conference on legal questions of the use of the air met at Paris, but adjourned without coming to any definite conclusions. The prefect of police of the Department of the Seine found it necessary during the year to forbid the landing of aeroplanes within the limits of the city of Paris and also to prohibit their rising or descending from ground nearer than 1640 feet to any inhabited building except an authorized aerodrome within the limits of the department.

FATALITIES OF THE YEAR. The record of fatalities during 1912 contained an unusually large number of officers and men of the aviation corps of the different armies. In the United States one of the most notable accidents was that in which Miss Harriett Quimby, with A. P. Willard, was thrown from her 70 horsepower Blériot monoplane on July 1 at the Boston meeting. Miss Quimby had distinguished herself as the first aviatrix to fly across the English Channel and had made a record for herself in numerous flights. While the fatalities of the year in number exceeded those of previous years, yet when the total mileage was considered it would be found that there had been a great gain in safety and that conditions of construction and operation were better understood. There was a tendency to discourage sensational performances at public exhibitions, and the accidents that did occur were due to more normal circumstances.

AESTHETICS. See PSYCHOLOGY.

AFGHANISTAN. A central Asian monarchy, practically under British domination, and having foreign relations only with the Brit-

ish-Indian government. Capital, Kabul, with about 70,000 inhabitants. Area, about 225,000 square miles. The inhabitants, estimated at 5,000,000, belong mostly to the Sunni sect of the Mohammedans. The important industries are agriculture and stock-raising. The chief products and exports are cereals, lentils, fruits, live animals, raw wool, silk, carpets, and camels'-hair goods. Commercial relations are sustained with India and Russia. According to Indian statistics the imports into Afghanistan amounted in 1911 to \$774,396, and the exports to \$810,102. The trade with Russia is estimated at about 4,000,000 roubles imports and an approximate value exports. An indeterminate revenue is derived mainly from taxation on production, and its collection is marked by oppression and extortion. The loosely organized government is headed by an ameer (1912, Habib Ullah Khan; born 1872, succeeded his father 1901), who is granted a subsidy of Rs. 180,000 by the Indian government. His will is theoretically absolute and a condition of feudalism prevails.

ARMY. A standing army organized on a modern basis, with improved methods of training, was maintained under the command of the ameer's brother, Sardar Nasrullah Khan. Service is nominally obligatory, but to obtain the necessary strength only about one man in eight is called to the colors. This gives an establishment of about 27,000 infantry and 7000 cavalry, apart from a well-trained force of artillery armed with modern guns. There are irregular troops, including some 25,000 mounted men and a smaller force of infantry which would be joined with the regular army to give a war strength of about 80,000 horse and 60,000 foot. The manufacture of military supplies at Kabul, where small arms and ordnance shops were maintained, was carried on during the year, and the facilities for military transport and the improvement of the roads were advanced.

HISTORY. In the early summer a large number of the tribesmen of Khost, including the Ghilzais, revolted, and the ameer was slow in proceeding against them, being apparently afraid to trust his own troops. He was criticized for his inactivity, which was attributed by some to a desire on his part to pose as a champion of Pan-Islamism, the rebels being Mohammedans. Finally, the revolt was put down chiefly through the efforts of the Mullahs, and the governor of Khost was imprisoned at Kabul. Pacificatory measures were taken and the chief grievances were removed. Forced labor was forbidden and the taxes were reduced or abolished.

AGRICULTURAL CREDIT. Within the past two years keen interest has developed in this country in the provision of credit facili-

ties for farmers. This has been largely due to the active propaganda by former Governor Herrick, present ambassador to France, and Mr. David Lubin, organizer of the International Institute of Agriculture. Various investigations of the subject were in progress during the year. The Southern Commercial Congress sent a small body of representatives to study the subject in Europe. It also developed plans for a committee consisting of two members from each State of the Union to study European systems. This committee will attend the meeting of the International Institute of Agriculture in Rome in May, 1913. The American Bankers' Association in 1911 directed that an inquiry on this subject be made. At the same time the Department of State was interested and coöperated with the bankers' committee. Under the immediate direction of Ambassador Herrick a thoroughgoing investigation of systems of agricultural credit in various European countries was made and the results submitted to the government at Washington. So general became the interest in the subject that all three political parties embodied a plank in their platforms recommending the establishment of some system of agricultural credit suitable to American conditions. Finally in October President Taft took the first executive step in the direction of establishing such credit facilities in a letter to the governors. He urged that this be made a subject of consideration at the Congress of Governors in December. This was done. He expressed his belief that the coöperative credit societies of Germany, known as Raiffeisen banks, might be adapted to American conditions. He pointed out that the 12,000,000 farmers of this country pay interest charges estimated at \$510,000,000 per year. They are charged at the rate of 8½ per cent., as compared with 3½ per cent. to 4½ per cent. paid by French and German farmers. He thought it possible that such coöperative farmers' banks having been instituted, Congress might be induced to create also national land mortgage banks similar to the land credit banks of Germany and France.

PLANS PROPOSED. Among the various plans proposed for organizing rural credit are the following: 1. Extend the scope of national banking privileges by permitting banks to make loans on real estate, and develop the interest of State banks in farmers' business; 2. Establish government agricultural banks, or let the government guarantee private agricultural banks; 3. Provide for the organization of coöperative credit societies after one or more of the European plans.

With reference to the first of these plans it was pointed out that more than 2000 national banks are now located in towns of less than 6000 population and are therefore accessible to farmers. Similarly, several thousand State banks which are not hampered by loan restrictions are available. It is declared that farmers have not as yet strongly felt the need of better facilities. They now generally receive bank credit from merchants and implement dealers. The rapid development of manufacturing and commerce, together with the prosperity and individual character of our agriculture, has turned the attention of bankers to the development of facilities for trade and industry. Now that a great increase in

the use of machinery and fertilizers, a tendency toward larger farms and the introduction of modern business methods into agriculture are becoming prominent, it is argued that the banks will soon devise schemes to increase agricultural credit. That there was some truth in these contentions was shown by the organization of the first land-credit bank at Joliet, Ill. This was patterned after the *Crédit Foncier* of France. It planned to lend to farmers on long time at moderate rates of interest. The borrower was to have the privilege of paying interest and part of the principle every six months. The bank was to issue collateral trust bonds secured by farm mortgages and its capital of \$250,000. It was believed that these collateral trust bonds would become a common and much desired form of investment. Loans were to be made for as long as twenty years. The scheme showed that a loan of \$1000 bearing interest at $5\frac{1}{2}$ per cent. could be paid off in forty semi-annual installments, diminishing gradually from \$57 to \$24, and totaling \$1600. The second set of schemes was not widely advocated and was generally believed to be impracticable in this country. It was not believed desirable for the government itself to reënter the banking field in such manner nor to guarantee private banks, as is done by the government in Egypt.

EUROPEAN PLANS. The European schemes are of two general sorts: First, coöperative credit societies composed of peasant farmers, such as the *Raiffeisen* system of Germany; and second, land-credit banks formed by larger farmers, such as the *Landschaften* system of Germany, or by a banking corporation, as the *Crédit Foncier* of France. The former loan directly small sums for short periods to members only. The latter convert land mortgages into negotiable long-term bonds of convenient denominations for the general investor.

The *Raiffeisen* and *Schültze-Delitzsch* banks of Germany are formed on a strictly coöperative basis, no one but members being allowed to borrow, though non-members may make deposits. The former are organized by small farmers in rural communities and the latter by artisans and small tradesmen in towns and cities. They restrict their area of operations narrowly, including no greater territory than constitutes a neighborhood. This is necessary because all members assume unlimited liability for the debts of the banks. The capital is secured from savings, from loans, from the provincial bank of the district or from the central bank, and from certain small reserve funds. Thus in 1909 the total working capital of the 3000 *Raiffeisen* societies of Germany was 1,935,500,000 marks, of which 88.8 per cent. was provided by the savings and deposits of the farmers and the local public. The administration of these banks is simple, democratic, and practically gratuitous. They make loans in small amounts for short periods varying from a few months to a few years. Their average rate of interest is between 4 per cent. and 5 per cent., and the average credit advanced per member is 500 marks. They sometimes demand mortgage or collateral security, but rely chiefly on personal integrity, most loans being made on two-name paper. Their loans to members in 1909 on current accounts, similar to the Scotch cash credit, amounted to \$101,000,000 and those for fixed periods to about \$258,000,-

000. It is claimed that neither debtors nor creditors of these societies have lost anything since they first started in 1849. Local societies are organized into provincial banks and these in turn into a national federation with a central bank at its head. Societies similar to these coöperative credit groups are found in nearly every European country. Thus the Irish Agricultural Organization Society has over 200 affiliated credit banks.

The *Landschaften* is a somewhat similar system for the benefit of the larger land owners. They lend only to members, securing their funds by the issue of bonds in convenient denominations secured by mortgages on land and by the general assets of the association. There is, moreover, the unlimited liability of all the members. Like the former, these banks are not run for profit and pay no dividends. Their rate of interest has for many recent years been below $4\frac{1}{2}$ per cent. Their bonds sell freely on the German stock exchanges, with very slight variations in value.

The *Crédit Foncier* is a second form of land credit bank, similar in some respects to the *Landschaften* system. It serves as intermediary between land owners wishing to borrow on mortgages and persons with money to invest. Its function is the conversion of mortgages into negotiable form. Its method, therefore, consists in employing a body of experts to decide when loans should be made and to what amount and to issue against all mortgage loans negotiable bonds. These bonds have become such a favorite form of investment that the money market of the world has been made available for the French land owner. Their recent rate of interest on mortgage loans has been 4.3 per cent. The charter of the French institution limits its rate of profit to .8 of one per cent. These mortgage loans are made for long periods of time, averaging more than fifty years. The scheme provides for amortization, the semi-annual or annual payments covering both interest and a portion of the principle. Thus, on a loan at 4.3 per cent. interest running for 75 years the annual payment equals 4.48 per cent.; on one running 60 years the rate would be 4.66 per cent.; for 50 years, 4.88 per cent.; for 40 years, 5.25 per cent., and for 10 years, 12.4 per cent. The total loans of the *Crédit Foncier* December 31, 1911, equaled 6,147,000,000 francs. Most of this, however, represented loans on urban real estate.

JEWISH AGRICULTURAL AND INDUSTRIAL AID SOCIETY. This was an organization begun in 1911. It had headquarters at 174 Second Avenue, New York. It organized three "credit unions" in 1911 and five in 1912. Each union provides \$500 capital by selling shares of \$5 each to members; the aid society then lends to the union \$1000 at 2 per cent. interest. Loans cannot exceed \$100, nor extend beyond six months. Most loans are made on two-name paper. Up to the fall of 1912 these unions had a membership of 240 and outstanding loans of \$17,755.

AGRICULTURAL EDUCATION. The remarkable development in agricultural education in the United States during the past sixteen years is brought out by the following figures: In 1896 the institutions for agricultural education in the United States numbered 70; 61 State colleges of agriculture and 9

agricultural schools. At the present time there are 67 State colleges of agriculture, 42 privately endowed colleges giving instruction in agriculture, and upwards of 2500 secondary and elementary schools in which agriculture is taught, making in all about 2600 colleges and schools. This number does not include the many rural elementary schools in which some of the facts concerning agriculture are now taught as required by law or by official regulation in about one-third of the States. This period has also witnessed the development of almost the entire system of extension teaching in agriculture, with the exception only of farmers' institutes and the organization of numerous agricultural associations whose functions were primarily educational. The past year has been one of greater material progress in agricultural education than any of those which have preceded it.

IN FOREIGN COUNTRIES. Several agricultural schools were established and various phases of itinerant instruction and demonstration work in agriculture were inaugurated or extended. In Egypt private contributions amounting to about \$300,000 were made for the support of the school of agriculture at Ghizeh and three other agricultural schools, as well as for the establishment of new agricultural schools. The government also expended \$41,500 in this work. A department for special instruction in the wool and sheep industry was added to the curriculum of Sidney Technical College, New South Wales; a training farm for boys without means who wish to prepare for farming was provided for at Booborowie, South Australia; and plans were approved for the establishment of agricultural high schools at North Bundaleer and at Moorak, South Australia. An official report shows that there were 219 agricultural and forestry schools in operation in Austria in 1911; and 7 agricultural colleges, with an annual budget of \$192,000, and 32 agricultural schools, costing \$865,000 a year, in Hungary. The 1912 session of the Manitoba legislature separated the College of Agriculture from the University of Manitoba.

Following tentative experiments about four years ago, several European countries have seriously undertaken to give instruction in agriculture to soldiers in garrisons. In the four years Germany has given agricultural instruction in nearly every garrison in the empire. This instruction is usually given in winter, for one or two hours a week. France and Italy are other countries in which soldiers are instructed in agriculture, while Roumania reduces to one year the military service of graduates of elementary agricultural schools and others who can pass an examination equivalent to a year's work in these schools.

The Royal Agricultural College at Cirencester, England, incorporated its collegiate work with that of the University of Bristol, the plan being for students in agriculture and forestry to spend the first year in general science work at Bristol and the second and third years at Cirencester.

Many of the provincial agricultural schools in Italy established and equipped demonstration farms. By royal decree the higher council of agricultural, industrial, and commercial instruction was superseded by a council for agricultural instruction of fourteen members appointed by the minister of agriculture.

A new school of agriculture was established at San Francisco de Borja, Mexico, and a poultry school near the City of Mexico.

In Spain a large tract of land with extensive buildings was acquired for the site for an agricultural institute of instruction and experimentation.

EDUCATIONAL CONVENTIONS. The year 1912 was the fiftieth anniversary of the passage of the land-grant act of 1862, providing for the establishment of State agricultural and mechanical colleges in the United States, and the twenty-fifth anniversary of the Hatch act of 1887, providing for an agricultural experiment station in each State. The occasion was celebrated by the Association of American Agricultural Colleges and Experiment Stations at its annual convention in Atlanta, November 13-15, by the presentation of several historical papers.

At the annual convention of the National Education Association held in Chicago, July 6-12, one general session was devoted to the general topic, "Rural Life Conditions and Rural Education." The department of rural and agricultural education devoted one session to papers on the "Redirection of Rural Education," one to consideration of a report of its committee on a course of study in agriculture for high schools, and a third to a joint session with the School Garden Association of America, at which there were papers and discussions on rural and city school gardens, home gardens and experimental plots, and forestry in rural schools. A second meeting of the School Garden Association of America and the annual meeting of the American Nature Study Society were held in Cleveland during Convocation week.

The first conference of the International Association of Poultry Instructors and Investigators was held in London July 18-24, with twenty-seven countries represented. A permanent organization was effected, with E. Brown, of London, as president, and Dr. Raymond Pearl, of Orono, Me., as secretary.

At an educational conference held in connection with the Royal International Horticultural Exhibition, Chelsea, England, May 23, papers on horticultural education in their respective countries were presented by Dean L. H. Bailey, of New York State College of Agriculture, Ithaca, N. Y.; K. Weinhausen, of Berlin, and Prof. A. Buysens, of the School of Horticulture, Vilvorde, Belgium.

Over 200 delegates representing the agricultural committees of bankers' associations in 22 States met at Minneapolis and St. Paul August 7-8 to discuss agricultural education and improvement. A silver trophy offered to the State committee making the largest contribution for agricultural education and improvement was awarded to the committee of North Dakota, which reported financing the better-farming association of that State to the extent of \$45,000, besides giving \$5000 for farmers' institutes and \$5000 for corn-growing contests, in which over 11,000 men and boys participated.

UNITED STATES OFFICE OF EXPERIMENT STATIONS. This office, as heretofore, represented the United States Department of Agriculture in its relations with agricultural colleges and schools, published the official statistics and organization lists of the State agricultural col-

leges and experiment stations, issued annual reports of progress in agricultural education and farmers' institutes, edited a chapter on agricultural education each month in the *Experiment Station Record*, and issued other educational publications as follows: Bulletins—"Agricultural Schools in Arkansas," "Some Types of Children's Garden Work," "Proceedings of the American Association of Farmers' Institute Workers"; Farmers' Institute Lectures—"Farm Homes," "The Peanut," "Farm Home Grounds"; circulars—"Report of Committee on Instruction in Agriculture," "A Working Erosion Model for Schools"; reprint—"The Occupation of the Agricultural College Graduate."

Special studies were made of the eleven agricultural schools in Georgia and of other isolated schools and types of instruction in agriculture in California, Oregon, New York, and elsewhere.

UNITED STATES BUREAU OF EDUCATION. A specialist in rural education was added to the staff of the bureau, statistics of the agricultural and mechanical colleges were published, and bulletins were issued relating to courses of study for rural schools teachers, agricultural education in secondary schools, teaching language through agriculture and domestic science, the readjustment of a rural high school to the needs of the community, and a bibliography of education in agriculture and home economics.

GRADUATE SCHOOL OF AGRICULTURE. The fifth session of this school was held in July, under the auspices of the Association of American Agricultural Colleges and Experiment Stations, at the Michigan Agricultural College, East Lansing, Mich. The faculty included Dr. A. C. True, director of the United States Office of Experiment Stations, as dean; forty-eight specialists in the regular courses of the school, and six speakers at special conferences. Three members of the faculty were from European institutions, viz.: Dr. E. J. Russell, director of the Rothamsted Experiment Station, England; Dr. F. H. A. Marshall, of Cambridge University, England, and Dr. Oscar Loew, of the Munich Hygienic Institute, Germany. One hundred and eighty students were enrolled.

THE AGRICULTURAL COLLEGES. The agricultural colleges continued their rapid advance in the enrollment of students, the erection of buildings and the securing of more liberal funds. For example, New York State College of Agriculture was given appropriations aggregating \$907,000, including the following large items: Forestry building, \$100,000; agronomy wing, \$100,000; animal husbandry laboratory, \$91,000; livestock judging pavilion, \$38,000; current expenses, \$265,000; extension work, \$50,000. At the same institution the following buildings were being constructed: Agricultural auditorium, \$130,000; poultry building, \$90,000; home economics building, \$150,000.

Among other examples of material prosperity the following biennial appropriations for agricultural colleges are noteworthy: Georgia, \$250,000; North Carolina, \$220,000; North Dakota, \$200,000; New Jersey, \$100,000 for an agricultural building and \$29,000 for other improvements; New Mexico, \$30,000 for a science hall; Rhode Island, \$75,000 for a science building; South Dakota, \$100,000 for an agricultural

building; Washington, \$150,000 for an agricultural building. The Massachusetts Agricultural College erected a \$75,000 dairy building, the Missouri College a \$60,000 agricultural-chemistry building, and the Minnesota College a large agricultural-engineering building. The new agricultural building at the University of California was dedicated November 20, and Dr. Thomas F. Hunt was installed as dean of the College of Agriculture. Fires destroyed the main building of the Texas Agricultural and Mechanical College, causing a loss of \$100,000, and the main building and the dormitory of the Maryland Agricultural College, valued at \$250,000.

The principal lines of development in the work of the agricultural colleges were in providing better facilities for the training of teachers of agriculture and in strengthening the extension work in agriculture. Larger specific appropriations for extension work, both federal and State, made it possible to employ additional men and women for the extension departments of the colleges and to inaugurate several new features of extension work, chief among which was the county and district system of advisory bureaus for farmers, in which the United States Department of Agriculture, the State agricultural colleges, and other agencies co-operated. One of the largest of the coöperative extension enterprises was the boys' and girls' agricultural club movement. Over 90,000 boys were engaged, North and South, in the corn, Kafir corn, and cotton club work, in which the United States Department of Agriculture coöperated, and there were over 40,000 other boys in the North who were members of corn clubs, wheat clubs, or potato clubs, or were engaged in other agricultural contests. In the Southern corn club work several boys secured yields of over 200 bushels per acre, while in the North many yields ran over 100 bushels. Illinois reported over 50 yields running above 100 bushels, and Ohio 91 such yields. Ohio sent 225 prize winners on a free trip to Washington. There were also more than 23,000 members of girls' canning and poultry clubs in 12 Southern States. Each member of a canning club cultivated 1-10 acre of tomatoes, kept account of labor, expenses and income, and from these computed net profits. The lowest average net profit per 1-10 acre for all of the girls in a State was \$14.57, while the highest was \$40.00. One girl raised 5928 pounds of tomatoes on her plot, while another filled 1525 quart cans of tomatoes from hers.

SECONDARY SCHOOLS. The number of colleges and schools offering secondary courses in agriculture increased in nearly all parts of the United States. New State schools of agriculture were established in Colorado, Nebraska, and New York, the legislature of the latter State making provision for an agricultural school on Long Island. A school of agriculture was organized in connection with the Chautauqua Institute, Chautauqua, N. Y., on a 110-acre farm adjoining the institute grounds. A grant of \$250,000 by the General Education Board was made to the George Peabody College for Teachers at Nashville, Tenn., for the establishment of the Seaman A. Knapp School of Country Life, which will give special attention to the training of teachers for

CORN CLUB BOYS FROM BALTIMORE COUNTY, MARYLAND, VISITING THE SECRETARY OF AGRICULTURE

ROSEDALE SCHOOL GARDEN, CLEVELAND, OHIO
AGRICULTURAL EDUCATION

1900

rural schools. This grant was made contingent upon the raising of an equal sum by the institution.

In Louisiana the legislature increased the appropriation for agricultural schools from \$25,000 to \$50,000. A \$40,000 science building was erected at the Minnesota School of Agriculture, Crookston.

Many public high schools established courses in agriculture during the year and many others announced their intention of inaugurating similar work as soon as satisfactorily trained teachers could be found. The system of giving bonuses to schools employing teachers of agriculture, as inaugurated in about a dozen States, gave much satisfaction. It was found that under this system better trained teachers were employed, better equipment provided, and better supervision was possible. Progress was also made in the development of elementary courses in agriculture in the rural elementary schools. This was particularly true where boys' and girls' contests and exhibitions were conducted.

AGRICULTURAL EXPERIMENT STATIONS. **EXTENSION OF THE WORK.** In the fiscal year 1911 the appropriation under the Adams act of 1906 reached its maximum of \$15,000 to each State, giving an annual aggregate of \$720,000 to be devoted exclusively to original research on agricultural problems. The Hatch fund is also supporting a large amount of experimental work. Progress is being made in confining the work of the stations to more thorough investigations by an elimination of the simple tests and demonstrations, as well as the dissemination of general agricultural information. This is being helped by the rapid organization of extension divisions in the agricultural colleges, which are taking over the informational functions hitherto performed by the stations. There is a growing tendency to make permanent State appropriations for station work and larger amounts are being given by the States for local experiments. In California a citrus-fruit substation has been located at Riverside; in Massachusetts a substation for cranberry culture has been established at East Wareham; in Missouri a poultry station has been established at Mountain Grove; in Oregon and South Dakota dry-farming substations have been provided for; in Texas a substation for tobacco culture has been established. In Ohio, South Dakota, and Wisconsin provision has been made for county experiment farms and for the experimental use of farms connected with public institutions. In Utah demonstration farms located on sagebrush lands have shown that such lands can be profitably handled under dry-farming methods, with the result that these lands are being largely taken up for agricultural purposes.

FEDERAL AND STATE STATIONS. Agricultural experiment stations maintained in whole or in part by federal funds now exist in every State and Territory, including Alaska, Hawaii, Porto Rico, and Guam. There are also stations in the Philippines under the insular government. In 1911 the stations employed 1567 persons in the work of administration and inquiry, as compared with 628 in 1897. Likewise, in 1897 the stations had a total income of \$1,129,833, of which \$720,000 was derived from the Hatch act, while in 1911 their total income was

\$3,662,425, of which \$1,440,000 was received from the United States and the Hatch and Adams acts. The value of the additions to station equipment in 1911 aggregated \$939,705, of which \$448,708 was for buildings. In addition to this, the Office of Experiment Stations in 1911 had an appropriation of \$424,000, including \$30,000 each for Alaska, Hawaii, and Porto Rico stations; \$15,000 for the Guam station; \$15,000 for nutrition investigations; \$100,000 for irrigation investigations; \$100,000 for drainage investigations, and \$10,000 for investigations of farmers' institutes and agricultural schools, together with \$4727 derived from the sale of agricultural products at the insular experiment stations. In Alabama, Connecticut, Hawaii, Louisiana, Missouri, New Jersey, New York, North Carolina, and Virginia separate stations are maintained wholly or in part by State funds and in a number of States substations are maintained. Excluding substations, the total number of stations in the United States is 65, of which 54 receive federal funds. In 1911 the stations published 566 annual reports, bulletins, and circulars, which were supplied to over 1,000,000 addresses on the regular mailing lists. The correspondence with farmers is enormous and constantly increasing.

OFFICE OF EXPERIMENT STATIONS. This office has general supervision of the federal funds granted to the stations, annually inspects them, approves projects of investigation under the Adams act, and gives the stations advice and assistance in a great variety of ways. The annual report of this office contains summary descriptions of the work of each station, detailed statistics of the agricultural colleges and experiment stations, and articles on the progress of agricultural education, farmers' institutes, and extension work in this country and abroad. The review of the world's literature of agricultural science in the *Experiment Station Record* is increasingly comprehensive. Two volumes of this journal are now issued annually, containing over 7500 abstracts. The 26 volumes thus far issued contain references to over 90,000 articles, besides editorials, special articles, and notes. Two general indexes covering 25 volumes have been issued. The card index of the literature of the American stations issued by this office now contains over 32,000 cards and is being widely used by students. Copies of this index are deposited in the libraries of the agricultural colleges, experiment stations, and State departments of agriculture. The special investigations in charge of this office, for which its income in 1912 aggregates \$335,060, are in five main lines: (1) Maintenance of experiment stations in Alaska, Hawaii, Porto Rico, and Guam; (2) agricultural education (q. v.); (3) food and nutrition (q. v.); (4) irrigation (q. v.); (5) drainage (q. v.). See also AGRICULTURAL EDUCATION.

RECENT EXPERIMENTS. The soil investigations of the Illinois station have so far resulted in increasing the yield of staple crops that farmers and business men are convinced that by proper management soil fertility can be maintained and increased, and the principles advocated by the station are being applied to practice by leading farmers throughout the State. The Missouri station has determined that nitrogen and phosphorus are the limiting

elements of plant food in Missouri soils and that the majority of Missouri uplands respond to an application of these elements. The Ohio station found that there is a direct relation between the supply of available phosphorus in the soil and the phosphorus content of wheat. The Wisconsin station found that bacterial activity in the soil may so change the nature of substances in solution in soil water as to exert an influence on evaporation.

The Missouri station has shown that maintaining young heifers on a high plane of nutrition does not affect their milking qualities and that the size of the cow may be permanently increased by liberal feeding when young. In experiments to determine the efficiency of mitigated cultures of human tubercle bacilli as a vaccine against bovine tuberculosis, it was found that vaccinated cattle contracted the disease when exposed to infected animals even under the favorable conditions of outdoor life. The fecal excretions of tuberculous cattle were a much more important source of infection to swine than foods contaminated with the saliva of tuberculous cattle. Not only a very large percentage of the pigs fed behind tuberculous cattle became diseased but some of the pigs showed well-developed tubercular lesions in less than four weeks of exposure. The Indiana station has shown that an excess of soft fats and a large average of fat globules in cream materially increase the moisture absorbing and retaining property of butter, while the acidity of cream, the size of butter granules, the temperature of the wash water, the use of the dry or wet salting method do not appreciably affect the moisture content of the butter. The results of twenty years' spraying work with Bordeaux mixture on late potatoes by the Vermont station showed an average gain of 105 bushels per acre.

In Alaska the experiments with cattle and sheep on the island of Kodiak were seriously interfered with by the eruption of Mt. Katmai, 95 miles distant. Ashes covered the pastures to an average depth of 14 inches, making it necessary to remove the cattle to the State of Washington for the winter. It has been ascertained that the volcanic ash contains no substance deleterious to plants, and experiments are being made in plowing the land and seeding to grasses, clover, and grains. At Rampart several farms of alfalfa survived the winter and made good growth the following summer. The breeding of varieties of barley better adapted to the climate at Rampart promises to be a success. Winter rye proved hardier than winter wheat in that locality. At Fairbanks considerable quantities of potatoes and hay were produced and brought high prices in the local market.

In Hawaii the work of the station has resulted in making the pineapple industry second in importance in the Territory, and the area devoted to pineapples is being rapidly increased. Breeding experiments to secure a strain of pineapples less subject to the deleterious effects of manganese in the soil are being continued. The demonstration farms established on the islands of Hawaii, Maui, Kauai, and Oahu are collecting much information which will aid in diversifying the agriculture of the Territory.

In Porto Rico experiments with citrus fruits,

mangoes, coconuts, yams, yantias, dasheens, and sweet potatoes are giving valuable results. The improvement of the livestock of the island by the importation of horses, cattle, and poultry is making good progress. The calves obtained from half-bred Zebu bulls are much larger, hardier, and make more rapid growth than pure native-bred calves.

In Guam the pineapples and avocados introduced from Hawaii are doing well. Continued cultivation is giving better results with corn, sorghum, Kafir corn, Para grass, and other food and forage plants. A preliminary survey of the insect fauna of the island has been made.

Outside of the United States stations have recently been established at Linz, Austria; La Rioja, Argentina; Therezina, Brazil; Forts Resolution, Smith, and Providence, Canada; Rosthern, Saskatchewan, Canada; Wilmer, British Columbia; Kentville, Nova Scotia; San José, Costa Rica; Carcassonne, France; Kissidongon and Mamou, French Guinea; Bettiah Estate, Bengal, India; Gwibi, Rhodesia; Burgos and Pontevedra, Spain. Special stations have also been established for cacao at São Antonio, Brazil; for rubber at Isororo, British Guiana; for viticulture at Toulouse, France, and Madrid, Spain; for forestry at Chimnitz, Hungary; for beet culture at Rovigo, Italy; for mulberries at Ascoli, Italy; for agricultural chemistry, vegetable pathology, and entomology at Fort-de-France, Martinique; for cotton at Port Herald, Nyasaland; for olives at Tortosa, Spain. Greece has established a ministry of agriculture and commerce and the Grecian agricultural society has established experiment stations. The agricultural work carried on by the ministry of public works of Peru has been reorganized and a central agronomic station established at Santa Beatriz, near Lima.

AGRICULTURAL LEGISLATION. FEDERAL LEGISLATION. Agricultural measures received unusual consideration from Congress during 1912. After several years' effort to obtain legislation to protect this country from the introduction of dangerous insects and plant diseases through the importation of infested nursery stock and similar products, a plant quarantine act was adopted and became effective October 1. Under its provisions a permit must now be obtained from the Secretary of Agriculture to import nursery stock, as well as a certificate of inspection in the country of export. Subsequent interstate movements of the nursery stock must also be reported to the secretary. A similar procedure may also be required as to imported fruits, vegetables, seeds, etc., in case their unrestricted entry becomes prejudicial. If deemed necessary in order to check the introduction of a new pest, the Secretary of Agriculture may exclude entirely importations likely to transmit it, and may quarantine any State or section as regards interstate shipments. A foreign quarantine has already been declared against the white pine blister rust and potato wart, against Hawaiian products because of the Mediterranean fruit fly, and against certain New England evergreens and other material likely to disseminate the gipsy and brown-tail moths. The administration of this act is entrusted to a federal horticultural board, composed of offi-

cials of the federal Department of Agriculture, but the inspection work is wholly in the hands of the State authorities.

A standard apple barrel, containing 7056 cubic inches, has been established, as well as standard grades for apples on the basis of variety, size, and quality. After July 1, 1913, the shipment in interstate commerce of barrels will subject the sender to prosecution for misbranding, unless the fruit and barrels conform to the requirements. The importation into the United States of grain and grass seed deemed adulterated or otherwise unfit for seeding purposes has been prohibited after February 24, 1913.

The so-called Lever bill, carrying an ultimate appropriation of about \$3,500,000 per annum to the States for the maintenance of agricultural extension work through their agricultural colleges, passed the House of Representatives in August and was favorably reported in December by the Senate committee on agriculture and forestry. There was also pending in the Senate the Page bill, which not only provides federal aid for extension work but also for instruction in secondary schools in agriculture, industrial training, and home economics, the training of teachers in these subjects and the maintenance of branch experiment stations, with an ultimate expenditure of about \$15,000,000 per annum.

A resolution establishing a commission to investigate the workings of coöperative rural credit unions and land mortgage banks in foreign countries was adopted by the Senate. Favorable committee reports were made on bills to provide for grain inspection and to prevent gambling in agricultural commodities. Determined efforts to secure a reduction of the revenue tax of 10 cents a pound on colored oleomargarine were being sharply contested by the dairy interests.

STATE LEGISLATION. In about two-thirds of the States no sessions of the legislatures were held in 1912 and the amount of legislation in others was comparatively small.

Arizona and New Mexico on attaining statehood enacted complete irrigation codes, and the former also passed a pure food law. Maryland and Virginia revised their fertilizer and drainage laws, and Maryland and New York provided for seed inspection. In New York after July 1, 1913, food products must be sold in standard containers or labeled to show the net weight or volume; and Massachusetts required sales by weight of such commodities as potatoes. Important changes in the system of taxing lands suitable for forestry were initiated in New York. Land deemed suitable for forest growth by the State Conservation Commission may now be assessed during maintenance as forests on the basis of the land value alone, and if handled under the supervision of the commission may be exempted entirely for 35 years. A stumpage tax of 5 per cent. is levied on the timber upon cutting. In Massachusetts an amendment to the constitution giving to the legislature authority to enact similar laws was adopted by a large popular vote. New York also authorized its counties, towns, and villages to acquire and operate forests and its counties to employ agricultural advisers. An unsuccessful attempt was made to require stallion registration in that State, but \$5000 was

obtained for promoting horse breeding in the State. The Massachusetts cattle bureau was converted into a bureau of animal industry.

FOREIGN LEGISLATION. The Canadian government nearly trebled its appropriations for agriculture granting for 1912-13 nearly \$4,500,000. Of this sum, \$1,500,000 is to be used for acquiring terminal grain-elevators under what is known as the Canadian grain act of 1912, which also regulates the grading, storing, transporting, and marketing of grain. Provision was made for extending the rural mail service; \$500,000 was granted for allotment to the provinces for use in encouraging agriculture, and increased aid was given to the system of experimental farms.

In Great Britain a division of horticulture was established in the Board of Agriculture and Fisheries, and a number of agricultural research institutions were located under the development act of 1908. A commissioner of agriculture was provided for Wales, and a Welsh agricultural council was under consideration. The French pure food laws were extensively revised. The system of agricultural instruction was also reorganized, and commissions were authorized to study and combat plant and animal parasites and to classify useful and injurious birds. A law granting subsidies to breeding associations, agricultural societies, and others interested in livestock improvement was enacted in Denmark. Russia readjusted its tariff rates to encourage the importation and manufacture of agricultural machinery. Uruguay took similar action as to imported seeds and agricultural implements, and Nicaragua as to commercial fertilizers.

AGRICULTURAL TRAINING FOR FACTORY CHILDREN. See CHILD LABOR.

AGRICULTURE. The year 1912 was an anniversary year for American agricultural institutions. It was the semi-centennial of the establishment of the federal Department of Agriculture at Washington, and of the Morrill act donating public lands for the establishment and maintenance of agricultural colleges in all the States and Territories. It was likewise the fiftieth anniversary of the homestead act, which provided for cutting up the public domain into farms and its settlement by farmers who live on the land. It is a strange coincidence that these three measures of such vital and far-reaching importance to the agriculture of this country, and which had been for some time national issues, should have been passed and signed by President Lincoln within a few weeks of each other, at a time when the country, in the midst of a great civil war, was struggling to maintain the Union. Twenty-five years later, in 1887, the act was passed making provision for a system of agricultural experiment stations, and hence the year 1912 marked the twenty-fifth anniversary of its birth.

These are the most important events in the history of American agriculture. They have resulted in the largest and most influential movement in education, the most highly developed department of agriculture, and the most comprehensive and efficient system of experiment stations to be found in any country. They have placed agriculture on a new basis, as an enlightened and progressive industry, and have marvelously improved its efficiency and its ability to meet the demands of a stead-

* Data for countries in the southern hemisphere represent estimates on the crops harvested 1912-13.

ily growing population. The anniversary of these events was observed by the Association of American Agricultural Colleges and Experiment Stations at its annual convention in Atlanta in November.

CROP PRODUCTION IN THE UNITED STATES. The year 1912 was the most productive of all agricultural years in the United States. The crops of corn, hay, potatoes, oats, barley, rye, flaxseed, and beet sugar were the largest ever raised, while the cotton crop, it is estimated, is the second largest. Rice and buckwheat have only been exceeded once, and wheat and tobacco are third in size. All of the cereals showed increases over 1911, which was a year of low production, the average increase being 30 per cent. Hay increased 52.7 per cent., potatoes 41.5 per cent., corn 25.2 per cent., wheat 15.9 per cent., oats 53.7 per cent., and barley 40.2 per cent. over 1911. The prices at the farm were generally good, and will continue the prosperity that farmers have enjoyed in recent years. The total value of all crops was \$6,137,000,000, an amount which is vastly above the highest previous mark, that of 1911. The farm value of the dairy products is estimated at about \$830,000,000, an amount which exceeded the value of the cotton lint and nearly equaled that of the hay crop; while the products of the poultry industry were worth at the farm about \$570,000,000. The latter value has been exceeded in two former years. Wool production has apparently been exceeded in two former years, yet in 1912 it amounted to 318,548,000 pounds. This wool had a farm value of about \$55,500,000, or about 6 per cent. below the average value of the wool clip of the five preceding years.

The animals sold from the farm and the animals slaughtered on it together numbered about 111,000,000 for 1912, and had a value of about \$1,930,000,000. This is the highest value of animals sold and slaughtered since about 1900, except in 1909 and 1911. The total value of the animal products in 1912 is estimated at about \$3,395,000,000. This is a larger value than that of 1911, but is about \$150,000,000 below the value for 1910, which is the only year which exceeded 1912.

The grand total for the production of farm products, crop and animal, in 1912, is estimated at \$9,532,000,000, the highest value yet reached by a half billion dollars. It is more than twice the value of farm production in 1899, according to the census, and is about one-eighth more than in 1909.

FOREIGN TRADE IN AGRICULTURAL PRODUCTS. For the fourth time the value of agricultural exports of the United States exceeded a billion dollars, or enough to pay the expenses of the national government. The billion-dollar mark was reached in 1907, when the value of agricultural exports amounted to \$1,054,000,000. That amount has not since been equaled, but the exports of 1908 and 1911 exceeded a billion dollars in value, and in 1912 the amount fell short of the record mark by only \$4,000,000.

Cotton represents the largest agricultural export, and showed a marked increase in 1912. Wheat flour still maintains a high relative position, the exports of wheat and the flour which it represented amounting to 80,000,000 bushels in 1912. Apples are supporting an increased export trade, which now amounts to about \$10-

000,000; while prunes and raisins show steady increases, representing several million dollars a year. On the other hand, beef and its products have greatly declined in the export trade. Packinghouse products have declined in value of exports since 1906, when they reached their highest value, \$208,000,000, and have declined still more in quantity because of increasing prices, but they showed a value in 1912 of \$164,000,000. Their value has increased since 1910. The export of forest products marked the highest value ever reached, \$108,000,000, due partly to high prices and partly to increased volume.

Imports of agricultural products in the United States are steadily increasing in value, reaching the highest point in 1912, when they amounted to \$784,000,000. Notable increases occurred in coffee, sugar, molasses, tobacco, wool, and packinghouse products, in which hides and skins were very prominent. Since 1908 the balance in the foreign trade in agricultural products has not kept up to its former figure, but this is not due to diminished export values but to a greater increase of imports. Notwithstanding this, the balance in favor of exports of farm products was \$278,000,000 in 1912, and this was higher than the amounts for 1909 and 1910.

WORLD'S PRODUCTION OF CROPS. In general, European crops in 1912 suffered from a cool and backward season, and later from very rainy and otherwise unfavorable weather at the time of harvest. This is true for practically every country excepting Italy, in which a serious drought during the growing season reduced crop production. The untoward weather conditions influenced both yield and quality, but in general the quantity produced more than met expectations. The reductions in yield have been marked enough, however, to increase perceptibly the requirements of all grain import countries, and this condition was reflected in a brisk export movement of wheat in the United States during the fall of the year, more particularly during the month of October. The wet weather at the time of the European harvest was particularly injurious to oats and barley and the hay crops, which were to a large extent discolored by rain while standing on the fields awaiting stacking or thrashing.

England suffered from the most blighting spring drought that has afflicted that country for a decade. Throughout Great Britain the season was decidedly unfavorable. Following the severe drought of 1911, the rainfall in 1912 was so heavy and prolonged as to do much damage to crops. All cereals suffered severely, potatoes were badly affected by disease, hay was of poor quality, and pastures were flooded.

A severe drought prevailed in South Africa, including Natal, Transvaal, and the Orange Free State, seriously affecting the agricultural and grazing interests. Deaths of sheep from lack of grass ran into hundreds of thousands, many cattle were sacrificed, and a large portion of the growing crops were a total failure.

WORLD'S PRODUCTION OF RUBBER. The total world production of wild and plantation rubber for the year ended June 30, 1912, amounted, according to the statistics of Hecht, to 93,669 tons, as compared with 79,302 tons in the previous year and 76,026 tons in 1909-10. The consumption in 1911-12 is given as 99,564 tons, as contrasted with 74,082 tons in 1910-11. Ex-

periments in rubber growing in Hawaii, conducted by the Federal Experiment Station, have given very encouraging results. Rubber of a high quality has been produced, only 10 per cent. below Para rubber. The high price of labor in the islands is regarded as the most serious drawback. Several plantations on a considerable scale have been established. The production of rubber synthetically is one of the notable accomplishments of chemistry during the year. See CHEMISTRY, INDUSTRIAL.

WORLD'S PRODUCTION OF SILK. According to statistics of the Silk Merchants' Union of Lyons, France, the world's production of raw silk was approximately as follows: Western Europe 9,557,038 lbs., Levant and Central Asia 6,206,012 lbs., extreme Orient 36,717,986 lbs.; grand total 52,481,036 lbs., as compared with 54,002,227 lbs. in 1910.

FOREIGN STATISTICS AND DEVELOPMENT. Revised statistics of the census of England and Wales show that in 1911 78 per cent. of the population was living under urban and only 22 per cent. under rural conditions, while 60 years ago the population was about evenly divided between town and country. There was an increase of over 36,000 acres in the arable area, and a decrease of 115,400 acres in the area under permanent grass. Statistics presented at the British Association show that the United Kingdom produces rather more than one-half of its total food supply exclusive of sugar and such beverages as tea and coffee, which cannot be grown. Only in the case of wheat was a large falling off noted; barely one-fifth of the total wheat consumed is produced in the country. The development of agriculture in the valley of the Amazon is contemplated in a decree of the Brazilian government which proposes concessions to certain agricultural or breeding undertakings located there, in the form of exemption of import duties on machinery and materials, premiums on land sown to food-stuffs, and on the production of preserved milk, meat, etc., for five years. Notable progress was made in Uruguay during 1911 in the conversion of land formerly devoted to stock-raising into cereal production. To encourage this movement the government is arranging a plan to lend money to farmers who may have had a poor crop or desire to hold for a better market. Two American dry-farming experts have been engaged by the government, who are teaching modern methods by lectures and demonstrations. Other agricultural specialists are being engaged. An agricultural defense bureau was organized at the close of 1911, with divisions for economic entomology and plant pathology, and the director was sent to the United States to study methods of organization and work. Inspection against the importation of diseases and insects in seeds, plants, etc., is provided. Coffee growing has been started in Paraguay, the experimental plantations having shown it to be a suitable crop. The individual holdings are small as yet. It is estimated that half a million trees will soon be in bearing in the Department of Altos.

The Grecian government is making a determined effort to promote the agriculture of Greece, which is in a very backward condition. Foreign agricultural experts are being employed to organize in different branches of agriculture, the government has undertaken the drainage of large marshes which cannot be left to local

initiative, and an effort is being made by the Ministry of Agriculture and Commerce to increase the cultivation of cotton and to improve its quality. A factory for making artificial fertilizers has been opened. A report of the Department of Agriculture for British East Africa indicates a hopeful outlook for the agricultural development of that country, there being a large influx of money for developments in many branches of farming, a continued influx of settlers, and an increase of land values and of exports. There has been a marked increase in the acreage of rubber, sisal, sem sem, and other tropical crops, and marked progress is noted in animal husbandry, especially in the raising of pure-bred and graded wool sheep.

A movement is said to be on foot in the Philippines for the government to engage in rice growing on a wholesale scale. Since 1898 it is reported \$82,000,000 has been sent out of the country to purchase rice. In the fiscal year 1912, \$10,000,000 worth of rice was imported. The crop the past year was the shortest of recent years. A campaign has been carried on to generalize the use of Indian corn, or maize, as a food substitute for rice. The animal importation of rice into the islands has varied in the past thirteen years from 100,000 to 250,000 tons. To produce this quantity would necessitate an increase in the area planted to rice of about 600,000 acres, or improvement in present methods which would give a corresponding increased production. The principal exports from the Philippines in the fiscal year 1912 were copra \$16,514,749, hemp \$16,281,830, sugar \$10,400,575, and cigars \$2,660,000.

FARM TENACITY. The census returns show that there has been an uninterrupted increase in the proportion of tenancy in the United States for the last thirty years. In 1880 out of each 100 farms 25 were operated by tenants, by 1890 the number had risen to 28, by 1900 to 35, and by 1910 to 37. The rate of increase, however, seems to be decreasing, as indicated by the last census, there being actual decreases in the proportion of tenant farms in some of the geographical divisions, the proportion varying in many cases with the value of land per acre, the value of farms as units, or the character of farming.

A special committee appointed to inquire into the condition of tenant farmers in Great Britain and consider needed legislation, submitted a report to Parliament during the year. It was found that a large number of estates are being broken up and sold, the reason assigned being apprehension among the landowners as to the probable tendency of legislation and taxation in regard to land, and a belief that land at present is let at rates below its economic value. The committee recommended that the twelve months' notice of termination which has been customary should be extended to two years, and that a scheme of state-aided purchase should be instituted.

ECONOMICS OF PRODUCTION AND DISTRIBUTION. The cost of producing crops on irrigated and non-irrigated lands is the subject of an inquiry by the Bureau of Statistics of the United States Department of Agriculture, 73 farms being considered in the case of wheat, 104 of oats, 119 of alfalfa, and 7 of potatoes. The cost per bushel of wheat was 22.9 cents on irrigated land and 26.3 cents on non-irrigated; oats 11.2 cents on irrigated and 9 cents on

non-irrigated; alfalfa \$2 54 per ton on irrigated and \$1.54 on non-irrigated; and potatoes 25.3 cents per bushel on irrigated and 39.2 cents on non-irrigated.

The Canadian Conservation Commission has issued a report which deals, among other things, with an agricultural survey made of 1212 farms in the various provinces. One object was to determine whether the fertility of the land was being conserved. There was found to be hardly any systematic conservation of fertility outside of Ontario, but that in most of the provinces the farmers are living on the accumulated capital provided by nature, thereby leaving their lands poorer. The yield of crops per acre in Canada on the whole was pronounced unsatisfactory. Already the effect of the soil-robbing system is apparent in Manitoba; not a single farmer reported an increase in yield per acre, and 46 per cent. reported an actual decrease. In Ontario about half the farmers follow a systematic rotation, but elsewhere the percentage was found to be very small. The indication of certain superior farms as "illustration farms," and provision for extending aid and supervision to them, was decided upon. It was stated that if all the farmers would follow the systems and methods of 10 per cent. of the farms examined, production would be doubled in ten years.

The purchasing power of an acre has been calculated by the Bureau of Statistics of the United States Department of Agriculture, which has had the subject under investigation for several years. The money value of one acre of produce in 1911 averaged about \$15.48, as compared with \$15.50 in 1910, \$15.99 in 1909, and \$9.58 in 1899. An investigation of prices of about 85 articles generally purchased by farmers indicated that such articles averaged in price in 1911 about 1.1 per cent. higher than in 1910, 2.6 per cent. higher than in 1909, and about 15.3 per cent. higher than in 1899. Taking into consideration the variation in the price of things which farmers buy and sell, it appears that the purchasing power of one acre of crops in 1911 was 1.2 per cent. less than in 1910, 5.7 per cent. less than in 1909, and 41.6 per cent. greater than in 1899. On this basis 1909 stands as the most prosperous of recent years and apparently the most prosperous for farmers in the past fifty years for which there are records.

Increasing study is being given to the problems of distribution of farm products, and it is recognized that this subject must be given the same attention which agricultural production has received. Large crops mean as a rule low prices for the producers without a corresponding reduction in favor of the consumer, and each year sees an enormous waste of perishable food products at the farm because no practicable means have as yet been devised for placing them in the hands of the hungry thousands perhaps a few hundred miles away. The organizing of better and more economical means of shipping and of more direct dealing between the producer and the consumer has been unusually active the past year. Systems of auto-truck lines have been inaugurated in several sections of the central West, which make regular collections of farm produce for delivery to the local markets. The cost of transportation on small lots is much cheaper than the farmer could do it. This promises soon to be a regu-

lar feature of many communities. A recent study of the marketing of grain from the Pacific Coast region shows that it is carried 18,000 miles by sea to the English miller cheaper than by the 2000 mile haul across the mountains to milling centres in the Mississippi Valley. For instance, the total ocean freight rate and marine insurance on wheat from Sacramento to England is estimated at from 16½ cents to 22½ cents per bushel, and 39 cents to Chicago. The approximate cost of marketing wheat in England from country shipping points in the Pacific Northwest, including commission, warehouse, and freight charges, is estimated at from 18.6 cents to 40.5 cents per bushel, and of barley from 14.7 to 34 cents per bushel.

AGRICULTURAL CREDIT. There is a recognized need of better facilities for raising money to carry on farming operations in the United States, and provision of some form of agricultural credit has been one of the live questions of the year. A special investigation of conditions, made by the United States Department of Agriculture, developed the fact that a large proportion of the farm owners and tenants are able to give good security, but less than half of these can secure needed short-time loans and advances because of insufficient opportunity to borrow. Long-time loans are even more difficult to obtain. Sources of credit of any kind other than the country stores are often lacking. Interest on loans for purchasing farm property was found to range usually from 6 to 8 per cent., with commission of 2 to 5 per cent. The latter, with renewals after three to five years adds materially to the interest rate. All three political parties adopted a rural credit plank in their platforms. Through the ambassadors and ministers President Taft conducted an investigation of the subject of agricultural credit in Europe, and in October published a letter to the governors of the States, embodying a report on this subject and recommending that the matter be considered by the States; and a special conference of governors was held in Washington early in December.

In connection with the Southern Commercial Congress at Nashville in the spring, a conference on rural credit was held, at which strong arguments were made to show the need of correcting the financial weakness of the rural life in this country as compared with the industrial and commercial life, by building up rural credit on European experience. This congress arranged for the appointment of a select committee from the various States of the Union to go to Europe in the summer of 1913 for the purpose of studying coöperative credit systems there, with a view to formulating a system to meet the needs of American agriculture. Some of the Canadian provinces have planned to send delegates with this committee.

A concrete scheme for the formation of a system of land banks in the United Kingdom was presented before the British Association at the 1912 meeting. The system proposed was to be self-supporting and free from state control. It would be confined at first to assisting farmers in the purchase of their holdings, and later extended to the purchase of livestock, seeds, fertilizers, and the selling of farm produce.

In Uruguay, by an act passed in January, 1912, a section of rural credit, with an initial capital of \$500,000, was established in the Bank

of the Republic (the central bank of Uruguay), and the formation of local rural credit banks was authorized. This is one of the steps toward breaking up the large estates into smaller farms, and is intended to aid the small landholder and to encourage colonization schemes. Rural credit banks are being extended in Jamaica; and the provision of land banks is under consideration by the Parliament of South Africa, on the plan of the land bank in the Transvaal, which has proved a great success. See AGRICULTURAL CREDIT.

INCREASING AGRICULTURAL EFFICIENCY. An interesting development in extending expert assistance to the farmers is the provision of what are variously known as county agents, county administration men, agricultural commissioners, and farm bureaus. In these the county, or an even smaller area, is usually the unit. In some cases they are maintained by the county entirely, in others in part by the agricultural college, and in others through co-operation with the United States Department of Agriculture. In De Kalb County, Ill., for example, an organization was formed, a guaranty fund of \$10,000 raised, and a professor from the State university employed for a period of three years as agricultural commissioner, who will devote his whole time to aiding the farmers in developing and improving their methods, conferring with them, and conducting demonstrations. In a number of States funds have been provided to enable the agricultural colleges to furnish a limited number of such men and exercise supervision over them, the county sharing the expense. At the last session of Congress \$300,000 was appropriated for carrying on such work through the Department of Agriculture. There are now about 75 county agents in various parts of the country and others are being established as fast as means and competent men can be had. In every case the work in the State is conducted in co-operation with the agricultural college or experiment station.

This movement is in line with the object aimed at by the National Soil Fertility League, that is, to provide for better and more profitable systems of farming, which will conserve the soil fertility, and to improve the efficiency of production. During the past year it has been aided by donations from two large business concerns. Sears, Roebuck and Co., a Chicago mail-order house, has provided \$1,000,000 for experts to advise and demonstrate in each of 100 counties throughout the country. The International Harvester Company has set aside \$1,000,000 to be used in conducting a campaign of agricultural extension among farmers, under the direction of Prof. P. G. Holden, formerly of the Iowa State College. The resources of this large concern and its 40,000 dealers throughout the country will be directed toward the success of the enterprise. The Chicago board of trade has also announced a similar plan to devote \$1,000,000 to the improvement of agricultural practice through practical aid extended to farmers through county agents. The general education board, which has for several years financed agricultural demonstration in the South, has recently announced that it will extend this assistance to Northern States. Allotments have been made for work in New York and Maine.

The railroads and bankers' associations of

the country are also interesting themselves in the matter of greater efficiency in agricultural production. It is stated that about three-fourths of the mileage of railroads in the United States is operated by companies which are making organized efforts to promote the agricultural development of their territory. In addition to exploitation of the country which they serve, they are conducting demonstration farms, coöperative experiments, employing agricultural experts for the advice of the farmer, and publishing and distributing literature. The State and national bankers' associations have entered actively into this effort, as in the case of North Dakota, where a better-farming association was financed to the extent of \$45,000, \$5000 contributed for farmers' institutes, and \$5000 for holding local corn-growing contests.

A novel departure the past year was the issuing of farm proclamations by the governors of three States. The governor of Virginia designated August 14 as "Forage Day," and urged the farmers to meet in their county court-houses to discuss the growing of alfalfa and other forage crops. Specialists were in attendance at many of the meetings. Early in September the governors of Ohio and Minnesota issued special proclamations setting aside the week of September 16-21 as "Seed-Corn Week," and urging the farmers to select their corn for next year's planting, laying special emphasis on the necessity for early selection.

To induce immigrants coming from foreign rural communities to settle on the land, Mr. M. G. Kahn, of New York, has presented 13,000 acres of land in New Jersey for perpetual use, to be let rent-free in 10-acre lots to such immigrants.

The Boy Scouts' headquarters at London has initiated garden work for the members, and garden clubs have been formed. A farm colony for Boy Scouts has also been established in England by the gift of a farm of about 100 acres. Five acres are allotted to each group of eight boys, which they conduct with the advice of experts for their own profit. There are about fifty boys in residence, who engage in every branch of agriculture. The colony is expected to direct their attention to farming, and to be self-supporting when started.

The establishment of a coöperative farm for women is under consideration in England, the first proposed colony to be on a tract of 223 acres in Sussex. The purpose is to train young women who are desirous of emigrating to English over-sea possessions, and to furnish an opportunity to an increasing number of women who wish to engage in farming, but lack experience and facilities.

IMPORTANT EVENTS. The Scottish board of agriculture was recently created by the government. Prof. Brynner Jones, principal of the agricultural department of the University College of Wales, has been appointed as first commissioner of agriculture for Wales. He will advise the British board of agriculture on the agricultural work of the country and on the prospective grants from the Development fund to Wales.

The Republic of China has established a department of agriculture and forestry on modern lines. The new department has begun the publication of a quarterly agricultural journal (in Chinese), and a national meteorological service will be established.

R. N. Lyne, director of agriculture in Portuguese East Africa, has been appointed director of the new agricultural department of Ceylon.

The Italian government has instituted a consulting commission for agriculture, composed of sixteen members. The object of the commission is to study and suggest methods for intensifying agricultural production and protection from fraud in the commerce of agricultural products. It will take over the duties of the present Cenologic Commission in relation to the wine industry, and of the commissions for the poultry and oil industries.

A commission to examine the wheat supply of France was organized under an order issued in June by the minister of commerce and industry.

In Western Australia the state government has decided to undertake the manufacture of agricultural implements and machinery.

It is announced that Prince von Liechtenstein has established an institute for plant breeding at Eisgrub, in Moravia. Prof. Eric von Tschermak, professor of plant breeding at the agricultural high school at Vienna, will be director of the institute.

Prof. A. D. Hall, director of the Rothamsted Station since 1902, has resigned to devote his attention entirely to the work of the development commission, of which he has been agricultural representative since its inception.

Dr. J. C. Willis has resigned as director of the Royal Botanic Gardens, Peradeniya, Ceylon, to accept the directorship of the botanic gardens at Rio Janeiro.

Dr. William Trelease, director of the Missouri Botanical Gardens since 1889, has resigned, and has been succeeded by Dr. George T. Moore.

MEETINGS AND CONVENTIONS. The annual meeting of the Southern Commercial Congress, held at Nashville, Tenn., in the spring of 1912, was devoted to the presentation of facts showing the educational and agricultural recovery of the South during the past half century, and the discussion of measures for future advancement. It advocated a commission to standardize drainage laws, and favored a complete survey by the government of all swamp and overflowed lands and the preparation of plans for their drainage.

A National Drainage Congress was held at New Orleans in April, the first meeting after the organization of the new body. It advocated a plan for the drainage of the swamp lands of the country (largely held in private ownership) by the general government, on a partial reimbursement plan.

The National Irrigation Congress held its twenty-first meeting at Salt Lake City, Utah, at the end of September, celebrating the sixty-fifth anniversary of the beginning of American irrigation.

The International Dry Farming Congress was held at Lethbridge, Alberta, Canada, October 21 to 25.

An international congress for rice culture was held at Berecelli, Italy, in October, with an exposition of irrigation and rice culture. It was expected that the exposition would be the most important one of its kind ever held in Europe.

An international congress of electroculture was held at Rheims, France, in October. Among

other topics on the programme were the influence of atmospheric and dynamic electricity on the nitrification of the soil, on fertilizers, on the germination of seeds, growth of plants, action on injurious insects and fungi, protection from hail, etc.

An international association of poultry instructors and investigators has been formed, which held its first conference in London during July, twenty-seven countries being represented. A central bureau of information is to be maintained, which will be located in London for the present.

The extent to which agricultural problems are commanding the attention of various branches of science was well illustrated at the meeting of the American Association for the Advancement of Science at Washington in the closing days of 1911. Likewise at the 1912 meeting of the British Association for the Advancement of Science, held at Dundee, in September, agriculture formed the subject of a full section for the first time. Agriculture was also well represented at the Eighth International Congress of Applied Chemistry, in New York, there being a long list of papers relating to investigation in agricultural chemistry, animal nutrition, soils, fertilizers, factors influencing plant growth, dairying, etc.

The Tenth International Congress of Agriculture will be held at Ghent, June 8-13, 1913, in connection with the International Exposition. The Third International Congress of the Association of Agricultural Women will be held at the same place immediately following the Congress of Agriculture.

LITERATURE. The following are among the recent books which have appeared: L. L. Van Slyke, *Fertilizers and Crops, or the Science and Practice of Plant Feeding* (New York, 1912); E. T. Russell, *Soil Conditions and Plant Growth* (New York, Bombay, and Calcutta, 1912); Eugene Grubb and W. S. Guilford, *The Potato* (New York, 1912); C. G. Elliott, *Engineering for Land Drainage* (New York, 1912); *Abridged Agricultural Records* (a compilation of the findings of the U. S. Department of Agriculture and the agricultural experiment stations) (Washington, 1912); *Agricultural Opportunities in Various Sections of the Country* (U. S. Department of Commerce and Labor, 1912); George Walker Fiske, *The Challenge of the Country. A Study of Country Life Opportunities* (New York, 1912); C. E. Marshall, *Microbiology for Agricultural and Domestic Science Students* (London, 1912); Wilfrid Sadler, *Bacteria as Friends and Foes of the Dairy Farmer* (London, 1912); H. Sangier, *Agricultural Credit in France* (Paris, 1911); *Systems of Rural Coöperative Credit* (U. S. Senate, 1912); *Agricultural Credit* (U. S. Senate, 1912); T. N. Carver, *Principles of Rural Economics* (Boston and London, 1911); J. L. Coulter, *Coöperation Among Farmers* (New York, 1911); I. B. Green, *Law for the American Farmer* (New York, 1911).

ALABAMA. **POPULATION.** According to the Census Bureau statistics issued in 1912, out of a total population of 2,138,093 in 1910, the foreign born whites numbered 18,956, compared with 14,338 in 1900. The largest pro-

portion of these, 3599, came from Germany; from Italy, 2695; from England, 2348. In the city of Birmingham, with a total population of 132,685, the foreign-born population numbered 5700. Of these, 1360 came from Italy. There were in 1910, 908,202 negroes in the State, with 151,410 mulattoes. The negroes in 1890 numbered 678,489 and the mulattoes, 77,420.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911-12 are shown in the following table:

	Acreage	Prod. Bu.	Value
Corn.....1912	3,150,000	54,180,000	\$42,120,000
1911	3,000,000	54,000,000	42,120,000
Wheat.....1912	30,000	318,000	359,000
1911	30,000	345,000	414,000
Oats.....1912	260,000	5,200,000	3,224,000
1911	283,000	5,434,000	3,586,900
Rye.....1912	1,000	12,000	16,000
1911	1,000	10,000	12,000
Rice.....1912	300	9,000	8,000
1911	300	6,000	4,000
Potatoes.....1912	15,000	1,215,000	1,094,000
1911	15,000	1,170,000	1,381,000
Hay.....1912	209,000 a	261,000	3,811,000
1911	209,000	293,000	3,750,000
Tobacco.....1912	300 b	225,000	79,000
1911	200	140,000	35,000
Cotton.....1912
1911 c	1,600,000

a Tons. b Pounds. c Bales.

The agricultural statistics of the Thirteenth Census, dated April 15, 1910, were published in 1912. According to these figures the number of all farms in the State in 1910 was 262,901, compared with 223,220 in 1900. The land in farms was 20,732,312 acres, approximately the same as in 1900. The improved land in farms was 9,693,581 acres, a gain of about 1,000,000 acres in the decade. The average number of acres per farm was 78.9, compared with 92.7 in 1900. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$370,138,429, compared with \$179,399,882 in 1900. The average value of all property per farm was \$1408 and the average value of land per acre was \$10.46. The farms operated by owners and managers numbered 104,575 and those operated by tenants, 158,326. Of the farms operated by owners and managers, 74,504 were free from mortgage, while 27,457 were mortgaged. The native white farmers numbered 151,214; the foreign-born whites, 1244, and the negroes and other non whites, 110,443. The total value of the domestic animals, poultry, and bees in 1910 was \$65,594,834, compared with \$36,105,799, in 1900. The cattle numbered 932,428 valued at \$13,469,626; horses and colts, 135,636, valued at \$13,651,284; mules, 247,146, valued at \$31,577,217; swine, 1,266,733, valued at \$4,356,520; sheep and lambs, 142,930, valued at \$299,919. Poultry of all kinds numbered 5,028,104, valued at \$1,807,239.

MINERAL PRODUCTION. Alabama ranks third among the States in the production of iron ore. There were mined in the State in 1911 3,955,582 long tons, compared with 4,801,275 long tons in 1910. The value in 1911 was \$4,876,106, compared with a value in 1910 of \$6,083,722. The greater part of the iron produced in the State is hematite.

The production of coal in the State in 1911 was 15,018,965 short tons, with a value of \$19,077,489. This was a decrease of 1,092,497 short tons from the production of 1910. The coal

mines of the State were practically free from labor troubles in 1911.

MANUFACTURES. The Census of 1910 included statistics of manufactures in the State. The most important results are given in the table below: Lumber and timber products were the greatest in value and in the number of wage-earners employed. The value of the lumber and timber product was \$26,058,000, and the wage-earners employed in the industry numbered 22,409. In the manufacturing connected with cotton goods the value of the product was \$22,212,000 and the wage-earners numbered 12,731. In the iron and steel industry the product was valued at \$21,236,000, and the men employed numbered 3783. Other industries employing over 1000 wage-earners were coke, oil, cottonseed and cake, fertilizers, printing and publishing, and brick and tile. The total number of wage-earners engaged in the industries of the State in 1909 was 72,148. Of these 65,686 were male and 6462 female. There were 3653 persons under 16 years of age employed. Of these 1380 were females. The prevailing hours of labor were from 60 to 72 a week. Of the total, 44.5 per cent. worked 60 hours a week, 25.7 per cent. more than 60 and less than 72, and 10.3 per cent., 54 hours a week. The chief manufacturing city in the State was Birmingham, where 8999 wage-earners were employed and the value of the product was \$24,122,214. Other important manufacturing centres were Bessemer, Montgomery, Mobile, and Anniston.

	Number or Amount		
	1909	1904	1899
Number of establishments	3,398	1,882	2,000
Persons engaged in manufactures	81,972	67,884	(1)
Proprietors and firm members	3,769	1,948	(1)
Salaried employees	6,055	3,763	2,259
Wage earners (average number)	72,148	62,173	52,711
Primary horsepower	357,837	293,185	173,208
Capital	\$173,180,000	\$105,383,000	\$60,166,000
Expenses	129,153,000	94,262,000	59,097,000
Services	33,849,000	25,745,000	16,971,000
Salaries	6,565,000	3,867,000	2,059,000
Wages	27,284,000	21,878,000	37,998,000
Materials	83,443,000	60,458,000	37,998,000
Miscellaneous	11,861,000	8,049,000	4,128,000
Value of products	145,962,000	109,170,000	72,110,000
Value added by manufacture (value of products less cost of materials)	62,519,000	48,712,000	34,112,000

1 Figures not available.

EDUCATION. The enumeration taken in July, 1912, showed the number of persons of school age in the State as 727,297, of whom 399,273 were white and 328,024 colored. The total enrollment in all the schools of the State was 298,648 white and 146,457 colored. The enrollment shows a slight decrease from 1911, both in white and colored pupils. The number of teachers employed in 1912 was as follows: White male teachers, 2886; female, 5086; colored male teachers, 937; colored female teachers, 906. The average yearly salary of male

white teachers was \$410; of female white teachers, \$334; of colored male teachers, \$175; colored female teachers, \$155. The total disbursement for educational purposes in 1912 was \$3,703,711. Efforts were made during the year to improve the elementary schools of the State by a closer supervision, by the grading of schools, and by the vitalizing of school work. Considerable progress was made.

CHARITIES AND CORRECTIONS. The institutions under the control of the State include the Alabama Hospital for the Insane at Tuscaloosa, the Alabama Boys' Industrial School at Birmingham, the Alabama Mercy Home at Birmingham, and the State Prison at Montgomery. There is no board or commission directly in charge of the charitable and correctional institutions of the State.

POLITICS AND GOVERNMENT. There was no meeting of the legislature in 1912, as its sessions are quadrennial. The last was held in 1911 and the next regular session will begin January 10, 1915. However, the condition of the State's finances during 1912 indicated that it would be necessary to call the legislature in extraordinary session during 1913. The chief matter for consideration will be an adjustment of the revenue laws. The term of Governor O'Neal does not expire until 1915, so there was no election for governor in 1912. The State Democratic primary was held on April 1 and Charles Henderson was nominated for president of the State railroad commission; John H. Wallace, game and fish commissioner, and John W. Abercrombie, Congressman-at-large. The State Democratic convention of April 17 renominated Justices Sayre and McClellan for the supreme court. All of these nominees were subsequently elected in November.

An important constitutional amendment was adopted in the November election, which provided that the legislature may put officers of Jefferson County on salaries instead of fees as at present. This is expected to effect a very large annual saving to the people of the largest county in the State.

The fact that Mr. Oscar W. Underwood, Democratic leader of the House of Representatives from Alabama, was one of the leading candidates for the Democratic presidential nomination, gave unusual interest to political happenings in the State. The Democratic delegates were naturally pledged to Mr. Underwood and voted for him throughout the Democratic convention until his name was withdrawn. A dispute as to the Republican delegates in the Ninth District of the State was one of the most discussed contests decided by the National Republican committee. This contest is described fully in the article **PRESIDENTIAL CAMPAIGN**. The delegates were finally given to President Taft, and the Republican delegates in the other districts were given to the President practically without dispute. The Republican convention was held on March 7. The Progressive Republicans refused to accept the delegates chosen at this convention, and on May 11 held a State convention with 300 delegates present. At this convention a platform was adopted and Mr. Roosevelt was endorsed for the presidency. Twelve delegates to the national convention were elected, each with half a vote. It was decided to hold State primaries in which State officers would be nominated after the national convention. The Democratic State convention met on April 17, and the delegates, as noted

above, were instructed for Mr. Underwood for President. The result of the presidential vote in the State in the election of November 9 was as follows: Wilson, 82,439; Roosevelt, 22,689; Taft, 9731.

INDUSTRIAL PROGRESS. The most important industrial event of the year was the coming of the Alabama Interstate Power Company, backed by English capital, which will develop the water power of Alabama on an enormous scale. The entire project will cost about \$50,000,000. Work was well under way during 1912 on the initial plant at Lock 12 on the Coosa River, which will cost about \$3,500,000. Electric power from this plant will be carried to Birmingham and Montgomery.

STATE GOVERNMENT. Governor, Emmett O'Neal; lieutenant-governor, W. D. Seed; secretary of State, Cyrus B. Brown; auditor, C. B. Smith; adjutant-general, J. B. Scully; attorney-general, R. C. Brickell; treasurer, John Purifoy; superintendent of education, H. J. Willingham; commissioner of agriculture, R. F. Kolb; ex-officio commissioner of insurance, Cyrus B. Brown—all Democrats.

JUDICIARY. Supreme Court—Chief justice, J. R. Dowdell; associate justices, Ormond Somerville, A. D. Sayre, J. C. Anderson, Edward de Graffinried, J. J. Mayfield, and Thomas McClellan; clerk, R. F. Ligon, jr.—all Democrats.

STATE LEGISLATURE, 1913. Senate, Democrats, 44; Republicans, 10; House, Democrats, 95; Republicans, 4; joint ballot, Democrats, 135; Republicans, 14. Democratic majority, Senate, 30; House, 91; joint ballot, 121.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ALABAMA, UNIVERSITY OF. A State university of higher learning at Tuscaloosa, Ala., founded in 1831. The total number of students enrolled in the various departments of the university in the year 1911-12 was 1175, which includes 550 enrolled in the summer school. The members of the faculty numbered 100. The faculty of the summer school numbered 30. The institution is supported largely by the State, and had no notable benefactions during the year. The volumes in the library numbered 40,000. President, George H. Denney, LL. D.

ALASKA, POPULATION. While there was a small increase in the number of residents in Alaska who were engaged in industries of a permanent character in 1912, there was apparently a considerable decrease in the population of the Territory as a whole. The total population in 1910 was 64,356, including natives. The native population has remained comparatively stationary in the two years since 1910. A moderate decline in the white population in the last two years is due, in part, to diminished activity in placer mining in the interior valleys, and, to some extent, to the withdrawal of much of the public lands and natural resources from development. The Territory includes sixteen towns, one of which was added during 1912.

MINERAL PRODUCTION. The most notable event in the mining industry in the Territory during 1912 was an increase in the output of copper ore in the Chitina and Prince William Sound regions. Preparations were also made for a very large gold quartz development in the Juneau district. The entire mineral production in 1911 was valued at \$20,650,000. The gold production in 1911 was \$16,853,256, compared with \$16,126,749 in 1910. The out-

put from siliceous ores was \$4,226,687, compared with \$4,105,459 in 1910. The production from placer mines was valued at \$12,540,000 in 1911. About three-fourths of the gold production comes from the placer mines, but the tendency in Alaska is for the relative output from the deep mines to increase. The Fairbanks Camp in the Yukon Basin continued to lead all other placer gold districts in the Territory in production, but the output decreased from \$6,100,000 in 1910 to \$4,500,000 in 1911. The production of the Innoko-Iditarod regions of the Yukon Basin increased from \$825,000 in 1910 to approximately \$3,000,000 in 1911. The Seward Peninsula production was about \$3,100,000 as against \$3,530,000 in 1910.

The production of silver in Alaska in 1911 was 460,231 fine ounces, compared with 157,850 fine ounces in 1910. Of the total production, 320,114 fine ounces were obtained from copper ores, 110,288 from placer gold, and the small remainder from siliceous ores of the lode gold mines.

The copper production in 1911 showed a remarkable increase. The output in that year was 22,314,889 pounds, compared with 4,311,026 pounds in 1910. The large increase in 1911 was due to the entrance of the Copper River district into the producing list. The total mine production for 1911 was 27,267,878 pounds. A considerable portion of this had not been smelted at the close of the year. The copper produced from the Copper River district came entirely from one mine, the Bonanza. Other properties are being developed and in some cases encouraging results are reported. There was practically no output of coal in Alaska in 1911. The greater part of the coal used in the Territory was imported. The importations amounted to 71,452 tons. No practical steps were undertaken during the year for the opening of the coal fields.

The necessity for adequate coal reserves on the Pacific Coast, and especially in Alaska, for the needs of the navy department resulted in an appropriation of \$75,000 from Congress for mining and testing Alaska coal. This work was undertaken by the Department of the Interior through the agency of the Bureau of Mines. It was hoped that some investigation of the Matanuska coal fields would be possible, but the season had so far advanced when the appropriation became available that work was necessarily confined to the Bering field where a coal mine was opened and coal for experimental use by the navy under practical working conditions was mined and transported to tidewater. The Alaska coal leasing bill, which was favorably reported by the Senate committee on public lands in the second session of the Sixty-second Congress, proposes to give to all of the entrymen interested in still pending entries and who are not involved in pending criminal proceedings, or have not been found guilty of criminal acts in connection with their claims, a preference right to lease the lands in which they are respectively interested. During 1912 considerable progress was made in the disposition of these claims. The criminal cases resulting from alleged coal frauds in Alaska were expedited during the year and set for trial so that the innocence or guilt of the defendants may be promptly and definitely determined.

An end was made to the controversy over what has been known for years as the Cunningham coal claims of Alaska by the action in

September of Secretary Fisher in finally canceling them. In rendering his decision on this question, which had come to him through appeal, he said that "the findings of fact and the conclusions both of law and fact of the commissioner as expressed in his opinion of these cases are correct." After the decision was announced the registrar and receiver of the Land Office at Juneau, Alaska, by order of the acting commissioner of the General Office, placed on record the cancellation for fraud in the Cunningham claims. But money which had already been paid to the United States is forfeited and can be restored only by act of Congress.

AGRICULTURE. Successful work was carried on during 1912 at the Experiment stations in the Territory. As the result of an unusually long summer in 1911, vegetables, particularly potatoes, matured well, except at interior points. Grain breeding at the Rampart station promises success and tests were made during the year of the several hybrid varieties of barley already developed. At the Sitka station the hybrids obtained by the crossing of several cultivated varieties of strawberry with the wild strawberry of the Alaska coast were more successful than before. Work at the Kodiak station in the breeding of cattle and sheep met with signal success during the year, but the grazing in the part of Kodiak Island where the station is situated was damaged by a heavy fall of volcanic ashes in the summer of 1912. See **AGRICULTURAL EXPERIMENT STATIONS.**

COMMERCE. The merchandise shipments, including precious metals and copper, increased materially during 1912. The total commerce between Alaska and the United States and between the Territory and foreign countries aggregated \$62,680,507 for the fiscal year 1912. Merchandise shipments from Alaska to the United States aggregated in value \$18,809,270, as against \$15,736,510 in 1911. There was a large increase in the shipment of material required in the canning of fish, an industry which has greatly expanded in recent years. Dredging machinery to a considerable value was also shipped into the Territory. The total shipments, including copper and precious metals, from Alaska to the United States, were valued at \$20,776,756, being an increase of nearly \$7,000,000 over 1911. Of the large increase more than \$4,000,000 was in copper ore and nearly \$3,000,000 in canned salmon.

FISHERIES. According to a review made in 1912, there were 17,932 persons engaged in all branches of the fisheries of Alaska during the calendar year 1911. The total investment in all branches of the fisheries in that year, exclusive of that in the vessel fisheries for off-shore cod and halibut was \$22,617,387. Of this amount, \$19,931,215 was invested in the salmon canning business and \$623,126 in salting and mild-curing salmon. Other large investments were in the halibut fishery, in the herring fishery, and in the cod fishery. At the end of 1912 there were five private and two government hatcheries in operation.

EDUCATION. The number of public schools for natives of Alaska maintained during 1912 was 86, with an enrollment of 4018 and an average daily attendance of 1805. The field force of the Alaska school service consists of five superintendents, 110 teachers, 7 physicians, 7 nurses, 2 contract physicians, and 2 hospital

attendants. Of the appropriation for education, \$24,926 was expended for the medical relief of natives. Adequate provision for the medical relief of natives of Alaska is an urgent duty, and the Secretary of the Interior in his annual report asks for liberal appropriations therefor.

TRANSPORTATION. The importance of wagon roads and trails to the development of the Territory is manifest. Valuable work was carried on during the year by the board of road commissioners, although the season was an unfavorable one for road work in most parts of the Territory on account of heavy and incessant rains in the late summer and fall. An act creating a legislative assembly in the Territory of Alaska, passed during the last session of Congress, provided for the creation of a railroad commission to conduct an examination into the transportation question in Alaska and to report its conclusions to Congress at the beginning of the second session of the Sixty-second Congress. There was practically no building of railroads during the year. Traffic on the Copper River Railroad was suspended for several weeks as the result of washouts.

The Secretary of the Interior in his annual report of 1911 recommended to Congress as necessary for the immediate relief of Alaska the construction by the federal government of a central trunk-line railroad from tidewater through the Matanuska coal fields to the Tanana or Yukon rivers; more liberal appropriations for aids to navigation such as lights and buoys; more liberal appropriations for the construction of roads and trails; and the adoption of a form of territorial government better adapted to the remote situation and the peculiar local conditions of the Territory. The last of these recommendations is the only one upon which action was taken by Congress. A territorial legislature with limited jurisdiction was created. A government railroad was not authorized, but a provision was inserted in the territorial government bill authorizing the appointment of a commission consisting of an army engineer, a navy engineer, a representative of the Geological Survey, and a civil engineer who had had practical experience in the construction and operation of railroads. This commission was appointed and proceeded to Alaska, where it engaged in a personal examination of the Territory with a view to making a comprehensive report to Congress.

On February 2 the President sent to Congress a message largely devoted to the government and development of Alaska. He urged the construction of a government railroad and the establishment of a commission form of government. One-half of this commission should be elected and the other half appointed by the President. He proposed a leasing system for government coal and phosphate lands in Alaska.

LEGISLATION. A measure was introduced into Congress to provide a form of self-government for Alaska. This bill created a legislature for the Territory to be composed of two houses, elected from the four judicial districts of the Territory. Each district is represented in the legislature by two senators and four representatives. The senators are to hold office for four years and are chosen alternately every two years. The members of the lower house hold office for two years only. The legislature, under this measure, would consist of a senate of eight and a lower house of sixteen members.

This body was given no right to dispose of any of the public domain and was not empowered to legislate upon certain measures, which were reserved for Congress. On almost all ordinary matters, however, the right was given to this legislature to act. Its enactments were made subject to veto by the governor of the Territory, who could be overruled by a two-thirds' vote of the legislature. The acts of the legislature were to be transmitted at every session to the President, who was to submit them to Congress, which has the right to nullify any of these acts. Until they are thus nullified, however, they have the force of laws. This measure was presented to take the place of the bill introduced in 1910, which provided practically for a commission form of government with a commission appointed by the President. This measure failed to pass Congress.

ALBERTA. A province of the Dominion of Canada (since September 1, 1905). Capital, Edmonton (population, 1911 census, 24,900; estimated in 1912 at over 53,000). Area, 255,285 square miles; population (1911 census), 374,663. Lieutenant-governor (in 1912 and since September 1, 1905), George Hedley Vicars Bulyea. There are an executive council (responsible ministry of four members) and a legislative assembly (41 members elected for five years). Premier in 1912, Arthur L. Sifton. See CANADA.

ALBERT, CHARLES STANLEY. An American clergyman and editor, died January 28, 1912. He was born in Hanover, Pa., in 1837 and graduated from Hanover College in 1867. He studied theology at the Mt. Airy Theological Seminary, graduating in 1870. In the same year he was ordained to the Lutheran ministry. He filled pastorates in several cities until 1894, when he became editor of the *Augsburg Teacher*. He filled many positions in the Lutheran Church and was editor of many of its publications. He was also author of a number of booklets.

ALCOHOL. A systematic investigation, instituted by the Bavarian government, into the relation between alcoholism and criminality, brought to light some interesting data. In 1910, 8864 convictions were obtained against persons violating the law, whose derelictions were directly referable to intoxication or to chronic alcoholism. One hundred and ninety of these individuals were chronic alcoholics, and 14 per cent. of all those convicted were under the influence of drink when committing the offenses charged against them. Over half these offenses were crimes against the person—the infliction of dangerous bodily injuries seeming to be a special predilection of drinkers. Every third offense of this character could be referred to alcoholism. Only a small proportion of crimes against property were committed under the influence of drink. The vital connection between insanity and alcohol is illustrated anew by statistics from Kansas, a Prohibition State. Whereas in almost every part of the world the increasing ratio of mental disease is causing alarm, in Kansas the proportion of insanity is apparently steadily declining. In 1904 commitments to the asylums for the insane amounted to 56.2 per hundred thousand of the population. In 1910 the number had fallen to 42.3 and in 1911 to 38.3 per 100,000. The members of the State board of control and the asylum officials credit this satisfactory condition of affairs to the stricter enforcement of the prohibition laws.

and the consequent diminution in the quantity of alcohol consumed. They pointed out that alienists attribute at least 10 per cent. of all cases of insanity to alcohol, directly, and indirectly the drug is an important factor in the causation of a much higher percentage of cases, so that the Kansas statistics agree fairly well with those of the alienist statistician. See INSANITY.

The life insurance companies of England make a careful study of the relation of alcohol to longevity. For example, the report of the Sceptre Life Association contains an instructive comparison between the mortality of its abstaining and non-abstaining policyholders. In 1911, in the general section, the mortality was 77.78 per cent. of the expected; that is, there were 105 out of 135 expected deaths. In the temperance section the mortality was only 51.11 per cent. of the expected deaths, or sixty-nine out of 135. For the last twenty-eight years the percentage of actual to expected deaths has been in the general section, 79.7; in the temperance section, 52.45. Both classes of policyholders are of the same social status, engaged in the same occupations, and have passed the same medical examination. The conclusion is therefore drawn that total abstinence tends to longevity. However, no account is taken of the fact that total abstainers are apt to be more careful in all their ways of life than the average citizen. They are more thrifty, pay more attention to hygiene, etc., and these factors must play some part in their longevity.

Late in 1912 Col. L. Mervin Maus, U. S. A., chief surgeon of the Eastern Division of the army, published an article upon the use of alcohol among officers and officials of the military, naval, and civil services of the United States. He classes alcohol with the narcotics as equally dangerous, and states that, taken in "moderation," it lowers the general intelligence, perception, judgment, caution, and power of rapid action, lowers also one's moral standards and lessens self-restraint, while it produces unreliability, untruthfulness, dishonesty, and crime. He cites Lord Kitchener as forbidding his men to use spirits in the Sudan campaign, also Lord Roberts as opposed to its use, and points to the Boers, who, totally abstaining from spirits and beer, showed remarkable efficiency. He quotes Sir Frederick Treves as saying at Ladysmith, "The drinking men fell out and dropped as regularly as if they were labeled with the big letter D on their backs." Colonel Maus urges that total abstinence be a requirement in the election of all civil officers, and for all appointments to important positions or to the positions of heads of bureaus in any department of government and in any place of importance and responsibility.

WOOD ALCOHOL. During the Christmas holidays of 1911 161 inmates of the Berlin municipal lodging house were taken violently ill and 71 of them died. An investigation showed that wood alcohol, sold in neighboring saloons for ordinary whisky, was the cause. The incident gave rise to widespread discussion and to new attempts to add to our rather small stock of knowledge as to the underlying cause of its extreme toxicity, under certain circumstances, and to its behavior in the animal metabolism. Investigations at the Institute for the Fermentation Industries at Berlin, demonstrated that methyl alcohol is slowly digested by animals and more slowly eliminated, so that repeated

small doses are apt to accumulate in the system and produce severe toxic symptoms. These facts have not heretofore been duly appreciated. Considerable difference of opinion also exists as to whether the toxic action of wood alcohol is due to the alcohol itself or to some of the contaminating substances almost invariably present in it; as fusel oil, acetone, etc. To guard against the possibility of such fatalities as those referred to above, the Austrian board of health issued an ordinance more strictly limiting the use of wood alcohol in the industrial arts, and prohibiting absolutely its employment in the preparation of all articles of food.

The New York health board, at its meeting on January 23, adopted a new section of the sanitary code, which prohibits the sale or use of wood alcohol in any food or drink or in any preparation or mixture intended for external use by man, such as hair tonics, face lotions, etc. See LIQUORS.

ALEUTIANS. See ANTHROPOLOGY.

ALFALFA. The alfalfa crop of 1912 was affected by climatic conditions in the same manner as the hay crop in general. The season in most countries favored a good growth, but was unfavorable to the production of good hay on account of rainy weather at hay-making time and while the quantity of hay secured was satisfactory, the quality left much to be desired. The rainy weather with which most European countries had to contend was especially detrimental to the making of alfalfa hay, as the crop is not so readily cured as the grasses. In the United States and Argentina, the two principal alfalfa-growing countries of the world, the season was much more favorable to hay production than in Europe. Statistics on alfalfa are not regularly published for all countries and the world's production is not generally estimated. Certain data given at random indicate in a general way the importance of the crop in different countries and regions. In many countries, especially the United States and Argentina, the acreage is on the increase. Argentina has about 15,000,000 acres in alfalfa, but only about 10 per cent. of the area is cut for hay, the rest being used for grazing purposes. France grows about 2¼ million acres and produces from 5 to 6 million tons of hay. The acreage of Germany in 1912 was reported as 608,000 acres and that of the United Kingdom as 56,374 acres. In Hungary about 30,000 acres are grown for seed production, while the area devoted to hay production amounts to over 500,000 acres.

No data covering acreage and production in the United States other than the Census figures given in the YEAR BOOK for 1911 are available. The crop is growing in favor and importance wherever its culture is profitable. In many of the States east of the Mississippi River, in which alfalfa culture is comparatively recent, the crop is grown not only as an important source of forage and hay for consumption on the farm, but it is also produced for the hay markets of the larger eastern cities, where its value is being more and more appreciated.

In experiments conducted in New Zealand during the past year alfalfa was successfully

used as a soil binder in the reclamation of sandy lands.

ALGER, PHILIP ROUNSEVILLE. An American naval officer and mathematician, died February 23, 1912. He was born in Boston in 1859 and graduated from the United States Naval Academy in 1880. He served on the China and Mediterranean stations, and from 1888 to 1891 was on duty at the Navy Department in Washington. From 1891 to 1899 he was professor of mathematics and from 1899 to 1907 was head of the department of mechanics at the United States Naval Academy. This chair was abolished in 1907. He was a member of the Special Naval Board of Ordnance and was secretary and treasurer of the United States Naval Institute. From 1903 to the time of his death he was the editor of the *Proceedings* of the Institute. He was the author of *Exterior Ballistics* (1904); *Elastic Strength of Guns* (1906), and *Hydromechanics* (1902). He also contributed numerous articles on naval ordnance to technical magazines.

ALGERIA. A north African country, called a colony but actually an integral part of the French Republic. Algiers is the capital.

AREA AND POPULATION. Area by departments, European and native population (1911 census), and total density per square kilometer, are shown below.

The principal towns are: Algiers, with (1911) 172,397 inhabitants; Oran, 123,086; Constantine, 65,173; Bone, 42,039; Tlemcen, 39,874; Blidah, 35,461; Sidi bel Abbes, 30,942.

Department	Sq.kms.	Europeans	Natives	D.
Algiers	54,540	271,767	1,421,819	31
Constantine	87,302	155,654	1,945,443	24
Oran	65,897	319,089	892,212	19
Algeria proper	207,739	746,510	4,259,474	24
Southern Territories	367,550	5,533	481,052	1
Total	575,289*	752,043	4,740,526	10

* 222,119 square miles.

PRODUCTION. The country is largely agricultural. In the table below will be found the areas devoted to principal crops and the yield in 1911 and 1912, with the average yield per hectare (1912):

	Hectares		Quintals		Qs. per ha.
	1911	1912	1911	1912	
Wheat	1,337,411	1,462,714	9,959,934	7,395,012	5.1
Barley	1,360,500	1,388,212	40,399,613	7,160,292	5.2
Oats	181,411	192,460	1,755,092	1,792,713	9.3
Corn	8,941	12,412	85,573	94,964	7.7
Rye	636	154	851	1,036	6.7
Vines*	150,486	148,548	8,443,368	56.1
Tobacco	8,547	10,137	88,120	10.3
Cotton	900

* Yield in hectoliters.

Fruits, olive oil, timber, cork, and livestock are also produced for export. Silk culture is practiced. The mines yield iron, zinc, lead, silver, copper, mercury, coal, and petroleum. The phosphate industry is progressing. The fisheries products are of appreciable value. Livestock (1911): 226,764 horses, 192,484 mules, 279,315 donkeys, 1,113,952 cattle, 8,528,610 sheep, 3,861,847 goats, 110,012 swine.

COMMERCE AND COMMUNICATIONS. The table below shows the imports for consumption and

exports of domestic produce in thousands of francs:

	1907	1908	1909	1910
Imports	448,200	449,300	462,000	512,000
Exports	338,500	319,200	359,200	513,300

Principal articles of export in 1911, values in thousands of francs:

Wine	207,698	Cork	9,784
Cereals	80,492	Vegetables	9,718
Animals	34,193	Wool	8,184
Fruits	15,902	Skins	7,537
Iron ore	12,000	Esparto	7,186
Phosphates	10,977	Flour	6,031
Tobacco	10,947	Fibre	4,677
Zinc	9,925	Olive oil	4,489

Principal countries of origin and destination, 1910 trade, values in thousands of francs:

	Imps.	Exps.		Imps.	Exps.
France	437,896	410,387	Germany	4,401	10,593
Belgium	1,091	10,375	Russia	1,116	3,438
Neth'ds	1,729	7,772	Fr. Cols.	4,633	21,211
G. Brit.	13,885	19,610	Morocco	14,407	8,421
Spain	6,179	4,627	U. S.	3,569	2,748
Italy	2,855	7,644	Brazil	9,109	1
Aus.-Hy.	2,805	3,705	Others	8,247	2,752
Total	511,967	513,267			

Vessels entered (1910 trade), 5003, of 5,691,063 tons. Merchant marine (January 1, 1911), 980 vessels, of 31,771 tons (steamers, 105, of 21,246 tons). Railways in operation December 31, 1911, 3297 kilometers of main and 150 kilometers of local lines; telegraph lines 15,109 kms., wires 39,652.

FINANCE. The budget for 1912, as voted December 29, 1911, appears below:

Revenue	1000 fr.	Expenditures	1000 fr.
Direct taxes.....	13,928	Debts	23,473
Domains	8,271	Administration...	2,106
Indirect taxes...	44,133	Interior	26,158
Monopolies, etc..	9,691	Native adm.	5,794
Various	2,715	Finance	9,639
Receipts d'ordre.	28,569	Posts and tels...	12,162
Extraordinary ..	37,859	Public works....	19,113
Total	145,167	Agriculture, etc..	8,583
		Other	273
		Extraordinary ..	37,859
		Total	145,156

* Administration.

Southern Territories: 6,523,301 francs revenue, 6,513,284 francs expenditure (budget 1912).

Algeria is administered by a governor-general—in 1912, M. Lutaud.

ALIENS. See IMMIGRATION.

ALLITSEN, FRANCES. An English composer, died October 2, 1912. She was born in London, where she studied at the Guildhall School of Music. She made her debut in concert singing in Grosvenor Hall, London, in July, 1872. Among her more important works are *Sonata for the Piano* (1881); *Overture Slavonique* (1884); *A Dramatic Scene*, and *Cleopatra*. She also wrote over a hundred songs and duets.

ALMA-TADEMA, SIR LAURENCE. An English artist, died June 25, 1912. He was born in 1836 in the village of Dronryp, near Leeuwarden, Netherlands. His father, Pieter Tadema, a notary, died when the artist was four

years old. It was intended that the son should be a notary as his father had been, but his artistic talent was so apparent that before he was sixteen years old he was sent to Antwerp, where he became a student under Gustav Wappers. He entered the academy at Antwerp in 1862. In the same year he painted a portrait of himself which attracted much attention. In 1860 another picture, "The Bargain," was favorably received. From the Academy of Wappers he went to the atelier of Henri Leys, and in 1859 he assisted Leys in painting the frescoes in the Hotel de Ville at Antwerp.

Alma-Tadema's first great success was his picture "The Education of Clovis," painted in 1861 and exhibited in Antwerp the same year. This was the first of the famous series of Merovingian pictures, of which the most widely known was the "Fredegonda" in 1878. In 1862 he received his first gold medal at Amsterdam. In the following year he married a French woman, Marie Pauline Girard, and lived at Brussels until 1869, when she died. In the same year he exhibited two pictures at the Royal Academy and in the following year three more, including "Un Jongleur." He removed to London in 1870 and from that year until the time of his death made his home in that city. He had already achieved international fame, and in addition to the honors received in Holland and Belgium, had received medals of the Paris Salon of 1864 and the Exposition Universelle of 1867. In the year following his removal to London he married Laura Epp. From his arrival in England, Alma-Tadema's career was marked with unbroken success. In 1879 he became a member of the Royal Academy and in 1899, on Queen Victoria's birthday, he was knighted. His most famous pictures were those which portrayed scenes in ancient history, especially the history of Greece and Rome. He made a profound study of archaeology, and his pictures, aside from their artistic value, are remarkably faithful in depicting customs and architecture of the times to which they relate. Among his best-known pictures are "Clothilde at the Tomb of Her Grandchildren"; "How the Egyptians Amused Themselves 3000 Years Ago"; "Tarquinius Superbus"; "The Vintage"; "A Roman Emperor"; "The Conversion of Paula"; "The Finding of Moses," and "Caracalla and Geta." His work is peculiarly successful in defining the texture of marble and bronze. His drawing is good, his coloring faithful, but he has been charged with a merely intellectual appeal and a lack of any deep feeling.

ALUMINUM. The consumption of aluminum in the United States in 1911, according to the United States Geological Survey, was 46,125,000 pounds. Bauxite ore, the present source of metallic aluminum, is mined in Arkansas, Georgia, Alabama, and Tennessee, the output from these States combined amounting in 1911 to 1,555,618 long tons, valued at \$750,649, an increase of about 5 per cent. in both quantity and value, compared with the figures for 1910. The use of aluminum and its alloys in automobiles, dirigible balloons, and aeroplanes, is constantly increasing. In the form of magnalium it is used in the beams of analytical

balances, and other new alloys are being constantly brought to public attention. The metal is also employed in paper decorations and for wrapping, and is finding a host of applications in the smaller articles of everyday use and ornamentation.

AMHERST COLLEGE. The number of students enrolled in the several departments of the college in the autumn of 1912 was 430. The faculty numbered 49. The most interesting event in the history of the college during the year was the election of Dr. Meiklejohn (q. v.) to succeed President Harris. (See also UNIVERSITIES AND COLLEGES.) The most noteworthy benefaction of the year was \$157,160 for the Pratt Dormitory. The amount of productive funds of the college in 1911-12 was \$2,473,837. In the library were about 106,000 volumes. President, Alexander Meiklejohn, Ph. D.

ANÆSTHESIA. A French surgeon, Dr. Descarpentries, has introduced a new method of producing general anæsthesia, namely, by the intramuscular injection of ether. He has performed over 150 operations, major and minor, under this anæsthetic without complications, even in children and elderly persons. Successive doses of the anæsthetic proportioned to the weight of the patient (about 0.5 c. c. to the pound) are injected slowly into the gluteal muscles, care being taken to avoid striking the bone or piercing small blood vessels. Complete anæsthesia is induced in 15 to 20 minutes and consciousness returns slowly in about an hour after the last injection; sensation returns somewhat later. Alcoholic subjects seem to be especially amenable to this method. The first injection is very painful for a moment, and it is the practice of Descarpentries to give a preliminary inhalation of ethyl chloride or chloroform to obviate this, and sometimes to supplement the ether. The intramuscular method seems likely to be useful in operations upon the head, face, and respiratory passages, when an anæsthetist might impede the surgeon, and in country and military surgery, where an assistant is often lacking.

The intramuscular method is an outgrowth of intravenous anæsthesia, which has been noticed in previous numbers of the YEAR BOOK. By the intravenous route, ether, dissolved in normal salt solution in the proportion of 1.20, is thrown directly into a large vein. The danger of producing thrombosis or embolism has caused this method to be received with considerable reserve, although a total of 498 cases are on record with only two deaths; one from unknown causes and one from embolism.

LOCAL ANÆSTHESIA. Finsterer obtained complete anæsthesia of the entire abdominal viscera by what he calls "paravertebral blocking" of the spinal nerves. He introduces a long hypodermic needle close to the spinous process of the first lumbar vertebra, 3 cm. from the median line, and injects the nerve at its exit from the spinal canal, using a solution of novocain. The second and third lumbar nerves are treated in the same manner. Anæsthesia is complete in fifteen minutes, but when an abdominal operation is to be performed the skin has to be anæsthetized separately. This technic is, in comparison with spinal anæsthesia, harmless, but a good deal of skill is required to reach the proper points.

ANDRÉE, RICHARD. A German geographer and ethnographer, died February, 1912. He was born in 1835 at Braunschweig. He studied natural history at Leipzig and from 1859 to 1863 worked as foundryman in Bohemia for the purpose of obtaining information in relation to the German-Czech race conflicts. From 1891 to 1903 he was editor of the *Globus*. He became in 1902 professor at the University of Munich. His writings in relation to his observations in Bohemia are from the point of view of the German nationalist. They include *Nationalitätsverhältnisse und Sprachgrenze in Böhmen* (1870), and *Tschechische Gänge* (1872). His later works comprise *Zur Volkskunde der Juden* (1881); *Die Metalle bei den Naturvölkern* (1884); *Die Masken in der Völkervunde* (1886); *Die Flutsagen* (1891); *Braunschweiger Volkskunde* (1896); *Aufl. von Scobel* (1899), and *dazu Geographisches Handbuch von Scobel* (1899).

ANDREWS, WILLIAM SWAIN. An American soldier, lawyer, and public official, died December 29, 1912. He was born in Texas in 1841, the son of Stephen Pearl Andrews, the famous Abolitionist. He attended school in New York City and at the age of 18 he went on the stage, where, for a time, he acted with Edwin Booth. He went to the Civil War as lieutenant of zouaves and was later transferred to the signal corps under General Burnside. At the close of the war he returned to the stage and was on the stage of the Ford Theatre on the night of the assassination of President Lincoln. In 1868 and again in 1881 he was elected to the New York State Assembly and during the second term was speaker of that body. He secured the passage of the first pure-food law enacted in New York and was also responsible for the organization of the Society for the Prevention of Cruelty to Children. He was at one time collector of internal revenue of New York and in 1876, 1884, and 1888 was secretary of the Democratic national committee. During the Tilden campaign he was editor of the *New York Star*. In 1893-4 he was commissioner of street-cleaning in New York and in 1896 was made commissioner of records.

ANGLO-AMERICAN ARBITRATION.

See **ARBITRATION, INTERNATIONAL.**

ANGOLA. A west African Portuguese colony, with an estimated area of 500,000 square miles and a population of between three and four millions. St. Paul de Loanda is the capital. Tropical agricultural products are exported. The rubber supply is failing. The trade is mainly with Portugal. In 1909 the imports were valued at 5,674,861 and the exports at 5,485,085 milreis; transit, 326,349 milreis. Vessels entered, 1741, of 1,005,000 tons. Revenue (estimate) in 1909-10, 2,321,373 milreis; expenditure, 3,171,373. Work on the railway line from Lobito Bay, in the southwest frontier of Belgian Congo, which is to connect with the Central African system, is progressing. Total length of lines open for traffic in 1911, 821 kilometers. The colony is administered by a governor-general (in 1912, N. de Mattos).

ANNAM. A French protectorate on the China Sea; a part of the French colony of Indo-China (q. v.) Hué is the capital, with 65,000 inhabitants, and Bin-Dinh the largest town (74,400). The trade is included with that of French Indo-China. Raw silk, cattle, and agricultural and forest products are exported. There are valuable mineral deposits imperfectly developed. The native king (1912, Duy-Tan) is the nominal head of the government. He succeeded in 1907 at the age of eight and was placed under a council of regency. Internal affairs are actually administered by the French resident (1912, M. Mahé).

ANNELIDA. See **ZOOLOGY.**

ANNIVERSARIES. See **EXPOSITIONS.**

ANSCHUTZ, THOMAS POLLOCK. An American painter and instructor in art, died June 16, 1912. He was born in Newport, Ky., in 1851. He studied painting at the National Academy of Design in New York City until 1865, and afterwards at the Pennsylvania Academy of Fine Arts. He received instruction in Paris in 1892-3 under Doucet and Bouguereau. Although he achieved distinction with his paintings, he was best known as a teacher of painting. He was a member of the Pennsylvania Academy of Fine Arts from 1882 until the time of his death. Many of the most notable artists of the day received instruction at his hands. His paintings received honorable mention at the Art Club in Philadelphia, the silver medal at the St. Louis Exposition in 1904, the Walter Lippincott prize in Philadelphia in 1909, the gold medal of honor at the Pennsylvania Academy of Fine Arts in the same year, and a gold medal at the South American Exposition at Buenos Ayres in 1910. He was a charter member and president of the Philadelphia Sketch Club and was an associate of the National Academy of Design.

ANTHROPOLOGY. In 1912 there has been an unusual tendency toward the publication of textbooks briefly summarizing the present state of our knowledge with respect to anthropology. Thus, Marett has given an epitome of ethnological principles in his *Anthropology*; Sollas in his important book on *Ancient Hunters and their Modern Representatives* has presented a valuable outline of European archaeology, while briefer treatises emphasizing the physical traits of early man have been published by both Keith and Duckworth; Ranke offers a revised edition of his famous book, *Der Mensch*; Obermaier gives a full treatment of prehistoric European culture in *Der Mensch der Vorzeit*; Weule has written a very brief sketch of descriptive ethnography; and G. F. Wright presents an argument against excessive estimates of man's antiquity.

In ethnology the old struggle between the evolutionary and historical schools continues, as evidenced by Andrew Lang's rejoinder to Goldenweiser and Lowie on the subject of totemism, Lang still regarding totemism as a phenomenon essentially everywhere alike. However, such British ethnologists as Rivers and Marett now admit the method of historical analysis, and Rivers employs it in an interesting way to account for conventionalized art forms. Conventionalization, he argues, cannot be merely the result of inexactness in copying a realistic object, nor of technical factors alone, for such factors do not explain why, say, a human figure becomes conventionalized in one case into a lozenge and elsewhere into a spiral. Such instances become intelligible, however, from the interaction between two different tribes, one of which has developed a naturalistic art, while the other has originated a definite geometrical style.

While there is thus a movement toward the use of historical principles even in quarters where formerly schematic representations of cultural evolution were the rule, there has also developed a noteworthy difference among adherents of historical methods. This is due to the fact that Graebner, the chief advocate of such methods in Germany, practically eliminates the psychological element by defining as the sole object of ethnology the complete determination of how cultural features have been diffused from tribe to tribe, this diffusion, moreover, having never taken place, according to Graebner, by the adoption of single elements, but always wholesale, so that he does not hesitate to separate distinct strata in the culture of any particular group. Apart from this last-named feature, which most other students reject, Graebner's point of view appears narrow and formal to fellow-adherents of historical methods, who insist on the necessity of intensive consideration of psychological factors. This, for example, is where Rivers and Boas part company with Graebner. Graebner has been specially criticized for denying that similarities of culture can be explained by anything but historical contact. Against this view a number of critics have argued that certain similarities can be explained by the universal likeness of the human mind, which will react similarly to similar stimuli, especially where the number of possible reactions is limited by the nature of the case. Lowie has further contended that many so-called similarities that Graebner accounts for by historical contact are really no more

than superficial analogies and thus present no problem whatever. That is to say, phenomena that at first appeared to be identical have frequently turned out, on closer examination, to be radically different. Before raising the question at all, how two widely separated peoples have come to possess some common trait, we must, therefore, be sure that the traits are genuinely homologous and not merely analogous.

ANTIQUITY OF MAN AND PHYSICAL ANTHROPOLOGY. In October, 1911, an interesting skeleton was unearthed in Ipswich, England. Its position resembled the contracted posture characteristic of neolithic burials, but Professor Keith is of opinion that it might have been assumed without intentional arrangement. The teeth found in no way differ from those of neolithic man, and from the fragments of the skull Keith concludes that the head did not differ much from that of modern Europeans except for the single Neanderthaloid trait that the maximum width of the skull is situated rather far back. The tibia, however, also resembles the Neanderthal type in lacking the sharp anterior crest or shin of modern man. If the skeleton does not represent a burial and if the loam at this point is part of the original mantel of boulder clay, the man of Ipswich represents the earliest human form found next to the Heidelberg man, being in that case even somewhat older than the Galley Hill find. Unfortunately the geological age of both the Galley Hill and the Ipswich man has not been satisfactorily determined, for if of the same age, they would indicate the contemporaneous existence of two different types of man,—one with Neanderthaloid and one with modern traits.

A sensational find was made toward the close of the year in Sussex, England, of which only preliminary accounts are available. It consists of parts of a skull, believed to be that of a woman, and there is said to be evidence that its owner lacked the power of speech. Some authorities are reported to regard the skull as representing a very primitive type different from that of the Neanderthal man and find in its characteristics confirmation of the hypothesis just referred to, that two distinct species of humanity coexisted in Pleistocene times. However, in this case also there has not yet been a satisfactory determination of the geological antiquity of the skull. See article GEOLOGY.

In a recent article Boule describes his conception of Neanderthal man as a type below the average stature of the modern European, with an enormous head, a short and thick trunk and very stout limbs.

An interesting archaeological find of upper Aurignacian level consists of bas-reliefs of female figures in rock shelters of the Dordogne district. The figures show a curious development of steatopygia and resemble anatomically the modern Bushman type.

Professor Wright has put forward a critique of the arguments for the great antiquity of the human species and heroically defends the now quite discredited view that a space of fifteen thousand years suffices to account for the development of man and of human culture.

Loth has investigated the muscular system of the Negro and arrived at the conclusion that there are racial differences between the

soft parts of Caucasians and Negroes and that such differences also exist between Negroes and Mongolians, the Negroes occupying a morphologically lower position.

ETHNOGRAPHY

'AMERICAN. Blackfoot. Many of the religious conceptions of an important Plains tribe are discussed by Wissler in his *Ceremonial Bundles of the Blackfoot Indians*. The Blackfoot have developed a conception, apparently almost peculiar to them, that the medicine bundle secured by an individual through a supernatural revelation may be transferred to a second individual who offers an appropriate amount of property as a token of his gratitude. The benefits of practically every supernatural communication could be purchased in this way, the only exceptions being doctors' formulæ and certain individual experiences by which a man secured a presence within himself on which his life depended. Thus there arose a definite system with religious, social, and economic functions. To own and transfer many bundles is believed to result in long life, health, and happiness, secures social position, and is a good investment inasmuch as medicine bundles are readily convertible into property often much greater in amount than that originally offered by the seller. The purchase is effected through the offices of a middleman hired by the bundle owner. The buyer is regarded as the ceremonial "son" of the seller. A peculiarity of the Blackfoot bundle is its non-hereditary character. In general a bundle is transferred to a stranger, and even when a son does receive the bundle of his deceased father the customary transfer procedure is imperative. Foremost among Blackfoot bundles is that associated with the beaver. Its ritual includes a tobacco-planting ceremony analogous to that of the Crow Indians and is intimately related with the Sun Dance performance. There are indications that the Beaver bundle is the oldest, and as the mode of procedure in the rituals of the several bundles is strikingly uniform it seems that the other bundles have all been patterned on the Beaver medicine. The Medicine Pipe bundle is believed to have been handed down by the Thunder and must be opened at the sound of the first thunder in the spring. The Hako of the Pawnee, with its variants among the Teton, Arikara, and other tribes, is more in the nature of an adoption ceremony and does not seem to be genetically related to the Medicine Pipe ritual of the Blackfoot. In almost all the ceremonials of the Blackfoot incense is burned on an altar, the surface of which is worked out in symbolic designs by the use of colored earth. This is suggestive of the dry sand paintings of the Arapaho, Cheyenne, and southwestern tribes, but the combination of dry painting with an incense altar seems confined to the Blackfoot. Uhlenbeck has published a new series of Blackfoot texts.

Crow. Lowie has discussed the *Social Life of the Crow Indians*. The clan with maternal descent forms the unit of organization. Marriages within one's clan were not considered proper, and any transgressor was derided for having married his "sister." The clans, of which there were at least thirteen, were grouped together, mostly in pairs, but the larger resulting units were of a rather loose

character and cannot be considered exogamous phratries, as Curtis is inclined to do. While the paternal clan had little or nothing to do with one's marrying possibilities, it was important in other ways. Personal names were generally given by a clansman of the child's father, and nicknames were given to an individual on the basis of actions performed by his father's fellow-clansfolk. Further, there was a curious relationship obtaining among all those whose fathers were fellow-clansmen; any member in this group might play practical jokes on any other member and had the privilege of twitting him publicly with any foolish or contemptible deed he had done. Both in the definition of this "joking relationship" and in the exogamous clan system with maternal descent the Crow resemble their closest linguistic allies, the Hidatsa, but differ from all other branches of the Siouan family, among which definite social units are either lacking or have descent traced through the father. The government of the Crow was not unlike that of neighboring tribes. Those who had performed at least one of each of a number of definitely recognized deeds of valor formed a sort of aristocracy, and one of their number directed the movements of the camp. For the annual buffalo hunt one of the military societies was appointed as a constabulary force to prevent the premature startling of the herd. A man's war record largely determined his social prestige. Occasional disputes as to which of two men had actually performed some heroic deed were settled by an ordeal, which is noteworthy on account of the rarity of this institution among the American Indians.

Southeast. Swanton has published some of his studies of southeastern tribes. Most important among these are the Natchez, who are now shown to have spoken a Muskogean language and to have possessed a culture in many ways typical of the entire area, yet not without unique traits, such as the custom of strangling the relatives of a deceased person of prominence at his funeral. The Natchez probably acquired their clan system after settlement among the Oreek. They built mounds for their temples, which suggest a kinship with the Mississippi and Ohio cultures. The power of the chiefs seems to have been much greater than usual. Of the tribes still partly in existence the Chitimacha are the most primitive. They used wooden mortars and pestles similar to those found in the Woodland area of the United States, practised pottery, and are still skilful basket-makers. There was formerly a caste of noblemen who married only in their own class. Society was also divided into a number of totemic clans with descent through the mother. At the time of puberty a boy was subjected to a several days' fast in a temple, which no woman was permitted to approach. Each boy also underwent confinement for the purpose of securing a personal guardian spirit. Among the Gulf tribes the Biloxi were known as the solitary instance of a people with Siouan affiliations, but Swanton has discovered a second tribe of that family, the Ofo or Ofoyoula. Their dialect is closely related to that of the Biloxi, both languages showing kinship with Tutelo and other Fast Siouan groups and in a somewhat more remote way with the more northern representatives of the family, such as the Dakota.

California. Mason has contributed a study of *The Ethnology of the Salinan Indians* of southwestern California. Though geographically closer to the Chumash, who represent the southwestern Californian culture area, the Salinan were only in a moderate degree influenced by their southern neighbors and may be treated as slightly aberrant members of the central Californian culture group. They depend on acorns as the staple food, lack a gentile organization, and reveal but a weak development of war and ritualistic practices. Nevertheless, a number of similarities with the Chumash and Costanoan might lead to a grouping together of the three coastal stocks into one sub-area. Among these parallels are the use of communal houses, the greater importance of wealth and chieftainship, and the ceremonial smoking of tobacco. A noteworthy Salinan trait is the administration of jimson weed to boys in connection with a definite puberty ceremony.

Mexico. Numerous Cora texts published by Preuss afford a conception of the religion of this interesting tribe. Cora mythology is characterized by three principal deities, the Sun god, the Moon or Earth goddess, and the Morning Star, to which must be added an indefinite number of lesser beings representing the four quarters, as well as certain animals and plants. Most of the cosmological conceptions are symbolically represented, on a small scale, on the dance site of the tribe and on the inside of a sacred gourd decorated with patterns in beadwork. There are three principal ceremonies, all connected with the growth of cultivated plants. One of them is a sowing festival celebrated in the spring, while the others are harvest feasts revolving about the fresh corn cobs and roasted maize. In addition to these there are performances intended to produce rain and to remove disease, and in one village there is a feast for the promotion of the children's welfare. A peculiarity of the Cora as well as of the neighboring Huichol is the predominance of songs in their ceremonial activities, the chanting being continued throughout entire nights even without the accompaniment of dances or other ceremonial activities.

South America. In collaboration with Messrs. Holmes, Willis, Wright, and Fenner, Dr. Aleš Hrdlička has published a bulletin entitled *Early Man in South America*, as a critique of the claims frequently made, that osseous human remains of geologic antiquity have been found in South America. The verdict of the authors is purely negative, and the sources of error are pointed out.

Nordenskiöld, on the basis of South American studies, joins Graebner in the contention that American cultures have been influenced by those of Asiatic and Melanesian origin, though this view runs counter to that of most Americanists. See OCEANIA.

Leland Locke, after investigating specimens of old Peruvian *quipus* or "knot records," concludes that the quipu was not employed to record historical events other than dates and numerical data; that distances of the knots from the main cord were used roughly to locate the orders, which were on a decimal scale; that the colors used had no special significance, but were chosen according to the maker's fancy or convenience, though a rough color scheme is not excluded.

ASIA. As one of the results of the Riabouschinsky expedition Dr. Jochelson announces that the language of the Aleutians is an old Eskimo dialect, while that of the Kamtchatkans is of the same morphological type as some North American Indian languages. The mythology of the Kamtchatkans and Aleutians is that of the Northwest Coast Indians.

Dr. Laufer has published a monograph on *Jade; a study in Chinese archaeology and religion*. While primarily of interest to sinologists, this book contains matter of general ethnological importance, especially in a discussion of the Chinese stone age. Laufer rejects for one thing the utterances of Chinese philosophers as to the use of stone in the old days corresponding to our European palaeolithic epoch and followed by a neolithic era. Such remarks are pure speculations and are in line with a tendency to evolutionary theorizing among Chinese thinkers. In the present state of our knowledge it is not yet justifiable to speak of a stone age of China, and still less of a stone age of the Chinese as different from the more primitive aboriginal populations of the empire. The stone implements so far found are all polished, many of them with great elegance, so that they would be classed as neolithic. They are scattered in certain parts of the country and are generally rare. Two types occur, a cruder type in river beds or immediately beneath the surface, and a superior type in graves. It is, however, not certain that a chronological difference exists between the two, for the more elaborate forms may have been confined to ceremonial usage contemporaneously with the general use of the cruder implements for everyday purposes. No so-called stone work-shops have hitherto been discovered in China, and there is nothing to show that what stone implements have been found belong to a very ancient period of time. It is also important to note that Chinese records do not ascribe the occasional finds of stone tools to the ancestors of the Chinese, but view them with superstitious fear. As between ascribing certain stone finds to the Chinese or non-Chinese tribes, the more probable supposition seems to be that the latter were the manufacturers.

Some data on the Lolo, one of the aboriginal tribes inhabiting parts of the Chinese provinces of Szechuan, Yun-nan, and Kueichou, have been published by Herbert Müller. The Lolo do not form either a cultural or a physical unit, but belong together linguistically, all groups speaking tongues of Tibeto-Burman type. The Lolo of Kienchang in southern Szechuan are divided into two endogamous castes, the Nosu and Lesu, to which there is in some districts added a third class largely composed of captives and occupying the position of slaves. Even where the slave class is lacking, however, the social status of the castes differs, members of the Nosu devoting themselves exclusively to war, the chase, and horse-breeding, and leaving agriculture and other occupations to the Lesu. The Nosu differ from the rest of the population in their coiffures and the wearing of sandals. Culturally the Lolo present a primitive type. Metallurgy was originally unknown to them and pottery still is. Their own industries seem to be limited to the felting of garments, woodwork, tanning of skins, and the prepara-

tion of a varnish. Felted raincoats form the most characteristic articles of clothing. Their weapons consist of a long lance, a sword of Tibetan form, a small but strong bow and poisoned arrows resting point upward in a three-part quiver of possibly old Chinese pattern. The leather armor is of elaborate make, consisting of two large plates for the back and chest and a series of smaller plates, all of thick leather varnished yellow on the inside and red without. Lolo culture in general seems to indicate a fusion of a distinctly primitive with a distinctly high civilization.

OCEANIA. In reporting the results of explorations in the Bismarck Archipelago, Friederici develops some important ideas on the old problem of the connection between Oceanian and New World cultures, which has recently received considerable attention from Graebner. Friederici personally inclines to the view that the Malayo-Polynesian culture had representatives who reached the shores of America, though he regards the proof as insufficient. Among the parallels emphasized by him are the taboo against uttering one's own name, which occurs in his own field from Gealvink Bay to the Solomon Islands, and the use of mnemotechnic strings by both the Borriai of northwestern New Britain and the ancient Peruvians. Friederici insists, however, that even if Polynesians crossed the Pacific this must have taken place in relatively recent times and their influence cannot be accounted very great. Friederici insists that many parallels may be due to independent development due to the similarity of conditions, and thus takes a view decidedly opposed to that of Graebner. His position coincides very closely, however, with that of Dr. Dixon as expressed in the vice-presidential address at the Washington meeting of the American Association for the Advancement of Science (in *Science*, XXXV., pp. 46-55). Dixon does not deny that certain curious coincidences may be due to historical contact, but is equally convinced that American Indian culture is essentially of independent growth. From another point of view this conclusion has also been reached by Lowie (see above).

Torres Straits. Under the heading of "Arts and Crafts" (Vol. IV. of the *Reports of the Cambridge Anthropological Expedition to Torres Straits*), Professor Haddon, with the aid of several collaborators, has published a monograph on the material culture of the area. Generally speaking, the Torres Straits Islanders were horticulturists, but the Muraly people and their closest relatives are rather nomadic, depending upon wild fruit rather than on the cultivation of the soil. Owing to the absence of large game there was practically no hunting, but both sexes indulged in the quest for sea animals, the men specializing in the search for dugong and turtle while the women and children collected shellfish and fish imprisoned on the reefs. Basketry and plaitwork are the most important arts practised; the absence of string bags, so characteristic of New Guinea and Australia, is noteworthy. The dwellings differed considerably in the several groups of islands. Thus, in the east a round thatched hut was constructed, while the northern type of house was invariably built on piles and that of other islands represented the gable roof form. Bows and arrows, stone-headed clubs, and, in the west,

the javelin and spear-thrower are the most characteristic weapons. The last-mentioned is known to have been borrowed from the Australians. Among the most typical art products of the Straits are masks and effigies. Some of these are carved out of a single block of wood, but the most remarkable ones are of turtle-shell. These may represent either the human face or a complete animal, which may or may not be combined with a human face. The artistic skill exemplified in the construction of these elaborate masks also appears in the ornamentation of various articles of daily use. The extensive and faithful representation of animal forms is especially noteworthy. In the field of art there is very close relationship with the culture of the adjacent mainland of New Guinea and of the islands at the mouth of the Fly River.

Neuhauss, in a new work on German New Guinea, records observations on the Pygmies of that territory. The Pygmies no longer constitute distinct tribes, but there are many reversions to the Pygmy type in different regions, notably in the vicinity of Saddle Mountain. The Pygmies must be carefully distinguished from pathologically stunted Papuans. A short-trunked, long-limbed person, even if only 142 cm. in height, must be considered a dwarfish Papuan. On the other hand, men below 150 (and women below 140) cm. who have a long trunk and short extremities, a convex upper lip, a lobeless ear, and a relatively considerable tendency toward brachycephaly are probably representatives of the Pygmy race. Neuhauss also classifies the remaining populations of German New Guinea. The Papuans are old inhabitants, though more recent arrivals than the Pygmies, but the Melanesians are fairly recent intruders from the north and east, who occupied the coast or neighboring islands and have driven the Papuans into the interior without much racial blending taking place. Although there are many exceptions, the Melanesians are generally a coastal people. Politically they have gained a position of ascendancy and levy tribute from the Papuan natives, whom they dominate partly through their superiority as navigators, which enables them to cover large extents of territory.

AFRICA. A number of valuable special studies have been published on African ethnography, of which may be mentioned a study of Thonga social life by Junod. The Thonga are a Bantu tribe extending from the neighborhood of St. Lucia Bay on the Natal coast northward up to the Sabie River. Junod describes with great detail the initiation rites by which every fourth or fifth year all boys from ten to sixteen are admitted into the tribe. After running the gauntlet between two rows of initiated men who whip them, the boys are stripped of clothing and circumcised, whereupon they are secluded for three months in a carefully enclosed elliptical place tabooed to women, who are killed if by chance they catch sight of the leaves covering the wounds of the newly initiated. The novices are subjected to various trials of endurance and learn esoteric formulæ in addition to receiving practical instructions as to methods of hunting game. Toward the close of the probationary period they drink a medicine for purification and are taught to perform a masked dance, the masks forming a

very high helmet protruding like a beak in front. During the last night the novices are not allowed to sleep, but are led to a pool to wash, receive a final admonition and return in a grand procession to the capital of the tribal chief, where they are now recognized as full-fledged members of the tribe. A girls' puberty ceremony is not common to all the Thonga, but does occur among the northern groups. Several girls are secluded for a month, during which period they are obliged to take a daily bath in a pool, must submit to maltreatment on the part of their guardians, and receive instructions as to sexual matters.

Meinhof has made a comparative study of a number of African languages: Ful as probably the oldest of Hamitic tongues; Hausa as a West African dialect of Hamitic that has been influenced by Sudanese; Shillu as a representative of Berber speech; Bedauey as the northernmost of East African Hamitic languages; Somali; Masai; and the Nama dialect of Hottentot. In addition to important results of a purely linguistic character, such as the discovery of "polarity," viz. the tendency for masculine nouns to assume plurals of feminine form and vice versa, Meinhof arrives at conclusions of more general ethnological interest. All the languages dealt with appear to him as members of the Hamitic stock. All of them differ fundamentally in structure from the Sudanese languages, so that whatever resemblances occur must be due to recent borrowing. On the other hand, there are remote affinities with the Semitic and affinities still more remote with Indo-Germanic languages. Certain resemblances exist between the Hamitic and Bantu stocks, but the latter also display traits shared with the Sudanese dialects.

Pösch has expressed interesting views as to the famous Rhodesian antiquities to which some investigators have ascribed an Asiatic origin. According to Pösch, the stone ruins are not the remains of habitations but of fortifications, and the geological conditions of southern Rhodesia, where granite blocks of various sizes abound, invite such stone structures even among the Bantu of to-day, so that the theory of an alien origin appears unnecessary.

The Duke of Mecklenburg has published a popular account of his second trip to Africa, indicating some significant discoveries. The main body of the expedition proceeded from the mouth of the Congo to the Ubangi confluence, then up the Ubangi to Ft. de Possel, and thence northward through the Ubangi-Shari district to the Lake Chad region. In Bagirmi stone axes and hammer-like implements were discovered. The aborigines of this region have no cattle of their own, but secure milk from the immigrant Arabs and Fulbe. Special attention was paid to the interesting variations in Sudanese architecture, the circular ground plan common in the region being associated with all kinds of superstructures. Thus, the Gabri of the Benue district have bee-hive huts carefully thatched in the upper half, but with the lower part of the walls formed merely of long grass stalks descending irregularly toward the ground; the typical Bagirmi huts are walled with mats; and the Massa of the central Logone have thatched roofs and clay walls. Most peculiar of all are the houses of the Musgum living between the Logone and Shari Rivers, which are pointed

conical clay structures, the outside of which is decorated with curious bosses arranged to form a regular and distinctive pattern. The Musgum women wear flat discs in the upper and lower lips, causing a beak-like projection that suggests the appearance of the similarly deformed women of several South American and East African tribes. A detachment of the expedition under Drs. Schultze and Mildbraed ascended the Sanga and Djah Rivers, exploring southeastern Kamerun and marching thence to the coast. In the southeast they discovered Pygmies speaking a language distinct from that of the neighboring tribes, while the coastal Pygmies spoke merely the Mabea dialect of Bantu. The Pygmies are the elephant hunters of the region. They employ neither bows and arrows nor pitfalls on the hunt, but rely exclusively on long thrusting-spears. Another detachment under Dr. Schubotz traversed the Uele district toward the Nile, and made important observations on the Azande and Mangbettu. The Azande are divided into two sharply separated groups, the Abungura, who inhabit round huts with conical tops; and the Abandja, who dwell in rectangular houses with thatched pyramidal roofs and whitewashed clay walls decorated with paintings.

CONGRESSES, SOCIETIES, EXPEDITIONS. The XVIII international Americanist Congress met in London from May 27 to June 1, the United States being represented by Professors MacCurdy and Boas and Dr. Hrdlička. The agitation for a general anthropological congress not limited to the discussion of American problems was continued during the session. In September an international Congress of Anthropology and Archæology convened in Geneva. The first International Eugenics Congress met in London from July 24 to July 30. The American Anthropological Association and the American Folk-Lore Society met in Cleveland, O., from December 30, 1912 to January 2, 1913. Professor Dixon was elected president, and Professor Kroeber ranking vice-president of the Anthropological Association, and all other officers were reelected. The Folk-Lore Society reelected last year's officers. In the interests of the Bureau of American Ethnology Dr. Swanton has continued his investigations of the Southeastern Indians now resident in Oklahoma and Dr. Michelson has been engaged in studying several Algonkin languages. Doctor Hrdlička, of the United States National Museum, visited the Upper Yenisei region of Siberia. The American Museum of Natural History equipped expeditions to the Northern Blackfoot and Western Sioux (Dr. Wissler); Ute, Crow, and Eastern Sioux (Dr. Lowie); to the Menomini (Mr. Skinner); and began an archaeological reconnaissance of the lower Rio Grande district (Mr. Nelson). Professor Dixon of Harvard has been in India in order to study some of the aboriginal populations there. Professor Starr of Chicago has made a trip to West Africa. Under the auspices of the Geological Survey of Canada Dr. Goldenweiser has investigated the social organization and religion of the Iroquois, while Mr. Waugh has devoted himself to the material culture of these tribes; Dr. Radin began work on the Ojibwa; and Mr. Barbeau continued field-work among the Wyandot. Dr. Fewkes, by the co-operation of the Bureau of American Ethnology and Mr. George G. Heye, was enabled to resume his archæological researches in the

West Indies. The International School of American Archaeology and Ethnology in Mexico continued its linguistic and archaeological studies throughout the year, the work of the first half of the year being under the supervision of Professor Boas. Among his collaborators were Doctors Radin and Mason. Professor Moorehead of Phillips Academy, Andover, Mass., conducted an archaeological survey of Maine.

ANTI-BOYCOTT ASSOCIATION, AMERICAN. See **BOYCOTT**.

ANTIGUA. A presidency of the Leeward Islands (q. v.). United with it are the islands of Barbuda and Redonda. Negroes form the bulk of the population. St John, the capital (also the capital of the Leeward Islands colony), had (in 1911) 7910 inhabitants. There are no rivers and few springs in Antigua and droughts are frequent. Sugar, cotton, and pineapples are raised, the land under cultivation approximating 52,414 acres. In 1911, 11,075 tons of sugar and 5380 puncheons of molasses were produced. Trade (exclusive of internal) and finance statistics are shown below for four years:

	1907-8	1908-9	1909-10	1910-11
Imports..	£164,587	£175,587	£139,496	£170,033
Exports..	172,410	179,106	114,122	196,184
Revenue.	50,819	51,502	48,583	52,326
Exp'd'ure	46,967	49,964	49,304	53,495
Shipping*	567,678	722,862	643,966	644,705

* Tonnage entered and cleared.

Total customs revenue (1910-11), £31,782. Public debt (1910), £129,900. The governor of the colony is the administrator of Antigua. See **LEEWARD ISLANDS**.

APPOINTMENTS. See **NAVAL PROGRESS, Great Britain, General Progress**.

AQUEDUCTS. The Catskill aqueduct to supply Greater New York, and the Los Angeles aqueduct in California, continued to be the most important projects in this department of engineering. Both were reaching completion at the end of the year and both involved extensive distribution systems. In Europe no structures comparable with these were in progress, and outside of some work in Great Britain little of importance was to be recorded.

CATSKILL AQUEDUCT. During 1912 progress on the great project for the Catskill water supply to the Greater City of New York was made, and it had reached a point where much of the work was being carried on above the surface of the ground. The huge siphon passing 1100 feet below the Hudson River at Storm King was concreted and many of the sections of the aqueduct proper which range from 12 to 17 feet in diameter were finished. In New York City the deep water pressure tunnel was being excavated in the rock from the various

shafts which had been sunk at short intervals through the city. The Ashokan dam was practically completed at the end of the year, and progress had been made on the great Kensico dam, forming the storage reservoir for the city supply, the completion of which it was expected would not occur until 1920. The Kensico dam, which is 300 feet in height above the lowest part of its foundation, is almost 2000 feet in length, and was being built across the valley of the Bronx River just above the village of Valhalla. It was designed to impound a body of water 5 miles long by $4\frac{1}{4}$ broad at the widest point, or about 2218 acres with an irregular shore line at a height 15 feet below the top of the dam. The Catskill aqueduct was to empty into this lake near the northern end and the outlet will be at the centre of the western side, along which will be built a large by-pass through which water can enter the main supply aqueduct of the City of New York without passing through the reservoir. The Kensico dam is estimated to contain about 1,000,000 cubic yards of masonry, and the accompanying table has been prepared to show how it compares in size and massive construction with other similar works:

	Cubic yards
Kensico (estimated, in dam itself)...	1,000,000
Croton (New York City water supply), familiarly known as "New Croton"	855,000
Assouan (Egypt)	704,000
Ashokan (Board of Water Supply New York City), under construction 1912	550,000
Tansa (Bombay, India, Water Works)	408,500
McCall's Ferry (Pennsylvania)	300,000
Mochne (Germany)	353,200
Roosevelt (Arizona)	340,000
Gillepe (Belgium)	325,000
Wachusett (Boston water supply) ...	266,700
Cataract (Australia)	146,300

The Kensico dam was to be constructed with broad sloping buttresses of granite supporting the down stream face, divided into 22 panels of rough granite masonry with massive cut stones for the borders of the panels. This material was being obtained from a quarry but a few hundred yards distant from the dam, and was particularly available for this purpose. The dam was designed with expansion joints to provide for the action of frost and water and with drainage wells which carry off the inevitable leakage that must take place in such a structure. The dam itself was to be surmounted by a roadway 28 feet in breadth and was not to include the spillway, as this was to be built in a gully on the eastern hill, that lent itself to such a specific purpose. At the end of the year the excavations for the dam foundation were practically finished, and the preparations were being made for laying the cyclopean masonry which will form the bulk of the inside of the great dam. The construction is unique in that the rock required for the masonry and for the crushed stone is found on the site, so that work can be prosecuted with great economy. Wherever possible electric power is used, which is supplied by contract from high-tension lines.

LOS ANGELES AQUEDUCT. This huge project,

the progress of which has been noted in previous issues of the YEAR BOOK, in 1912 was rapidly nearing completion. During the year attention was directed particularly to the large inverted steel siphons used for crossing deep canyons and broad valleys. These steel pipes, which are among the largest ever constructed, range in length from 611 to 15,696 feet and vary in diameter from 8 ft. 6 in. to 11 ft., being constructed of steel ranging from $\frac{1}{4}$ in. to $1\frac{1}{8}$ in. in thickness, the thickness of course depending upon the pressure in the section where the siphons are required. For the shallower depressions where the pressure is light, reinforced concrete was used in building the siphons, but if the head is great, as in the case of the siphon crossing the Jawbone Canyon, where it amounts to 850 feet, the thickest steel is required. This particular siphon has a length of 8095.51 feet, but this is not the longest, as in the Antelope Valley, an arm of the Mojave Desert 35 miles from the nearest railway, 15,596 feet of steel pipe 10 feet in diameter were being laid, connecting at either end with concrete pipes designed to resist a lower pressure. At the lowest point in this siphon two 24-inch double disk Rensselaer gate-valves were placed, both for cleaning and for regulating the pressure, as in case of accident to the main aqueduct the flow could be diverted into the canyons with less damage than at the point of failure. The nine-mile siphon exclusive of the piers cost \$18.47 per linear foot or at the rate of \$5.18 per hundred weight, while in the case of the siphon crossing the Soledad Canyon even cheaper costs were effected. Here two sections were riveted together and a 12-foot length was hoisted into its position on the line. The estimated cost of the entire project was \$24,500,000 and the work, prosecuted by the Los Angeles Water Board itself, was being efficiently and economically carried on.

MANCHESTER AQUEDUCT. The project of increasing the water supply of Manchester by the construction of a third pipe line from Lake Thirlmere made satisfactory progress during the year, and the northern and middle sections were completed, and the various siphons were in course of being tested. On the southern section the pipe-laying was almost finished, as were the various crossings of railways, canals, etc. A notable subway 600 feet long and 14 ft. 6 in. in diameter had been built under the Manchester Ship Canal to carry the steel pipes, and this also was virtually completed at the end of the year.

GLASGOW. The project for increasing the water supply of Glasgow from Loch Arklet was nearing completion, and the tunnel leading to Loch Katrine was completely driven through during the year, the inlet basin at the west end being about half-finished. The project involved a large dam, a system of diverting pipes and other controlling works, and was reaching such completion that the use of the works in 1913 was anticipated.

ARABIA. See TURKEY.

ARBITRATION, INTERNATIONAL. The treaties of general arbitration signed August 3, 1911, between the United States and Great Britain and France (see YEAR BOOK 1911), which were so widely debated while pending before the Senate, were formally ratified by that body on March 7, 1912, by a vote of 76 to 3, but only after they were amended by a vote of

42 to 40 by striking out the following: "It is further agreed, however, that in cases in which the parties disagree as to whether or not a difference is subject to arbitration under Art. I. of this treaty, that question shall be submitted to the Joint High Commission of Inquiry; and if all or all but one of the members of the Commission agree and report that such difference is within the scope of Art. I., it shall be referred to arbitration in accordance with the provisions of this treaty." In the opinion of the advocates of these treaties the Senate's amendments deprived them of much of their special merits, but the treaties even as amended are important steps in advance because for the first time they make the legal character of a question the test of its arbitrability. Previous treaties have left arbitrability to the capricious judgment of the disputants at the very time when their dispute was hottest.

The year 1912 has seen few new treaties of arbitration negotiated. This was largely due to the fact that the 154 existing treaties pretty well cover the ground. The World Peace Foundation has prepared the following chronological summary of these treaties: 1899, 3; 1901, 1; 1902, 12; 1903, 6; 1904, 26; 1905, 23; 1906, 4; 1907, 5; 1908, 22; 1909, 32; 1910, 18; 1911, 10; 1912, 1. Gross total, 163. Duplicated supersessions, 9. Net total, 154. Notwithstanding that the field has been so widely covered and that the Spanish-American countries are so busily building up an extensive network of bipartite treaties, there is a general impression that there has been a slight recession in the movement for international arbitration, an impression which is strengthened by the fact that the trustees of the Nobel prize fund are of the opinion that nothing occurred during 1912 of sufficient merit in this realm or that of the peace movement to justify the award of the Nobel Peace Prize. Another fact to the same effect has been the prevalence of war—first between Italy and Turkey, and later between the Balkan States and Turkey. These, however, are generally recognized as wars which could not be arbitrated any more than could the late Civil War in the United States.

The French Ministry of Foreign Affairs has established a bureau to deal with questions of international arbitration and the periodic Hague conferences. This bureau's duties are "the conclusion of treaties of arbitration with certain states and the search for the formulas best adapted to the circumstances" in the case of all states.

There has been steady progress in the arrangements between the United States and Great Britain to carry out the provisions of the North Atlantic Fisheries arbitration award of the Hague Court and to adjust the pecuniary claims between the two nations. This work does not seem to have been impeded in any way by the fate of the treaty with Great Britain or by the Panama affair. An agreement was reached November 15 between the American government and that of Great Britain as to the composition of the tribunal for the arbitration of these claims. Sir Charles Fitzpatrick, Chief Justice of Canada, will represent Great Britain, and Chandler P. Anderson, counselor of the Department of State, will represent the United States. The third member of the tribunal will be chosen by these two, and will not be a citizen of either the United States or of Great Britain. Cecil J. B. Hurst, of the British Foreign Office,

will be chief counsel for Great Britain, and Edmund L. Newcombe, Canadian Deputy Minister of Justice, will be associated with him. Severo Mallet-Prevost, of New York, will be chief counsel for the United States. Robert Lansing, one of the counsel for the United States in the fisheries arbitration and the Alaska boundary arbitration, will be associated with him. The amount claimed on both sides amounts to about four million dollars, and a schedule of these claims has already been agreed upon. The treaty (that of July 20, 1912) under which this tribunal is created provides that all outstanding claims between the two countries shall be submitted to arbitration, and a supplemental schedule may be submitted to the tribunal before it meets early in the year 1913. For an account of the question with Great Britain concerning the Panama Canal tolls, see PANAMA CANAL.

UNITED STATES AND CANADA. The International Joint Commission between the United States and Canada met in Washington January 11, 1912, in accordance with the treaty between the United States and Great Britain, signed January 11, 1909, and proclaimed May 13, 1910. In the words of Commissioner Tawney "the treaty has provided a means for frank, direct and constant relations between the two great neighboring peoples who inhabit the greater part of the North American continent and who must live in amicable relations to realize the ultimate ideal of an Anglo-Saxon civilization. This commission constitutes the medium for this direct communication, and to it, by the express terms of the treaty, may be referred for consideration and settlement all questions of differences that may arise between the peoples living along one common frontier . . . it expressly authorizes, clothes this commission with jurisdiction to consider and determine all questions of difference, without reservations or qualifications of any kind . . . This may be called a miniature Hague Tribunal of our own; just for us English-speaking nations of the continent of North America." The American Commissioners are: James A. Tawney, Frank Sherwin Streeter, and George Turner. The Canadian Commissioners are: T. Chase Casgrain, Henry A. Powell, and Charles A. McGrath.

THE AISOPS CLAIMS. Early in September, 1912, these claims were paid, and what some years ago threatened the amicable relations between the United States and Chile was settled finally with only passing comment. The Alsops did business in Peru, Bolivia, and Chile, dealing in guano, hides, and minerals. These three nations a generation ago were involved in a war in the progress of which property of this country was destroyed. The first two countries named settled the claims against them, but Chile refused on the ground that the claims had to do with certain lands which had been subsequently ceded by Bolivia to Chile. The American government proposed arbitration by the Hague Tribunal, but this was not welcomed by the Chilean government, which finally consented, however, to refer the claims to the good offices of Edward VII., King of England, as arbitrator. On the King's death the dispute was submitted to his successor, George V. In August acting on the report of Lord Desart, Lord Robson, and Mr. Hurst, whom he had designated to study the case, King George pronounced his award, assigning a sum about

one-third as much as the original amount of the claim to the Alsops in full settlement. In commenting upon this satisfactory outcome of the only outstanding disputed question with Chile, *The Outlook* said: "The case is generally interesting as being one of the few nowadays for which the good offices of the International Court of Arbitration at the Hague were not successfully invoked. Chile, though evidently willing to have the matter settled by arbitration, would not accede to our government's request to submit the case to the Hague court. Doubtless the Chileans thought that they might come off with better grace by submitting to more old-fashioned and more elastic arbitral methods. At all events, Latin-American pride seemed ruffled at a suggestion of the Hague's supposedly sterner justice. The old order naturally persists, especially among emotional peoples."

OTHER LATIN-AMERICAN QUESTIONS. The Hague Tribunal on May 3, 1912, rendered an arbitral award in regard to the claim of the Canevaro Brothers, in which it decided that the Peruvian government should pay to the claimants the sum of £39,811, 8s., 1d., with interest in the sum of £9338, 17s., 1d. The Chamizal district near El Paso, Tex., has long been in dispute between Mexico and the United States. About two years ago it was decided to arbitrate the ownership of the disputed land and to mark a boundary. A joint commission was organized and has been at work for over a year, and this troublesome question will in all likelihood be satisfactorily and definitely settled at an early date. A commission appointed March 30, 1911, to determine the Bolivia-Peru boundary question presented its report in July, 1912. Another commission for the settlement of a similar question has been appointed. On December 20, 1912, the American state department was advised that the Ecuadorian government had appointed an arbitrator in the dispute between that government and the Guayaquil and Quito Railway Company. This railroad, an American corporation, in 1911 had rendered extensive service to the Ecuadorian government on account, especially during a revolution. Ecuador made no provision to pay, but kept on using the service. The United States interposed its good offices and in 1912, at the request of Ecuador, both governments named arbitrators to pass upon the claims under the terms of the railroad contract. The Santo Domingo-Haiti boundary line uncertainty has been temporarily cleared up by the United States which has indicated a provisional line without prejudice to the rights of either and arranged for the determination of the *de jure* line. On January 21, 1912, a treaty of peace between Argentina and the United States of Colombia was signed, in which practically every question involving sovereign rights in international disputes, except those which may conflict with provisions of the constitution of either country, may be settled by arbitration. The United States is preparing a protocol submitting to arbitration the claim of John Celestine Landreau against Peru, arising out of contracts and transactions in connection with the discovery and exploitation of guano that had been under discussion since 1874.

EUROPEAN QUESTIONS. On November 11, 1912, the Hague Tribunal rendered a decision in the long-standing indemnity dispute between Turkey and Russia, dating back to the war of

1877-1878. The decision was favorable to Turkey and involved the question of additional interest on the war indemnity. The Turko-Italian War resulted in a question between Italy and France relative to the seizure of the French mail steamers *Carthage* and *Manouba* in January. On March 6, 1912, it was agreed to leave the matter to the Hague court and the case comes up for trial in March, 1913. (See FRANCE, *History*.) The stopping of the *Tavignano* at about the same time caused the appointment of a commission of inquiry, which reported in July to the principals a decision which will be reviewed by the Hague court in connection with the other case.

PRESIDENT TAFT AS A PACIFIST. In the view of the American Peace Society, President Taft has been more than a moralizing philosopher. In the words of its organ, *The Advocate of Peace*, "he has attempted and accomplished large concrete things for the cause of international peace. The expansion of the Bureau of Trade Relations has been not only a means of industrial advance, but of international goodwill. When confronted with the acute situation growing out of the question of Japanese competition with our laborers of the Pacific States, he not only avoided the 'competition' by means of a treaty with Japan, but doubled our exports to that country in three years, and brightened perceptibly the chances of an unlimited arbitration treaty between the two countries. By influencing American bankers to participate in the Hukuang loan, and subsequently in the reform of Chinese currency, the friendship of China for the United States was promoted, our exports to that country increased 50 per cent. in two years, and international goodwill increased among the concert of great powers in China. It was President Taft's hand that preserved the independence of Liberia and brought back to life that interesting little waif of ours. During the Taft régime Venezuela has sloughed off Castro and enjoyed a fuller measure of peace. Zelaya has fortunately been deposed in Nicaragua and the Emery claim settled. The Alsop case has been disposed of and the troubles of a generation with Chile ended. American leadership has shown Nicaragua the way to financial integrity, and Honduras is about to accept our guidance in its business affairs, as has Santo Domingo. The boundary dispute between Panama and Costa Rica has been settled through the influence of the United States. The whole Central American situation has been spared further encroachments of Zelayaism by our government's recent stand for orderly government in that section. A 'United States of Central America' is appreciably nearer because of the Taft policy of Pan-American friendship and goodwill. President Taft's self-restraint before the turmoils of the Republic of Mexico has subverted the interests of 40,000 of our people residing in that country and been an inspiration to all Christian civilization. In conjunction with Argentina and Brazil he has been able to prevent war between Haiti and Santo Domingo, and to stop the onrush of civil war in Honduras. War in Cuba has been forestalled by vigorous warnings from our government. The fisheries dispute with Great Britain, dragging down through two generations, has been settled at the Hague. The Passamaquoddy Bay dispute has been arbitrated, and the seal fisheries disputes between our country, Great

Britain, Japan, and Russia have at last been settled without a hint of arms. Three tantalizing cases have been satisfactorily settled with Venezuela. A boundary dispute between our country and Mexico has been referred to a commission. A treaty of arbitration covering ancient pecuniary claims between the United States and Great Britain has been ratified. The Taft administration has been indefatigable in promoting the International Court of Prize and the International Court of Arbitral Justice, the former a supreme court of war and the latter a supreme court of peace, both of which are all but established."

INTERNATIONAL CONGRESS OF CHAMBERS OF COMMERCE. The fifth congress, which met in Boston, September 24-26, 1912, and was attended by upwards of 500 foreign delegates, was in some aspects converted into a great arbitration congress. A thorough-going resolution was offered by the president, Mr. Canon-LeGrand, declaring not only for the highest possible extension of international arbitration and the establishment of the court, but for the union of nations to avert the atrocity of war. French, English, German, and American voices seconded the resolution; and when it was passed amidst tumultuous applause, all present rose to their feet in the inspiration of the moment, and many sprang to their chairs and waved their hats. The meeting was regarded as highly significant and as a most important step toward the promotion of coöperation between the great commercial bodies of all nations and as advancing the cause of international peace.

UNIVERSAL PEACE CONGRESS. The nineteenth congress was held at Geneva September 23 to 28. In point of numbers it compared favorably with most of the preceding sessions, the enrollment reaching something over 500 (270 delegates and the rest individual members). Twenty countries were represented, namely, the United States, Germany, France, Austria, Russia, Italy, Spain, Great Britain, the Netherlands, Belgium, Denmark, Finland, Hungary, Norway, Sweden, Poland, Portugal, Switzerland, Turkey, and Egypt. There were twenty-nine delegates from the United States. As pointed out by the *Advocate of Peace*, "the composition of the congress, the size of the delegations from the European countries, and the general spirit of the meetings were a striking testimony to the deep and growing hold which the movement is taking on the Old World. The delegates were for the most part thoroughly serious and capable men and women, having a clear conception of the aims of the movement and sincerely and courageously consecrated to their realization. In this aspect of it the congress impressed us as one of the most notable ever held. The devotion and courage of the European pacifists seemed to us to have been deepened and intensified by the discouraging events of the past year." The congress did its work, as heretofore, through committees made up of representatives of the different countries. Each national delegation was allowed two representatives on each of the committees. These committees examined in advance all the important topics on the program and presented resolutions for discussion and adoption. These resolutions covered a great variety of subjects and made an extended programme. Prominent on the agenda were the subjects of limitation of armaments, arbitration treaties, a court of ar-

bitral justice, the use of airships in war, the enforcement of arbitral awards, the causes of war, commercial boycott as a means of preventing wars, peace education, propaganda work, and a number of questions of current politics, namely, Alsace-Lorraine, Tripoli and Morocco, Egypt. There was considerable confusion at numerous sessions because of marked difference of opinion concerning Italian, Moroccan, and Egyptian questions.

The Seventeenth Conference of the Inter-parliamentary Union was held at Geneva, September 18 to 20 in conjunction with the Peace Congress. The enrollment reached 160. In former conferences the attendance has been three or four times that number. There were only four representatives from the United States group, namely, Senator T. E. Burton, Congressman Richard Bartholdt, Frank Plumley, and William D. B. Ainey, as against fifteen or twenty in other years. The absence of the Italian representatives, because of the war in Tripoli, also contributed seriously to the reduction of numbers. It was noteworthy that the men present were very largely those who are doing the real work of the Union in the different countries. The discussions dealt directly with the phases of the movement for which the Union has most stood—arbitration treaties, the court of arbitral justice, limitation of armaments. An effort was made to widen the scope of the labors of the Union, and it is probable that international relations generally will hereafter be included in the programme. Dr. A. Gobat, for years the executive secretary, a delegate from Switzerland, served as acting president.

THE WORLD CONFERENCES FOR PROMOTING CONCORD BETWEEN ALL DIVISIONS OF MANKIND (G. Spiller, 63 South Hill Park, London, N. W., secretary) has issued a statement declaring among other matters that the present national congress secretariats and committees are requested to continue to act, and will be, if possible, extended to all countries; the national and local secretariats and committees should encourage their government, municipalities, associations, and clubs, etc., to admit no discrimination on the ground of race and color; they should organize annually one national and many local inter-racial conferences or public meetings; they should approach ministers of education, and other cabinet ministers subsidizing education, to permeate the teaching with racial concord; they should endeavor to win over the churches and other humanitarian organizations to the cause of inter-racial amity, and induce them to arrange for regular annual addresses on the subject; they should collect for the central executive an album containing at least 100 photographs of educated men and women of their country or people.

THE CONGRESS OF JURISTS provided for at the Third International American Conference at Rio de Janeiro, August 23, 1906, composed of one representative from each of the signatory states for the purpose of preparing a draft of a code of public international law and a draft of a code of private international law to regulate the relations between American nations was held in Rio de Janeiro, June 26, 1912. There were present delegates from fourteen states. Dr. Epitacio Pessoa of Brazil was chosen permanent president. A committee on permanent regulations reported that in view of the magnitude and difficulty of the task, the

attempt to proceed immediately to the adoption of codes was impractical, but agreed to recommend the appointment of two special committees respectively to report drafts on extradition and the execution of foreign judgments. The draft prepared by the first committee was approved, but there was disagreement as to the second. The congress then provided for six sub-committees to prepare codes, four dealing with public international law and two with private international law, and to meet again at Rio de Janeiro in June, 1914, to hear the reports of these committees.

The Eighteenth Annual Lake Mohonk Conference on International Arbitration was held May 15-17 with President Nicholas Murray Butler as chairman. The international delegates were especially numerous. The founder of these conferences, Albert K. Smiley, died in November, 1912, at Redlands, Cal., in his eighty-fifth year. Under his thoughtful and effective leadership these conferences have exercised a wide influence on the movement for international arbitration and justice. In the judgment of competent observers no one man in his generation accomplished more for it. He lived to see the principle of arbitration well established. The conferences will be continued by his brother and coadjutor, Daniel Smiley.

THE AMERICAN ASSOCIATION FOR INTERNATIONAL CONCILIATION (407 West 117th street New York City) has issued the following leaflets during 1912: Special Bulletin: "War Practically Preventable, and Agreements for Universal Peace," by Rev. Michael Clune, June, 1912; "The International Mind," opening address at the Lake Mohonk Conference on International Arbitration, by Nicholas Murray Butler, June, 1912; "The Irrationality of War. On Science as an Element in the Developing of International Good Will and Understanding," by Sir Oliver Lodge, July, 1912; "The Interest of the Wage-earner in the Present Status of the Peace Movement": address delivered at the Lake Mohonk Conference on International Arbitration, by Charles Patrick Neill, August, 1912; "The Relation of Social Theory to Public Policy," by Franklin H. Giddings, September, 1912; "The Double Standard in Regard to Fighting," by George M. Stratton, October, 1912; "As to Two Battleships," contributions to the debate upon the Naval Appropriation Bill in the House of Representatives, November, 1912; "The Cosmopolitan Club Movement," by Louis P. Lochner, December, 1912; "The Spirit of Self-Government:" address delivered at the 144th Anniversary Banquet of the Chamber of Commerce of the State of New York, by Elihu Root, January, 1913. A small edition of a monthly bibliography of articles having to do with international matters has also been published and distributed to libraries, magazines, and newspapers.

Leaflets issued previously included papers by Baron d'Estournelles de Constant, George Trumbull Ladd, Elihu Root, Barrett Wendell, Charles E. Jefferson, Seth Low, William James, Andrew Carnegie, Philander C. Knox, Pope Pius X., Heinrich Lammasch, Norman Angell, and others.

THE WORLD PEACE FOUNDATION (formerly the International School of Peace), 290 Beacon street, Boston, has issued the following pamphlets during 1912: No. 4, part I., "Concerning Sea Power," by David Starr Jordan; part II., "Heroes of Peace," by Edwin D. Mead;

part III., "International Good Will as a Substitute for Armies and Navies," by William C. Gannett. No. 5, part 1, "The Drain of Armaments," by Arthur W. Allen; part II., "The Truth About Japan," by John G. De Forest; part III., "The Cosmic Roots of Love," by Henry M. Simmons; part IV., "World Scouts," by Albert Jay Nock; part V., "The Right and Wrong of the Monroe Doctrine," by Charles F. Dole. No. 6, part 1., "The World Peace Foundation: Its Present Activities"; part II., "Neutralization: America's Opportunity," by Erving Winslow; part III., "William T. Stead and His Peace Message," by James A. Macdonald; part IV., "Educational Organizations Promoting International Friendship," by Lucia Ames Mead; part V., "Revised List of Arbitration Treaties," compiled by Denys P. Myers. No. 7, part I., "Heroes of the Sea," by W. M. Thackeray; part II., "The Forces that Make for Peace," by William J. Bryan. A full report of the activities of the Foundation was published in July as No. 6, part 1.

THE AMERICAN SOCIETY FOR JUDICIAL SETTLEMENT OF INTERNATIONAL DISPUTES held its third annual conference in Washington, D. C., December 20-21, 1912. The first conference (Washington, 1910) was devoted to the subject of the advantages of, and the best way to secure, a true international court of justice. The second conference was devoted largely to the momentous question of the proposed arbitration treaties with Great Britain and France, and at the third conference the general subject of an international court and the essentials of the law to be applied therein were considered, as was also the subject of the sanctions of international law. Governor Baldwin of Connecticut presided. The Society during 1912, published the following leaflets: "The Proposed Arbitration Treaties With Great Britain and France," by William Howard Taft (February, 1912); "Non-Justiciable Disputes and the Peace Treaties," by Omer F. Hershey (May, 1912); "The International Grand Jury," by William I. Hull (August, 1912); "The Court of Arbitral Justice," by James Brown Scott (November, 1912).

The Fourth Central American Conference was held at Managua, Nicaragua, January 1-20, 1912, with representatives from Costa Rica, Salvador, Guatemala, Honduras, and Nicaragua present. The *Pan-American Bulletin* gives as the purpose of these annual conferences "to consider the most efficient and proper means of bringing uniformity in the economic and fiscal interests of Central America."

The Fourth American National Peace Congress will be held in St. Louis May 1, 2, 3, under the auspices of the Business Men's League of that city. The preceding congresses have been held as follows: New York, 1907; Chicago, 1909; Baltimore, 1911.

THE INSTITUTE OF INTERNATIONAL LAW held an annual session at Christiania, Norway, August 24-31, 1912. A proposal was made by Alejandro and James Brown Scott to establish an American Institute of International Law.

THE AMERICAN SOCIETY OF INTERNATIONAL LAW held its sixth annual meeting at Washington April 25-27. The programme was devoted to the organization and procedure for the Third Hague Conference which is to meet on or about 1915. The Honorable Elihu Root presided.

CHURCH PEACE LEAGUE. The federal council

of the Churches of Christ in America, at its quadrennial conference in Chicago, December 9, adopted the following plank, submitted by Rev. Charles E. Beals, Field Secretary of the American Peace Society: "The Council favors the organization of a church peace league in America, the annual observance of peace Sunday by the churches, and the memorializing of the Third Hague Conference in behalf of the establishment of a permanent court of international justice and the adoption of such other measures as shall render war unnecessary and impossible. It calls upon Christian men and women to unite in a demand that the teaching and spirit of Jesus be applied in international relations by our national Congress and Department of State."

ARBITRATION AND CONCILIATION, INDUSTRIAL. It has come to be generally recognized that more efficient means of insuring industrial peace must be developed in the United States and Great Britain and on the continent of Europe. Various plans are in vogue designed to achieve this end, including trade agreements, various forms of arbitration and conciliation through representatives of both parties or through government officials, profit sharing, and welfare work. The necessity for continued industrial peace increases with the growing complexity of economic life. The increasing division of labor involves an increase of mutual dependence. The welfare of the public at large comes more and more to rest not only upon the various forms of public service utilities, but ever upon an increasing number of manufacturing, mining, and agricultural pursuits. Moreover, with the increase of class consciousness in the laboring population, accompanied as it is by the development of trade unionism, strikes tend to become wider in scope and therefore much more injurious to public convenience and welfare. There are those who hold that permanent industrial peace is impossible under the present organization of industry because of the necessary opposition between the interests of employer and employee. The one seeking profit fears his returns will diminish with every increase of wages or shortening of hours. At the same time, the doctrine that the public interest predominates over the interest of either employer or employee has been so widely accepted that both the latter parties have been forced by public opinion to effect reasonable agreements much more frequently than heretofore. Appeal must be made not to force, but to the sense of justice of the community. The tendency of thought therefore is toward either some form of compulsory arbitration enforced by the political sovereign or some form of public investigation with reliance upon public opinion to compel the disputants to accept the judgment of impartial arbitrators. Compulsory arbitration has met with considerable success in Australia and New Zealand. Compulsory investigation by an impartial board whose findings are enforced by public opinion is embodied in the Canadian Trades Disputes Investigation act. A similar law has been enacted in Wisconsin. Moreover, the Boston Chamber of Commerce in December took steps toward securing the enactment of such a law in Massachusetts. An inquiry by the British board of trade showed that European countries are now endeavoring to prohibit strikes in the public utilities or in the public services.

THE CLOAK AND SUIT INDUSTRY. One of the most unique forms of trade agreement yet effected in this country is that which followed the great strike in the ladies' garment industry of New York City. This industry includes about 2000 establishments employing 50,000 workers and representing \$40,000,000 of capital; its annual output approximates \$250,000,000. Under the agreement effected between the associated employers and the workers' union not only has peace been preserved, but conditions of workers have steadily improved. The union is definitely recognized and preference is given its members, though the closed shop is not maintained. This agreement provided for a grievance board of five representatives of the employers' association and five of the International Ladies' Garment Workers' Union. This meets weekly to settle all disputes as to wages and hours. Appeal may be made from this board to a permanent board of arbitration of three prominent citizens. In addition there is a joint board of sanitary control with representatives of the employer, the employed, and the public. This board has greatly reduced the danger from fire, has abolished basement shops and is steadily raising the sanitary conditions of the establishments. By the fall of 1912, 319 shops had been certificated as meeting all of 28 conditions laid down by the board. In addition a campaign of education by bulletins and lectures with reference to sanitary conditions is carried on. See STRIKES.

RAILWAY ENGINEERS. Late in 1911 the engineers of fifty-two eastern railroads, numbering about 30,000, made a demand for increased pay, uniform classification of service, and uniform working rules. Their demand being refused a referendum was held in January which showed 93 per cent. of the men ready to strike. Through the intervention of the commissioners, Neill and Knapp, under the Erdman act, the dispute was submitted to a board of arbitration composed of Oscar S. Straus, of New York, Charles R. Van Hise, president of Wisconsin University, Albert Shaw, of New York, Frederick W. Judson, of St. Louis, Otto M. Eidlitz, of New York, Daniel Willard, president of the Baltimore and Ohio Railroad, and P. H. Morrissey, representing the railway engineers. This board began hearings in July and rendered its decision in November. The award dated back to May 1, and holds until May 1, 1913. Advances in pay were granted, but not as extensive as the men demanded. The total annual increase in the engineer's wages of all the roads was estimated to be augmented by something over \$2,000,000, whereas the original demands would have made a total increase of over \$7,000,000. The larger and better roads were little affected, but on some small roads very extensive changes were made. The arbitration board reported in favor of a compulsory adjustment of disputes on public utilities by States or national wage commissions because of the fundamental importance of these industries to the welfare of all persons and all other industries. Mr. Morrissey did not assent to the rates fixed by the board because in his view they were based on unreliable statistics and because he objected to the principle of compulsory arbitration. This was believed to be the most important case of industrial arbitration from the viewpoint of public welfare since the great coal strike of 1902. The railroads involved operate 40 per cent. of

the total mileage in the United States, covering the area east of Chicago and north of Virginia.

In May the firemen of these same roads put forward a demand for increased wages, for new rules as to hours and overtime, and for extra firemen on freight locomotives. Their demands were modified on December 18 to include extra firemen on only 2000 engines. Moreover, they preferred to arbitrate under the Erdman act rather than strike.

ANTHRACITE MINERS. The superiority of conciliatory methods to open hostility in effecting trade agreements was forcibly illustrated by the work of the anthracite conciliation board. This board was established by the commission which settled the strike of 1912. It is composed of six members, three representing each side. An award by majority is final. In case of the tie a federal circuit judge acts as umpire. This has brought about three successive agreements of three years each, the last expiring April 1, 1912. It also deals with grievances. During the first three years it dealt with 145 grievances and in the six years 1906-12 with 48. Altogether 25 cases were referred to the umpire. The agreement provides that no strike or lockout shall be declared during the deliberation of the board, but this rule has not been rigidly observed. Early in the year efforts were made to effect a new agreement. The anthracite miners, numbering about 175,000, demanded a 20 per cent. increase of wages, a one-year contract, a minimum scale of \$3.50 per day for miners and \$2.75 per day for laborers, and minor concessions. The coal operators refused. Agreement was finally reached early in May on the basis of a 10 per cent. increase in wages, but with the abolition of the sliding scale whereby wages were correlated with prices; the net gain to the miners was about 5½ per cent. Though the miners at first refused to accept this agreement and there was some rioting and mob violence leading to three deaths at the hands of the State constabulary, nevertheless their convention May 14 assented, largely because the union membership had fallen to less than 30,000 and union funds amounted to less than \$200,000. The settlement was at once followed by an increase in the wholesale price of coal of 25 cents per ton. This increase would net the companies over and above the increase of wages an amount estimated at \$4,000,000 to \$6,000,000 a year. This occasioned universal public objection and caused investigations to be begun by many public authorities all over the eastern part of the country, including the United States district-attorney for Pennsylvania.

There was a similar cessation of work in bituminous mining in April, more than 2,000,000 men being idle. Adjustment of demands was made by conciliatory methods, an increase of five cents per ton being given.

CANADA. The Industrial Disputes Investigation act of 1907 has gained in favor. Growing out of a coal strike it was made to include not only mines but steam and electric railways, steamships, telephone and telegraph lines, and lighting and power works. The act requires that before a strike or lockout investigation must be made by a board to which each side appoints one member, these two choosing a chairman. In case of disagreement the government appoints the chairman. This board

tries conciliation first; if this fails it investigates and publishes the facts and its decisions. Public opinion is relied on for enforcement, the disputants having legal right to cease operations. In more than five years up to December there had been 132 boards, of which 53 were in railways and 40 in mining. There had resulted only 15 strikes, only 4 of which were on railways. The act has thus been of great service to employers, employees, and the public.

AUSTRALASIA. The states of the Australian Commonwealth and New Zealand have thus far been most successful in dealing with trade disputes. They have developed two methods. One of these involves the use of wage boards and the other a resort to industrial courts. These two institutions are combined also. The Australian legislation is designed not only to preserve peace, but also to prevent sweating, by the establishment of a fair and reasonable level of wages. (See **MINIMUM WAGE**.) Therefore collective bargaining is encouraged; this has led in New South Wales to the legal incorporation of unions under prescribed conditions imposing legal responsibility on their funds. Indeed as a rule preference is given to the trade union because of its importance in enforcing collective responsibility. In New Zealand cases are taken up first by boards of conciliation, from which appeal may be made to the Industrial Court. Similarly in Victoria appeals may be made from wage boards to the Court of Industrial Appeals. Court decrees have sometimes been enforced by criminal processes, but usually the imposition of a fine is the penalty. It is reported that 80 per cent. of such fines are collected. (The employers who at first were opposed have come quite generally to approve this legislation. On the other hand labor has for several years manifested discontent with it, probably because the gains in wages and conditions in recent years have been very small as compared with earlier years. Discontent is especially marked where unions are strongest. It is claimed that these acts have prevented the losses of strikes and lock-outs for both employers and employees; the unnecessary and often cruel sufferings of women and children of strikers; and one of the causes of sickness, crime, and poverty among unskilled workers.)

ARBuckle, JOHN. An American merchant and philanthropist, died March 27, 1912. He was born in Scotland in 1838 and was brought to the United States by his parents when he was still a child. His education was obtained in the public schools of Allegheny, Pa., where his family had settled. In 1871 he removed to New York City, where with his brother, Charles, he established the firm of Arbuckle Brothers. The specialty of the house was at first coffee sold in packages, and a large business was soon built up. Shortly afterwards John Arbuckle conceived the idea of selling sugar in the same manner and entered into an agreement with the late Henry O. Havemeyer by which the latter was to provide sugar. Such a large business was built up by retailing sugar in this manner that the American Sugar Refining Company decided to enter into the business itself and refused to supply it to Mr. Arbuckle. The latter thereupon began refining raw sugar and this precipitated a bitter fight with the sugar trust which continued for many years. In order to injure the Arbuckle coffee business the sugar

trust began selling coffee in packages. In 1901 a compromise was arrived at, and while Mr. Arbuckle remained in the business of selling sugar, the sugar trust gave up the business of selling coffee. He became one of the foremost sugar makers of the United States and was perhaps the best-known coffee merchant engaged in business. In his later years he became much interested in philanthropic work and was particularly interested in making life easier for the working girl. A farm of 800 acres at New Paltz, N. Y., was used to give tired men and women from New York and Brooklyn outdoor work. In addition to his sugar and coffee enterprises he was engaged in the wrecking business and spent many years in working on a system for floating sunken ships. He put into successful operation a scheme for raising sunken vessels and driving out water by compressed air. Among the vessels which he raised by this plan were the United States cruiser *Yankee* and the United States collier *Nero*. John Arbuckle is said to have left a fortune of at least \$20,000,000.

ARCHÆOLOGICAL INSTITUTE OF AMERICA. The annual meeting of this institute was held at Granville, O., December 26-31, 1912. The meeting of the American Philological Association was held in conjunction with it. In his report, President Francis W. Kelsey gave a sketch of the growth of the institute since 1902. He suggested the formation of a Committee on Egyptian Archaeology to coördinate with the existing Committee on Medieval and Renaissance Studies. He also suggested the investigation of the possibility of procuring funds for the establishment of an American school in Peking, and the formation of a committee on museums, consisting of experts who will hold themselves in readiness to render assistance to affiliated societies in this part of their work. The council of the institute took favorable action on all these suggestions. On December 31, the absorption of the School of Classical Studies in Rome with the American Academy became complete and the school passed finally out of its subordinate relation to the institute. The movement to procure endowment for the school in Jerusalem made such progress during the year as to indicate that the institute will be relieved of further expense. During 1912 the demand came to the institute for several series of extension courses of lectures on archæological subjects, and the success of these courses was so great that ten similar courses have been arranged for 1913. Harry L. Wilson, of Johns Hopkins University, was elected president of the institute.

ARCHÆOLOGY. SYRIA AND PALESTINE. To the south of the "Street called Straight" in Damascus a series of streets forming concentric semicircles has been found, which is supposed to have enclosed the site of a theatre of Roman times. The houses within the semicircles are constructed on the top and sides of a great pile of rubbish. Among other discoveries made upon this site is to be mentioned that of a complete piece of the outer wall of an ancient temple. The wall is well preserved throughout its fifty feet of length and varies from twenty-seven to thirty feet in height. An inscription connected with the temple has been recovered; it mentions two men, Menedoros and Zenonos, as stewards of the temple, and is dated in the year 349 A. D. For some

reason the name of Diocletian has been erased from the text of the inscription. Near Marash, in northern Syria, Garstang has discovered a royal monument of the Hittites. This monument is a slab of dolerite 1.20m. in height, by .66m. in breadth, by .34m. in thickness, and it bears upon the face of it in relief a man clad in the Hittite costume and holding a triangular shaped bow against his shoulder. The figure is posed upon the back of an animal with a short tail, while above the figure is a winged rosette, a sign of royal rank. The monument dates in the ninth century B. C. The same scholar, Garstang, has finished his search of the site of Sakhtje Genzi. By using sectional cuttings it has been possible to show that the strata penetrated date from the XVIIIth. to the XXVIth. dynasties of Egypt. This is especially valuable for the determination of Hittite chronology. In the course of the work on this site the temple and several Hittite houses were found.

EGYPT. Work on the great rock-cut temple of Abu-Simbel was brought to a close last season. In the course of clearing away the sand from the front of the entrance a wide terrace was brought to view, whereon was discovered a small temple in which stood an altar having two obelisks in front of it and a shrine beside it. The shrine contained a scarabæus and an ape, while upon the altar were four more apes. Across the whole breadth of the terrace was discovered a row of statues consisting of figures of the pharaoh alternating with those of the sacred hawk of the sun. These statues acting as standards emphasize tremendously the size of the great rock-cut colossi of the façade of the temple. The colossi themselves have been repaired by driving liquid cement into the fissures which time has caused in them.

At Abydos the Egyptian Exploration Fund is continuing its work. At present the Osireion, the underground temple devoted to the mysteries of Osiris, has received the most attention, where the secret entrance to the building is being sought. During the campaign a previously undisturbed tomb was opened. It was built of unbaked bricks and dated from Roman times. In it were twelve sandstone sarcophagi, each containing a mummy with the blue and gold painting upon the wrappings still fresh. In another place was discovered a XIIth. dynasty burial wherein was a woman's skeleton with bracelets of cowry shells and carnelian beads and a ring with five scarabs. Near by lay a silver nose ring, ornaments of shell, glass beads, and copper, and iron rings. In addition to accomplishing this work Naville, who is in charge of the excavations, partially unearthed a mastaba behind the temple of Seti. Its walls, of carefully joined blocks of quartzite, are nearly thirteen feet in thickness, and the structure dates, so the excavator thinks, before the reign of Menaptah, in whose reign it was previously supposed to belong. It is hoped that the building may prove to be the legendary tomb of Osiris.

Some thirty-five miles to the south of Cairo near the village of Tarkhan an extensive cemetery has been discovered dating from the earliest historic period down to the Pyramid period. Although many graves have been destroyed, about 600 have been found extending over an area of a mile in the desert. The cemetery is bound to be, so it is held, one of the standard sources for our knowledge of the early historic

age of Egypt. The date of this most northerly settlement known for this early age is given by a tomb which was found to contain pottery of a pre-Menite king, and by another tomb containing pottery of Narmer-Mena. It is believed that the presence of so large a cemetery, belonging for the most part to a time before the time of Mena, argues that a chief town of this time must have been in the region of the present Kafr Ammar. This town antedated the founding of Memphis and seems to have been settled a few generations before the reign of Menes. If it was founded as the capital of the dynastic race before that of Memphis then it shows a stage in the conquest of the land by the kings of Abydos. Of especial interest is the unusual state of preservation exhibited by the wood and cloth found in the burials. Thus the linen in the earliest tombs was still fresh and strong, and large sheets from XIth. dynasty tombs were as sweet as if just woven; while pieces of wood used in the coffins were still as sound as when buried. The wood employed for this purpose was that which previously had been built into houses, as is shown by the fact that not only were many pierced along the edge so that they might be so lashed together in the dwelling that they might slide past one another when they shrank or expanded, but also by the fact that some were charred on the inside and weathered on the outside as they would have been had an old house been consumed by fire. So remarkable was the preservation of the burials in this cemetery that even the palm fibre and rush webbing of the bed frames were intact. Among the small finds, besides about 300 alabaster vessels and pottery, were four sealings of Narma-Mena, a king hitherto unknown.

At El-Gerzeh a pre-dynastic grave containing iron beads was opened. At Gurna the Germans have located three, and possibly four, chapels belonging to the XXth. or the XXIst. dynasties. Under these was found a building of Thothmes IV. In addition to this a number of tombs were opened in one of which were the sarcophagi of the great grandson and the granddaughter of Takelothis I. The work of the English at Heliopolis has demonstrated that the town had been deserted since the Persian invasion in 525 B. C. Darius evidently destroyed the city since he looked upon it as the key to Memphis. The temple enclosure was found to be three-quarters of a mile in length and surrounded by two walls forty to fifty feet in thickness, dating from the XIXth. dynasty. The great surprise came in the discovery, in the northwest corner, of an earth fortress of the same type as that at Tel el Yehudiyeh (see YEAR BOOK for 1907) which has been attributed by Petrie to the Hyksos invaders. The fort is of the same size and shape here as there, being a rounded square a quarter of a mile across and having a wall over 100 feet in thickness.

Early in the summer of 1912, the palace of Amenhotep III. at Memphis was laid bare. It was then found that the rows of houses in which the officials of the palace lived were inside the palace walls. A number of frescoes were discovered, among which may be mentioned those representing ducks in flight and pigeons rising from marshes of lotus and papyrus. Also at Memphis has been found a huge sphinx of alabaster. The monument lay between the two famous colossi and measured

twenty-six feet in length and fourteen in height. It dates about 1300 B. C. At the northern gate of the temple of Ptah another sphinx of red granite, over eleven feet in length and seven in height, came to light. On it was an inscription of Rameses II. Near by was also found a life-sized, and perfect, group in red granite representing the same king and the god Ptah standing. Deep under the north gate was recovered a lintel of Amenemhat III., which indicates that he was the builder of the gate. Herodotus ascribes the gate to the same king under the Greek name Meris. During the past season a greater part of the Ethiopian city at Meroë has been plotted and excavated. The palace, when excavated, was found to be equipped with a very elaborate system of baths of the plunge variety. The walls were decorated with rows of colored tiles ornamented with reliefs all in place. A small but perfect Roman temple was discovered as well as many statues in a new style of art apparently strongly influenced by Greek art, but marked by African peculiarities. Thus a "Venus" in the attitude of the "Medici" shows marked steatopygy.

Among the papyri discovered at Oxyrhynchus is a fragment of 400 lines from a satyr play by Sophocles. The play, which bears the name of the *Ichneutes*, or the *Trackers*, deals with the exploits of Hermes, namely, his theft of Apollo's cattle and his invention of the lyre.

ASIA MINOR. In the island of Cos two hoards of coins have been discovered, the first comprising twenty-one drachmas dating from the third century B. C., and the second ten copper coins of the same date. At Miletus and Didyma the work is drawing to a close. Remains of a prehistoric settlement have been found on Kilitepe and the Hellenistic wall has been further searched and the general plan of the city made clearer. It is now known that the regular size of a block, or *insula*, was 29 x 55.50m., and the normal width of the streets was from 4.40 to 4.50m. Particularly interesting among the discoveries was that of a fine Corinthian structure in the southern marketplace dedicated to Laodice, who was perhaps the wife of Antiochos II. The work on the baths of Faustina is finished. At Didyma the sacred way and the limits of the ancient town have been examined. More than half of the great temple has now been laid bare. All the columns are standing to the height of several meters. At both sides in the wall of the pronaos low, barrel-vaulted passages lead down to the Adyton, 4.50m. below. At Tchalef, the Hittite capital of the fourteenth century B. C., gigantic foundations, supposed to belong to the palace, have been excavated, and 170 almost perfect reliefs have been recovered. One represented a figure resembling Herakles.

The Americans at Sardis have this year cleared up the temple of Artemis. This meant that in the later part of the work a depth of fifty feet of earth had to be removed. In this part, however, the building was well preserved and presents an imposing appearance. The temple is a little over 100m. long and a little less than 50m. wide. It is octostyle pseudodipteral with twenty columns on the side. The cella contains two rooms of different sizes and on different levels. It is now believed that the east end of the fourth century temple was unfinished when it was so injured that it became necessary to take down most of its columns.

This may have been at the time of the earthquake in the year 17 A. D. Near the temple was found an inscription 138 lines long, containing a letter from Augustus to the people of Sardis. Probably the most important discovery of the year was that of an inscription eight lines in length written in both Aramaic and in Lydian. This document is dated by a year in the reign of Artaxerxes and is almost perfectly preserved. By it a key to the Lydian tongue is afforded. Many tombs were opened this season, but they present no remarkable difference from those of last year.

GREECE. During 1912, most of the excavations on old sites were continued. While the work has been rewarded with valuable results no site except that excavated by the Americans at Sardis has afforded anything of spectacular nature. In Athens the Greek Archæological Society has continued the work in the neighborhood of the Pnyx, and has opened a number of graves of different dates throughout the city. At New Phaleron seventy graves of the archaic period have been opened, and from them pottery of the Phaleron, Corinthian, and so-called Proto-Corinthian styles have been recovered. These graves for the most part were those of children. At Anavysos, near Thorikos, tombs were excavated which contained styles of pottery running from the geometric to the black-figured styles; at Sunium investigation of the rubbish connected with the old temple of Athena has brought to light a number of votive offerings of the archaic period, including a lead figure of Apollo, a marble statuette of the so-called island type, and several scarabs.

From the Greek islands of the Ægean interesting results have been obtained. In Samos excavations have been continued on the site of the Heræum. Since no traces of internal supports were found, the assumption has been made that the building was hypæthral, or open to the sky. Although the temple was in the process of construction throughout the sixth century B. C., it was apparently never brought to completion. The columns were of both marble and poros, and in one case the two materials were so combined that a marble capital was superposed upon a poros shaft. Seventy column bases of the finest type of archaic work, belonging to the pre-Persian building were discovered in the foundations of the later structure. An interesting discovery in the neighborhood of the temple was an hemicycle containing a base of a statue inscribed with the name of M. Tullius Cicero.

Crete continues to offer its quota of material. At Gortyna the circular building into which the famous "Gortyn Code" was built has been cleared enough to prove that the building was an odeum restored by the Emperor Trajan. In the course of the work two new blocks of the inscription have been recovered. Near the basilica the excavators have uncovered a nymphæum which included a fountain of three basins and much sculpture. This building dated from the early imperial times, but continued to stand in place until the seventh century A. D., as is shown by an inscription of that date recording its restoration. The continuation of the work of the Italians at Hagia Triada has resulted in the discovery of an interesting and well-preserved shrine of the "Late Minoan III." period, and a large number of inscribed tablets, mostly accounts. At the same place a prehistoric town has been

brought to light, having in its midst the "Leser Palace." The oldest part of the town was to the west where the houses were located very closely together. In this locality many domestic utensils were recovered. The excavators also uncovered a small temple, which is of peculiar interest owing to the fact that its façade is supported by three columns resembling those shown in the panels at Cnossos. In eastern Crete, at Vrokastro, the Americans have been at work on a part of the geometric hill-town. The burial places revealed three types of interment, rock-cut tholoi, bone-chambers, and rock-shelters. The pottery was strongly reminiscent of the Minoan style, although together with it was found purely geometric ware. The inhabitants practiced both inhumation and cremation. Objects of bronze as well as iron were found in the burials. At Thasos the lower portion of a statue has been found at Osmanieh (Limena) which is of particular interest because it is the work of Philiscus the son of Polycharmus (see Pliny, *N. H.*, XXXVI, 34, 35). The fragment belonged to a statue of Artemis Polo.

In northern Greece, Pagasæ (see YEAR BOOK for 1911) has again proved a profitable site. From one of the southwest towers as many as 230 grave stelæ and fragments (almost all of them painted) have been recovered. One of the paintings represents two men, one standing and one seated, and is considered to be the best yet found on this site. As it will be remembered, this whole series was used in repairing the town wall probably in the year 191 B. C. The stelæ themselves date from the period reaching from the year 350 to circa 250 B. C. The temple of Athena at Gonnus, mentioned last year, has yielded a number of new inscriptions, architectural details, and small objects. At Halos in Phthiotis the English have opened ten cist-graves which contained inhumation burials and geometric pottery similar to that found in the island of Skyros. The largest of the tumuli in the locality when opened was found to contain sixteen burned pyres covered with stones and containing together with burned human remains, geometric pottery, iron swords, knives, spears, and bronze fibulæ, etc. The occurrence of burning and cremation at a distance of only half an hour, both of them in connection with geometric pottery is at present confusing. At Sesklo, in Thessaly, five important geometric graves have been excavated, while at Dranitsa, in Dolopia, the remains of thirty-one bodies were found in a large chamber-tomb of the geometric period.

At Tanagra, in Boeotia, 150 graves dating from the sixth to the first century, B. C., were opened. The oldest graves were found to be pits containing ashes or shafts, containing unburned bones, although pithoi and terra-cotta sarcophagi were also in use in the sixth century. These early graves contained many objects—one grave alone having as many as 175 aryballi in it. The later graves consisted of large tiles, stone slabs and even earthen pipes. At Halæ two members of the American school opened about 200 graves dating from the geometric period down to Roman times. Since the burials have never been disturbed the results are valuable for dating the wares found in the graves. Of particular interest was the discovery of plates decorated with Boeotian geometric designs on a white ground found in connection with a black-figured lekythos. At

Thebes three more rooms in the so-called "Palace of Kadmos" were excavated. One very interesting find in the court was that of a potter's kiln dating from Mycenaean times. The kiln was circular in plan divided vertically by a wall and had a pierced floor of baked earth. At Thespiæ the common grave of those who fell at Delion in 424 has been opened.

Near Elatea upon a rising piece of ground an entire prehistoric village has been uncovered. The site was occupied from remote times. Thus in the lowest stratum the excavators found finely polished stone implements together with articles of bronze, which showed that the period was one of transition from stone to bronze. There is a marked resemblance between these bronzes and those dating from the Early Minoan in Crete. In the next stratum the finds belonged only to the Bronze Age. The Bronze Age period is marked by stone buildings; and among the remains of these numerous fragments of vases were discovered which were originally decorated with a coating of black color on which again geometric designs were executed in white. In the upper stratum were found objects of the same date as the Late Minoan of Crete. At Elasona, in Macedonia, two prehistoric settlements have been found similar to those in Thessaly. In one of these were vases of the so-called Late Minoan II. period.

THE PELOPONNESOS. The Austrians have continued at Palæopolis the work which they inaugurated in 1910. Here two baths and a mausoleum of Roman times have been examined, and graves of Greek, Roman, and Christian times have been opened. It is interesting to note that the only whole inscription in the place to come down intact is one found in connection with a Christian burial and containing a curse. At Agos the foundations of a temple 100 meters long with the base of the cult-statue still in place have been cleared out. An examination of near-by Byzantine walls brought to light pieces of statuary, a score of inscriptions, and over 200 pieces of entablatures from buildings in the market place. At Skala, in the Inachos valley, a Mycenaean cemetery has been found. At Kynouria a small temple to Apollo Tyrifos has been discovered. Two inscriptions on bronze plates making mention of a "temple of the Great God" found on the hill of Palaio-Katuna has led to the belief that this place is the site of Thisoa.

In the Island of Corfu Doerpfeld continues his work referred to in last year's report. The "Gorgon" temple has been further examined and the great altar has been laid bare. In Cephalonia a large number of tombs of Hellenistic date containing vases, coins, and jewelry have been opened.

AFRICA. At Bonah (Hippo), in Tunis, two superposed Roman villas have been excavated. In both the mosaic floors were preserved, in one case to the extent of an area of thirty yards. This one portrays a hunting scene, while another is decorated with a fishing scene. At Mactar, also in Tunis, the remains of three buildings have been brought to light. In one the mosaic floors were preserved in three rooms. From the sunken vessel *Mahdia* more objects have been recovered, including among other things a low relief representing Asklepios and Hygeia, together with a great deal of pottery, and many objects of bronze. These

include a bust of Athena, masks, heads of animals, and household utensils. The finding of human and animal bones shows that the wreck of the vessel was attended by a loss of life.

ITALY. At Ostia work has been carried on industriously since last year. Something over 1600 yards of the "Via Decumana" have been exposed and many of the public buildings of the town have been cleaned out. With the excavation of the intervening spaces, the most important portion of the town is now exposed as a connected whole. In the theatre the excavators have discovered a fine statue of Venus which appears to be a copy of some Hellenistic work. The baths, originally excavated in the year 1888, have been further examined and their beautiful pavements, showing marine subjects in black on white ground, have been laid bare. It is interesting to note in connection with the remark of Clement of Alexander, to the effect that the Romans had the custom of placing a shrine to Fortune in a portion of the house not usually mentioned, that actually in that apartment of the firemen's quarters just such a shrine with an inscription to Fortune was discovered. In connection with the firemen another inscription has been recovered which shows that these men received corn free from the city. In their barracks was found a watering trough for horses. The barracks of the *vigiles* have been completely cleared as well as the area behind the theatre where remains of a Christian church came to light. The palaestra has been examined and the great cisterns beneath it show the excellence of the public buildings. Here also were found five furnaces for heating. The structure had almost perfectly preserved mosaic floors. Since no traces of anything earlier than 266 B. C. have come to light, it is believed that the town was founded at that time. Excavations at San Pietro Montagnon, near Padua, have brought to light strata of pre-Roman remains. These contained objects in bronze, as human figures, horses, rings, etc., together with an enormous number of terra-cotta cups and saucers.

At Pompeii work has been carried on with particularly successful results. The "Street of Abundance" has been shown to have been for the most part a business thoroughfare, for the windows on the ground floor are wide as shop windows should be. Balconies were found to be frequent on this street. The most spectacular of all the finds in this locality was that of a wine shop in just the condition which it presented on the fatal day in the year 79 A. D., when the town was covered by the eruption of Vesuvius. The top of the counter, or bar, is of glazed white tiles and pierced with openings in which rested the wine-jars. In the corner of the shop were amphoræ of various sizes to hold the supply of wines. On the counter rested an ivory, or bone, cash-box still containing gold and silver coins, while near by were scattered copper coins showing how precipitately the place was deserted. Among the finds were a pair of jars in the form of cocks with the beaks serving as spouts, while at the back of the shop was an arrangement used for heating the various drinks served. This heater consisted of a copper boiler which rested over a hole in the masonry and it was supplied with a lid chained to it so that no absent-minded person might mislay it. How sudden must have been the overthrow of the city is shown by the presence of the re-

mains of people, men and women, who were overcome while in the shop. Further evidence of the unexpectedness of the eruption is afforded by the discovery of the fine palace of one Obellius Firmus, for just before the door of the house lay the six bodies of Obellius, his wife, two little children, and two other persons—probably servants. The little children had fallen, clasped in each other's arms, and the parents had met their death clasping each other's hands. A number of frescoes have been uncovered on the walls of various houses. One in particular represents the carrying of the image of Cybele in procession. The goddess is surrounded by worshippers while four men are inserting poles in holes in the stage on which the goddess is placed preparatory to carrying it away. Another fresco shows the unusual scene of a girl being punished. She is represented as kneeling with her face buried in the lap of another female, while a third figure holds a rod over her bared back. On the opposite wall of the room is painted a woman who raises her hand in surprise at the punishment. On the street walls of a number of the houses were found notices referring to politics. The most interesting (at this present time of the suffrage movement) is one dealing with the part played by women in Roman elections. It reads: "Aselinas and Smyrine say 'Vote for Fuscunas as your alderman.'"

Recent excavations for foundations near the Monte Testaccio, in Rome, have brought to light a strong-box which had been destroyed by a fire of such violence that many of the coins in it were fused. Some 770, however, have been identified, and these run from the time of Antonius Pius to that of Gallienus. The ancient buildings cleared by the excavations proved to be granaries. Many pieces of jars and fragments of marble and terra-cotta decorations, together with some inscriptions, have also been recovered.

FRANCE. At Alesia the walls of the fortifications reared by Vercingetorix in his last stand against Cæsar have been excavated. The ramparts were found to be built in alternating sections of earthwork and wooden beams, and the whole structure faced with rough stonework. The wooden beams had decayed, but their locations were clearly marked. The square spikes used in holding the beams in place were found still *in situ*. At Sos (Lot-et-Garonne) excavations have brought to light the remains of a pre-Roman city which was defended by strong ramparts of tremendous blocks of stone. It is believed on the strength of this evidence that this is the town of the Sotiates which so stoutly resisted Cæsar in the year 56 B. C. Subterranean passages and mines synchronous with the Romans agree with Cæsar's description of this town. Digging has also brought to light Latin inscriptions, and tombs from which were recovered a terra-cotta head, some coins of the colony of Nîmes, and a spear head. A portion of a colonnade, probably belonging to a villa, was also found.

GERMANY. Excavations on the site of the Roman fort at Alzey demonstrate that it varies from other forts found in Germany in that it was built of stone instead of wood and earth. Ashes seem to indicate that the fort was destroyed by fire. Its date is given by coins discovered there as probably about 330 A. D. Near Ober-Grombach the foundations

of a country villa of Roman times have been recovered.

ENGLAND. Recent excavations at Chester in the process of extending the infirmary have encountered the cemetery of the XXth. Legion. Some of the graves had Roman roofing-tiles bearing the stamp of the legion. One of the graves contained three urns, in one of which was a metal mirror, which seems to show that the burial was that of a woman. In the course of the excavations bronze coins of the time of Antoninus Pius and of Commodus came to light, together with Roman sandals, tiles, and bottles. At Watergate Hanger, West Marden, a Roman villa has been excavated. In the building was one large room and several small ones, three having tessellated pavements. Near to the villa was uncovered a building which may have been the cottage of some one connected with the estate.

ARCHBALD, ROBERT W. See UNITED STATES, Congress.

ARCHITECTURE. The year 1912 appears, in general, to have been a year of normal architectural activity, unbroken by any widespread disturbance, financial, industrial, or political. The influence of the Tripolitan and Balkan wars has been confined to regions of minor importance architecturally; while in the United States uninterrupted peace and prosperity have completed the final recovery from the "panic" of 1907, and resulted in the production of new buildings exceeding in value those of any year since 1905.

CITY PLANNING. The interest in city planning and its development both as an art and a science has continued unabated on both sides of the Atlantic; congresses have been numerous, the most important of these having been held in October at Düsseldorf, Germany, where competitive designs were exhibited for an extensive replanning of that interesting city. An account of the recent aspects of the subject will be found in the article CITY PLANNING.

REINFORCED CONCRETE. While the use of reinforced concrete or ferro-concrete has been further extended and broadened in engineering works, its strictly architectural applications have generally been confined to the more utilitarian parts of the construction. Massive or monolithic concrete, on account of its unsatisfactory texture and color, has not come into use for the exteriors of monumental buildings, at least to any appreciable extent; but for bridges, viaducts, embankment walls, and many similar purposes in which architecture and engineering play an equal or nearly equal part, it is proving an invaluable material. In the United States also, as to some extent in Europe, concrete has during the past year been widely used in the building of small residences, either in the "massive" or "poured concrete" form, or by the use of concrete blocks molded at the site of the building and laid up as masonry. At Rungis in France, a church was erected by a new process of combining separately cast units of concrete. The new triple-domed Catholic cathedral at St. Louis, Mo., by Barnet, Haynes, and Barnet, was largely constructed of concrete; and at Camden, N. J., the dome of the Linden Baptist church, by Truscott and Moses, was built of slabs of concrete carried by ribs of timber. Concrete also entered largely into the construction of the

handsome new railway station at Leipzig, Germany.

EUROPEAN ARCHITECTURE: ITALY. From a sentimental point of view the most interesting architectural event in Europe was the completion and dedication in April of the historic Campanile of St. Mark's at Venice, whose leisurely but thorough reconstruction has occupied nearly the entire ten years since its fall in 1902. It is a faithful reproduction of the original design. The most difficult detail of the task was the piecing together of the hundreds of fragments of the sculptures of Sansovino (cir. 1530 A. D.) in the Loggetta at the base of the tower; this has been accomplished with remarkable success. Rome witnessed the final completion of the colossal Victor Emanuel monument, which has been in process of construction for thirty years; and which, with the possible exception of the Taj Mahal at Agra, is the most costly monument ever erected to any human being. It is magnificent and yet somewhat disappointing in its lack of unity and concentration of interest.

GERMANY. The architects of Germany appear to have been full of business in 1912. For many important works the architects were selected by competition, a procedure more in favor there than in America. There was observable, as in other recent years, an oscillation of tendencies between the "Moderne Kunst" or "Art Nouveau" style, and a somewhat baroque version of Palladian design. The majority of the churches show a restless striving after novelty, resulting in a very unecclesiastical eccentricity; one of the least bizarre examples was the Protestant Christ Church at Mannheim, a domical edifice in the Baroque style. The majority of the new school buildings, though excellently planned, show the same apparent cult of the ugly, both in mass and detail; a pleasing exception is the new Reformgymnasium at Tempelhof by Köhler and Kranz. In contrast to the schools and churches the theatres and railway stations of the year's product were almost without exception dignified and appropriate in design. Of the former, the most interesting is the municipal theatre group at Stuttgart. This dignified group, on classic lines, comprises a large and a small theatre, with restaurants, offices, rehearsal rooms, etc., admirably combined in a harmonious design by Max Lettmann. Among railway buildings may be mentioned the new station at Leipzig, already referred to, another at Mülheim in Alsace, and the new elevated railway in Hamburg which, with its artistic terminal and way stations, exemplifies the admirable German practice in the artistic treatment of engineering works. Another example of this is seen in the new bridge over the Rhine at Cologne. German civic architecture is illustrated by the new police department buildings by Theo. Fischer, a baroque *Verkehrsministerium* by K. Hocheder, and a new tax office, with ugly roof and dormers, all in Munich. German achievements of the year in this line have been less interesting on the whole than in business buildings, which displayed less of "art nouveau" eccentricity than usual. Among notable examples may be mentioned the Tietz department store (Cremer and Wolfstein) at Berlin, with a fine glass-roofed court, and the Wertheim store on the Königsstrasse by Keyser and Von Grossheim, the new Hahn establishment by W. Schelbach,

and a number of sumptuous restaurant buildings erected by various brewing companies (Pschorrhaus, Berliner Saal, etc)—all these in Berlin; and the Lindwurmhof (a business block), the Gewerbeschau or Industrial Exhibition group, and a large block of municipal tenements around a large court, all at Munich.

From Vienna and Austria in general there is nothing specially calling for mention.

FRANCE. There is little building of great importance to report. A few interesting edifices in Paris deserve mention. The Singer-Polignac tenements by G. Vaudoyer in the 13th *arrondissement* (ward) of Paris, containing 64 apartments of from two to four rooms each, renting from \$45 to \$80 yearly, with many arrangements worthy of study by tenement house reformers in this country; the new Hôpital de la Pitié by J. Rochet; a very extensive and thoroughly modern group of buildings for this great municipal hospital; the extension of the Carnavalet Museum by R. Foucault; and the Apollo Concert Hall in the Rue de Clichy, with a reversible floor on trunnions, which can be turned over to provide at will a clear floor for dancing or a sloping floor with seats for concerts. At Nantes a design by M. Déverin has been adopted for a new Hôtel de Ville to be incorporated with the existing medieval château or castle of that city. The French architectural societies have been earnestly discussing the whole question of officialism in the profession, especially the appointment of government architects, their relation to the non-official ranks of the profession, and the employment and compensation of architects specially employed on government works.

GREAT BRITAIN. There has been the usual architectural activity. The most important event of the year in London was the completion of the great Methodist Memorial Hall in Westminster by Lanchester and Rickards, which has been in course of construction for a number of years, and which was dedicated and opened on October 3. It is a vast and impressive edifice crowned by a square dome of 90 feet span, and containing the central administrative offices of the Wesleyan Methodist body in Great Britain, with a great auditorium, conference rooms, etc. Next to this in importance, possibly surpassing it in the popular interest awakened, has been the publication of Sir Aston Webb's design for a new façade for Buckingham Palace, which has been severely criticised by some and as warmly defended by others. It is at least an improvement over the front as originally erected by Blore in 1837. Another controversy which has divided public opinion both in Liverpool and in the profession at large has been the proposed remodeling of the podium or terrace of St. George's Hall in that city, to provide a setting for a projected monument to Edward VII.

Work has continued on the County Council Hall in London, and on the Aldwych improvements; extensive additions to the Law Courts have been completed, from designs by Sir Henry Tanner; and the first steps taken towards the extension of the Guildhall, although as yet no final design has been adopted. New government offices have been begun at the corner of Great George Street, and a design by T. Edwin Cooper has been selected in a competition for new offices for the Port of London Authority:

an imposing block with a lofty central tower, on an irregular lot. The work on Liverpool Cathedral has been continued, and the restored Winchester Cathedral, substantially completed in 1911, was dedicated with a thanksgiving service on St. Swithin's day, 819 years after its original dedication in 1093. At Cambridge new buildings were completed for the Museum of Archaeology and Ethnology, by T. G. Jackson, and for Queens, Emmanuel, and Sidney-Sussex colleges; at Oxford for Lady Margaret Hall (R. Blomfield), Merton College (B. Champneys), Hertford and Balliol colleges; at Selby Abbey, the new south transept was completed and dedicated (J. Oldred Scott); and at Dublin the competition for new buildings for University College was awarded to Doolin and Butler for an interesting design externally treated in a Greco-Roman or Pompeian style. The great building for the National Museum of Wales at Aberystwyth, by Dunbar Smith and Cecil Brewer, was advanced towards completion, and the Edinburgh College of Art was finished. Various memorials to King Edward VII. have been projected or designed: e. g., by C. L. Lutyens and B. Mackennal for Green Park, London; and one for Edinburgh by Albert Hodge and G. W. Browne. A new church in Brixton, Christ Church, by Beresford Pite—on a conspicuous site, is an extraordinarily incoherent design, which does not atone by picturesqueness for its lack of harmony of mass and line.

THE UNITED STATES. Uninterrupted prosperity is reflected in a general increase in the recorded municipal building permits of the leading cities. Permits for new buildings in Greater New York alone aggregated over \$203,000,000 (estimated cost of buildings) besides those for \$11,000,000 of alterations, a total increase of 15 per cent. over 1911. New York thus stands far and away in the lead of all cities in the world in the number and cost of new buildings. Of the above vast sum \$30,000,000 were for the erection of apartment houses and tenements, and \$60,000,000 for business buildings, offices, "loft buildings," stores, and factories. Over against this advance must be set the retrograde step taken by Congress in the repeal of the Tarsney act, under which, in the past fifteen years, many admirable government buildings have been designed by non-official architects selected by competition. The resignation of the efficient supervising architect of the treasury, a warm advocate of the Tarsney act, followed this repeal.

Tendencies in style have not materially changed. Civic and governmental buildings, and the larger museums and libraries were generally in some version of the classic styles, with a noticeable tendency to the use of colossal colonnades, often carried to an absurdly illogical excess, as in the Normal School at San Diego, Cal., by W. S. Hebbard, and in the topheavy State Education Building by H. F. Hornbostel, recently dedicated at Albany, N. Y. In commercial buildings of the skyscraper type, classic and Gothic models divided the public favor, e. g., the Union Central Building at Cincinnati, with a columnar treatment of the upper part, and the ultra-Gothic Woolworth Building by Cass Gilbert in New York. The latter is the tallest inhabited structure in the world, 756 feet high, with 57 stories; externally of white glazed terra-cotta, and somewhat disap-

pointing in the thinness of its detail and its weakness of silhouette and composition. Western buildings showed more freedom and originality of design, both in large and small buildings. On the Pacific Coast architectural interest centred especially in the two exhibitions projected in connection with the opening of the Panama Canal in 1915; the Panama-Pacific (international) at San Francisco, for which a board of architects was appointed, selected partly from California and partly from the East; and the Panama-California (State) at San Diego. Work on both of these, nominally begun in 1911, was continued during the year. An important competition for a new city hall for San Francisco resulted in the adoption of the design of Bakewell & Brown, of that city, an imposing composition with a fine central dome. The government appointed Mr. A. W. Lord, of New York, architect for the various administrative and other buildings to be erected at Panama and along the canal by the Canal Commission.

It is impossible to mention even a tithe of the interesting and important buildings begun or completed during the past year in the United States. In New York the vast but externally disappointing Grand Central Terminal was well advanced towards completion; the imposing new Municipal Office Building was externally completed; the Woolworth Building, the fine Bankers' Trust Building (Trowbridge & Livingston), and the marble United States Rubber Company Building (Carrère & Hastings) were completed; two huge hotels, the Vanderbilt (Warren & Wetmore) and the McAlpin (F. M. Andrews), were opened, and the fine new Central Library in Brooklyn (R. F. Almirall) begun. Notable buildings in Boston were the great Copley-Plaza Hotel (H. J. Hardenburgh, C. H. Blackall), a new U. S. Customs House (Peabody & Stearns), the Brigham Hospital (Codman & Despradelle), extensive dormitories for Harvard University (Shepley, Rutan & Coolidge), a huge department store by D. H. Burnham, a public causeway over the Charles River dam, and several large banks, clubs, etc., representing all together a cost of between twenty and thirty millions. Among many buildings in Chicago and the Middle West a few were: The Insurance Exchange, by D. H. Burnham, the Gothic North American Building by Holabird & Roche, the Telephone Building by the same, and a number of strongly designed warehouses (by G. C. Nimmons, H. Shaw, etc.), at Chicago; at St. Louis, the new Public Library (Cass Gilbert), and Church of the Ascension by Mariner & La Beume; at Minneapolis, the New Museum and Music Hall (McKim, Mead & White) was begun, and a high school by C. H. Johnston completed; at Pittsburgh progress was made on the Western Pennsylvania University buildings and those for the Carnegie Technical Schools. From the further West: The L. C. Smith Building at Seattle by Gaggin & Gaggin, 34 stories high; at Tacoma, Wash., the N. Pacific R. R. station by Reed & Stem and the Woodmen of the World Building (Holabird & Roche); at San Francisco, St. Ignatius R. C. Church by J. I. Devlin, the Union Savings Bank by Bliss & Faville, and many business buildings. Many interesting buildings in the compiler's list, at Washington, D. C., Buffalo, Baltimore, Cleve-

land, Montreal, Toronto, and other cities must be omitted for lack of space.

OTHER COUNTRIES. In Haarlem, Holland, a very impressive and interesting church, St. Bavon's, has been completed (J. T. J. Cuypers), and at Amsterdam a new Exchange by H. P. Berlage. Competitions have been held or announced for a senate palace at Bucharest (Rumania), for a palace of justice at Athens, and for law courts and a royal palace at Sofia (Bulgaria), and for a new municipal palace at Rangoon (Burma). At Ghent (Belgium) a splendid new railroad station has been completed and buildings begun for a great exhibition to be held in 1913. At Constantinople a new bridge over the Golden Horn has been built by German engineers. In India (and in Great Britain) the approaching transfer of the capital to Delhi has aroused earnest discussion as to the style of the new buildings and the planning of the new capital district. South Africa reports continued building activity; a design was adopted for the Rhodes Memorial at Cape Town, by H. Baker; Johannesburg is being transformed by new structures, and a new registration act was in process of drafting for the regulation of the practice of architecture.

For the necrology of architects see **NECROLOGY**. Consult also **ARCHÆOLOGY**, **CITY PLANNING**, and **MUNICIPAL GOVERNMENT**.

ARCTIC EXPLORATIONS. See **POLAR EXPLORATION**.

ARGENTINA. A South American federal republic. Capital, Buenos Ayres.

AREA AND POPULATION. The republic consists of fourteen provinces, ten territories, and the federal district. The area, according to the most recent planimetric calculation, is 2,806,400 square kilometers (1,083,551 square miles). The census of 1895 showed 3,954,911 inhabitants (exclusive of an estimated 90,000 not enumerated). The estimate of December 31, 1910, was 7,121,822 (including some 30,000 uncivilized Indians). Outside of the federal district (city of Buenos Ayres), the population had the greatest density in the province of Tucumán, 13 per square kilometer; Santa Fé, 7; Buenos Ayres (province) and Entre Rios, each 6; Corrientes, 4.7. Estimated population of the larger cities: In 1912, Buenos Ayres, 1,383,663; Santa Fé, 48,928; in 1911, Rosario, 208,990; in 1910, La Plata, 95,000; Cordoba, 95,000; Avellaneda, 87,000; Tucumán, 66,000; Mendoza, 39,000.

IMMIGRATION AND EMIGRATION. 1909, 278,148 and 137,508; 1910, 289,640 and 97,854; 1911, 225,772 and 120,709. The immigrants in 1911 included 118,723 Spaniards, 58,185 Italians, 13,605 Turks, 9713 Russians, 4016 French, 5023 Austro-Hungarians, 3593 Germans, and 1730 British.

EDUCATION. Of the children of school age in 1911, about 45 per cent. were reported in attendance, and of these only about 13 per cent. could read and write. Of the total population over six years old, about 50 per cent. are illiterate. For 1911, primary schools (public and private) were reported at 7183, with 22,456 teachers and 746,725 pupils. The government maintains for secondary education 27 national colleges (10,227 students). Normal schools number 62 (5954 students). There are some 20 schools for special and technical instruction. For higher and professional education, three na-

tional universities are maintained at Buenos Ayres, Cordoba, and La Plata, and provincial universities at Paraná and Santa Fé (total 438 professors and 7317 students). The 1911 government expenditure on education was 19,241,252 pesos

INDUSTRIES. Agriculture and stock-raising continue to be Argentina's chief source of wealth. Mining has made little progress. The leading industrial business is meat-packing, in the River Platte region. Manufactures include flour, butter, cheese, sugar, beer, and wine. The area under cultivation in 1909-10 was about 19,500,000 hectares, of which 5,836,500 were wheat, 3,005,000 corn, 1,455,600 linseed, 4,706,530 alfalfa, 572,000 oats, about 2,100,000 cultivated grass. Other crops include grapes, sugar-cane, barley, potatoes, millet, and beans. Area of wheat harvested in 1910-11, 4,953,000 hectares, yielding 39,730,000 metric quintals (8 qs. per ha.); under crop in 1911-12, 6,897,000 hectares, with estimated yield of 46,109,000 quintals (6.7 qs. per ha.). Area of oats harvested in 1910-11, 650,000 hectares, yielding 6,850,000 quintals (10.5 qs. per ha.); under crop in 1911-12, 1,031,000 hectares, with estimated yield of 8,773,000 quintals (8.5 qs. per ha.). Estimated area sown for 1912-13: Wheat, 6,868,000 hectares; oats, 1,190,000; flax, 1,745,000 (against 1,630,000 in 1911-12). The estimated production of raw sugar for 1912-13 was 1,430,000 quintals, against 1,801,000 in the previous year. See **IRRIGATION**.

Livestock (1910): 29,124,229 cattle, 7,537,765 horses, 750,167 mules and asses, 67,383,952 sheep, 3,946,750 goats, and 1,404,281 swine. As a sheep-raising country, Argentina ranks second, Australia being first, with (in 1910), 92,047,015; Russia had (in 1909) 62,371,579, including goats; United States (1909), 57,216,000; United Kingdom (1911), 30,479,807; Uruguay (1908), 26,286,296.

COMMERCE. Imports and exports, exclusive of corn and bullion, have been valued as follows, in gold pesos (one peso=96.447 cents):

	1901	1906	1909	1910	1911
Imports.	113,960	269,971	302,756	351,771	366,811
Exports.	167,716	292,264	397,351	372,626	324,698

In 1909 coin and bullion amounting to 67,454,000 pesos were imported and 1,247,000 exported; in 1910, 37,028,000 and 1,670,000; in 1911, 12,764,000 and 3,009,000. Leading classified imports in 1910 and 1911, in thousands of pesos: Textiles and manufactures, 68,365 and 69,698; iron and steel and manufactures, 43,119 and 43,086; vehicles and railway equipment, 35,095 and 36,865; building materials, 29,237 and 33,789; earthenware, earthenware, stones, coal, etc., 30,926 and 33,202; food products, 27,141 and 29,337; oil, grease, etc., 13,892 and 15,890; metals and manufactures (other than iron and steel), 12,870 and 15,480; wines, liquors, and other beverages, 14,951 and 13,799; agricultural implements and machinery, 18,922 and 13,692; chemicals, drugs, etc., 12,290 and 12,178; timber, woods, straw, and manufactures, 8671 and 10,401; paper and manufactures, 8308 and 8670; electrical apparatus, 5742 and 6684; tobacco, 6082 and 5892. The textile import in 1911 was subdivided: Cotton, 35,576; wool, 14,249; silk, 5865; other, 14,007. Iron and steel: Primary and relatively primary material, 22,885; manufactures, 20,200.

Argentine exports are classified under six heads, as follows (in thousands of pesos):

	1909	1910	1911
Agricultural products.....	230,504	196,582	139,764
Pastoral products.....	153,548	161,007	168,395
Forest products.....	8,927	10,565	12,255
Fish and game.....	752	1,429	1,663
Mineral products.....	743	540	565
Miscellaneous	2,876	2,505	2,055
Total	397,351	372,626	324,698

Classified agricultural exports in 1910 and 1911, in thousands of pesos: Raw products, 186,317 and 129,711; elaborated products, 5109 and 4927; by-products, 5155 and 5225;—Pastoral exports: ordinary animal products, 135,033 and 137,383; elaborated products, 18,286 and 17,640; live animals, 5056 and 9460; by-products, 2631 and 3911. Leading exports, in thousands of pesos:

	1900	1909	1910	1911
Wheat	48,628	106,039	72,202	80,675
Wool	27,992	59,921	58,848	50,494
Cowhides	13,445	28,978	30,711	34,440
Linseed	10,674	43,713	44,604	33,580
Frozen and chilled beef	2,459	21,066	25,371	31,284
Rendered tallow and grease.....	9,537	11,768
Oats	8,143	11,666
Sheepskins	7,473	8,484	8,567	7,761
Quebracho:				
Logs	2,398	4,380	5,604	6,897
Extract	598	4,226	4,429	4,980
Frozen mutton.....	4,513	5,320	6,008	6,873
Wheat flour	1,718	5,595	4,947	4,739
Bran	1,163	4,483	4,522	4,612
Corn	11,934	58,374	60,261	2,767
Jerked beef	1,980	1,325	1,033	1,662
Bristles	1,335	1,581
Canned meat	1,208	1,541
Whale oil	889	1,206
Meat extract	230	2,892	3,047	1,031

The most noteworthy features of the above figures for 1911, as compared with 1910, are the decline of wool exports by 8,354,000 pesos and of corn by 57,494. Trade by countries, in thousands of pesos:

Countries	Imports		Exports	
	1910	1911	1910	1911
Great Britain..	109,377	108,637	80,792	91,841
Germany	61,129	65,862	45,055	43,073
United States..	48,419	52,353	25,324	24,300
France	33,651	38,027	37,762	39,692
Italy	31,776	29,346	10,475	13,587
Belgium	19,599	19,485	30,481	35,626
Spain	10,911	11,279	2,870	2,178
Brazil	9,104	8,461	17,542	17,874
Austria-Hung'y	3,466	4,304	1,868	2,398
Uruguay	2,262	3,070	1,534	2,341
Netherlands ..	2,517	2,978	4,301	6,440
For orders.....	103,783	36,367
Total, including other..	351,771	366,811	372,626	324,698

The exports "for orders" are not recorded at the Argentine ports as for specific countries, but are subject to cable or other orders as to final destination. Nearly all of these shipments ultimately reach the western European countries and in about the same proportion as the direct shipments given above.

SHIPPING. Entered at the ports in 1910: 31,701 steamers, of 20,351,382 tons, 30,868 sail, of 2,260,515 tons; total, 62,569 vessels, of 22,557,897 tons. Merchant marine in 1911: 161 steamers, of 80,447 tons net, and 185 sail, of 57,350 tons net.

COMMUNICATIONS. A creditable development is observed in Argentina's railways. At the end of 1909 the total length in operation was 25,181 kilometers; 1910, 28,636; and on December 31, 1911, 31,799 kilometers (19,769 miles). About 5360 kilometers belong to the government. At the beginning of 1912 Argentina had a mileage of 10,820 of 5 ft. 6 in. gauge, 1426 miles of 4 ft. 8½ in. gauge and 5736 miles of the meter gauge, giving a total mileage of nearly 18,000. The Buenos Ayres Great Southern operated 3384 miles of this amount, and in 1912 had 309 miles under construction, including the extension of the Neuquén line towards the Andes, leaving about 70 miles to complete to the Chilean frontier. The Great Southern was active during the year, extending and improving its track in and about the city of Buenos Ayres. The Buenos Ayres and Pacific Railway opened during the year a direct line from Justo Darcet, in the province of San Luis, to La Paz, in the province of Mendoza, shortening the trans-Andean route. Telegraphs (1910), 61,005 kilometers of line, with 161,476 kilometers of wire and 2825 offices; telephones, 33,400, with 94,300 kilometers of wire; post offices, 2995.

FINANCE. The unit of value is the gold peso, worth 96.5 cents; the paper peso, under the conversion law of 1899, is current at 0.44 of the gold peso. Revenue increased from 205,341,838 pesos paper in 1905 (gold revenue being reduced to paper) to 254,232,013 in 1908, 274,626,578 in 1909, and 304,679,200 in 1910. The budget for 1912 showed estimated receipts 89,281,681 pesos gold and 128,751,718 paper, equivalent to 331,664,629 pesos paper; estimated expenditure, 29,909,343 pesos gold and 248,764,942 paper, or 316,740,722 paper. The estimated receipts included: Customs, 79,200,000 gold; port dues, etc., 8,750,000 gold; excise, 57,780,000 paper; posts and telegraphs, 16,500,000 paper, stamps, 16,500,000 paper; public works, 10,700,000 paper. Estimated expenditure for 1912, compared with the estimates submitted to the Congress for 1913: Congress, 5,178,580 and 5,178,580 pesos paper; interior, 45,588,047 and 45,066,287; foreign affairs 5,089,472 and 5,028,308; finance, 19,703,218 and 21,073,964; public debt, 76,608,169 and 79,446,194; justice and instruction, 53,079,657 and 49,800,000; war, 29,123,262 and 29,123,262; marine, 28,227,400 and 26,358,076; agriculture, 15,291,156 and 15,700,598; public works, 8339,760 and 8,754,360; pensions, 12,512,000 and 12,512,000; military acquisitions, 18,000,000 and 10,300,000; total, 316,740,722 and 308,741,629.

Debt, December 31, 1911: Foreign, 303,719,786 pesos gold; interior, 161,367,000 gold and 139,656,940 paper; floating, 34,064,123 paper. Outstanding paper money, 685,150,000 pesos.

ARMY. The army of Argentina is recruited by compulsory service which under the statutes of 1905 and 1907 require personal service between the ages of 20 and 45; 10 years in the standing army and its reserve; 10 years in the national guard and 5 years in the territorial forces. A peace strength of about 18,000 is maintained, but in 1912 the peace establishments of the standing army and its departments were published, showing that 15,540 conscripts were required for 1912, or a decrease of about 3000 as compared with 1911. On a war basis about 250,000 men would be raised by utilizing the reserves and the national guard, of which, however, but a fraction have received military

training. The active army was organized into 18 battalions of infantry, including two of mounted infantry, 10 regiments of cavalry, 5 regiments of field artillery, 3 regiments of mountain artillery and 4 battalions of engineers.

NAVY. The Argentine programme of naval construction provides for two large battleships and twelve destroyers and authorizes the construction of a third large battleship and four additional destroyers if it should be needed as a setoff to Brazilian naval development. The new battleships, the *Rivadavia* and the *Moreno*, each of 28,000 tons, were launched in 1911, the former at Quincy, Mass., on August 26, and the latter at Camden, N. J., on September 23. Neither was completed near the close of 1912. Orders also were placed for the twelve destroyers, four each in Germany, France, and England. The German boats were completed in 1912 and joined the Argentine fleet; the French boats were under trial; the English boats were completed, but in October were sold by their builders to the Greek government, without being turned over to Argentina.

Near the end of 1912 the fleet in commission included the following: Four armored cruisers, of 27,400 aggregate tons (*Garibaldi*, *San Martín*, *General Belgrano*, and *Pueyrredón*, built in 1896-98); two armored coast-guards, of 4600 tons (1890 and 1891); one coast-guard, of 4200 tons (*Almirante Brown*, 1880); two coast-guards, of 3070 tons (1874 and 1875); three protected cruisers, of 11,440 tons (*Veinte y cinco de Mayo*, *Nueva de Julio*, and *Buenos Aires*, 1890-95); two torpedo cruisers, of 1776 tons (1890 and 1893); two armored river gunboats, of 2000 tons (*Rosario* and *Paraná*, 1908); seven torpedo-boat destroyers, of 5000 tons (*Misiones*, *Corrientes*, and *Entre Ríos* 1896; *Jujuy*, *La Plata*, *Córdoba*, and *Catamarca*, 1912); 12 first-class torpedo boats, of 969 tons; 9 second-class torpedo boats, of 144 tons; one submarine; six transports, of 29,243 tons. See NAVAL PROGRESS, and BATTLESHIPS.

GOVERNMENT. Argentina (officially *La Nación Argentina*), is one of the five American republics having the federal form of government; the others are the United States, Mexico, Venezuela, and Brazil. The Argentine constitution resembles that of the United States. The Senate has 30 members, elected indirectly for nine years, two from each province and the Federal District; the Chamber of Deputies, 120 members, elected by direct vote for four years. The president is chosen by an electoral college for a six-year term and is ineligible for the next term. He is assisted by a responsible ministry of eight members. President, for the term ending October 12, 1916, Roque Sáenz Peña; vice-president, Victorino de la Plaza.

HISTORY. The difficulty which had arisen with Italy in 1911, over questions of quarantine regulations, and which caused the Italian government to issue a decree prohibiting Italian emigration to Argentina, was removed in the summer of 1912 by the signing of a sanitary convention between the two countries, specifying the preventive measures which each should take against cholera and yellow fever respectively. The Italian government then announced that it would withdraw its decree as to emigration. During January and February the country was disturbed by a serious railway strike, but order was maintained and a settle-

ment finally effected. Work on the survey of the Chilean-Argentine boundary was continued and substantial progress was made in the delimitation of the Bolivian-Argentine frontier.

ARID LANDS. See IRRIGATION.

ARIZONA. POPULATION. According to the Census Bureau statistics issued in 1912, out of the total population of 204,254 in 1910, 46,824 were foreign-born whites, as compared with 22,395 in 1900. The largest number of these, 29,438, came from Mexico; from England, 3500; and from other European countries in smaller numbers. In 1910, there were 2009 negroes and 448 mulattoes in the State. In 1890 the negroes numbered 1357 and the mulattoes, 425.

AGRICULTURE. The acreage, value and production of the principal crops in 1911-12 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	16,000	528,000	\$528,000
	1911	15,000	495,000	480,000
Wheat	1912	23,000	707,000	778,000
	1911	27,000	800,000	760,000
Oats	1912	6,000	268,000	188,000
	1911	6,000	252,000	151,000
Potatoes	1912	1,000	125,000	156,000
	1911	1,000	95,000	133,000
Hay	1912	113,000	a 384,000	4,608,000
	1911	130,000	a 502,000	6,024,000
a Tons.				

MINERAL PRODUCTION. The gold production of the State in 1911, was valued at \$3,430,503, compared with a value of \$3,149,366 in 1910. The output of 1911 was the largest of recent years and the increase was due chiefly to increased output from siliceous gold ores in Mohave county and from copper ores in Cochise county. The output of silver in the State in 1911 was 3,276,571 fine ounces, compared with 2,556,528 ounces in 1910. Of the total silver output in 1911, copper ores supplied 2,136,121 ounces; lead ores, 635,363 ounces, dry or siliceous ores, 414,981; and the lead-zinc and zinc ores nearly equal parts of the bulk of the small remainder.

The production of copper in the State for 1911, was 303,202,532 pounds of blister copper, compared with 297,250,538 pounds in 1910. This was the largest output in the history of the State and continued Arizona in the first place among copper-producing States. At the close of 1911 the copper output was 3,494,333,111 pounds or 21.38 per cent. of the total output of the country, thus giving Arizona third rank among the copper-producing States. There were nine copper-smelting plants in operation during the year.

MANUFACTURES. The Thirteenth Census included statistics relating to the manufactures of the State, and its principal results are given in the table below. These figures are for the calendar year 1909. In general, this table brings out the fact that the manufacturing industries of Arizona, as a whole, showed a considerable development in the last five years. The percentage of increase, as will be seen, is 84. Of the persons engaged in manufactures, by far the larger number are found employed, in the smelting and refining of copper, which is the leading manufacturing industry of the State. In this are employed 3129 wage earners. No other industry employs any considerable number of men except those engaged in work for railroad companies in general shop construction of cars and repairs. These num-

ber 1089. In lumber and timber products 831 men were employed, and in printing and publishing, 268. Other industries of the State are flour mills and grist mills, lumber and timber products, and ice manufacture. Of the total number of persons employed in the various industries, 5.9 per cent. were proprietors and officials, 4.6 per cent. clerks, and 89.4 per cent. wage earners.

The following table gives a summary of the results of the census for the calendar years 1909 and 1904.

	Number or Amount 1909	1904
Number of establishments.	311	169
Persons engaged in manufactures	7,202	5,217
Proprietors and firm members	261	133
Salaried employees	500	291
Wage earners (average number)	6,441	4,793
Primary horsepower	39,140	21,412
Capital	\$32,873,000	\$14,396,000
Expenses	41,131,000	20,244,000
Services	6,303,000	4,441,000
Salaries	798,000	472,000
Wages	5,505,000	3,969,000
Materials	33,600,000	14,595,000
Miscellaneous	1,223,000	1,208,000
Value of products	50,267,000	23,083,000
Value added by manufacture (value of products less cost of material) ..	16,657,000	13,488,000

FINANCE. The receipts for the fiscal year ended June 30, 1912, amounted to \$1,192,350, and the disbursements to \$1,300,858. There was a balance on hand on June 30, 1911, of \$519,959, leaving a balance at the end of the fiscal year, 1912, of \$411,441. The chief revenue was from taxes, and the total amount collected by taxation in 1912 was \$617,731. The chief expenditures are for the support of State institutions, for education and for the State government. The bonded indebtedness of the State at the end of the fiscal year was \$946,672.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions of the State with their populations in 1912 are as follows: State Prison at Florence, 383; State Industrial School at Benson, 96; State Insane Asylum at Phoenix, 270; Home for Aged and Infirm Arizona Pioneers at Prescott, 33; the Florence Crittendon Home at Phoenix, 6. At the State Prison a new building was in process of construction. This is to provide for a library, schoolroom, recreation room, and store-room. The State Industrial School is to be removed to Old Fort Grant near Willcox which was donated to the State by the United States government. The school work is to be reorganized and a trades school added. Several important measures were enacted at the legislative session of 1912. Among those was a child labor law in a form approved by the National Child Labor Committee. A parole law was also passed. This provided for an indeterminate sentence and for a board of commissioners of paroled prisoners. An act was passed making it a felony for a parent to fail to provide his or her minor child with necessities and making it a felony for a husband to abandon his wife or to fail to provide for her. Another measure provided for the commitment of destitute, homeless, and depraved women, and neglected, abandoned, and homeless children to the Florence Crittendon Home at Phoenix. A measure was passed providing for

the care, maintenance, and instruction of blind children under school age.

POLITICS AND GOVERNMENT. The State legislature met in 1912 and the most important measures enacted are noted in the paragraph *Legislation* below.

Arizona became formally one of the States of the Union on February 14, when the President signed the proclamation of admission. On the same day George W. H. Hunt was inaugurated as governor. In his first message to the legislature he urged an amendment to the State constitution, providing for the recall of judicial officers. This was the provision in the constitution of the State as originally prepared, which led to its veto by President Taft. An amended constitution which left out this provision was passed by Congress and accepted by the President. The legislature passed this measure, it was signed by the governor, and was adopted by the people on November 5. On March 26 the legislature elected as United States Senators from Arizona Marcus A. Smith, Democrat, and Henry F. Ashurst, Democrat. They had been previously chosen at the primary election. Arizona furnished one of the most important of the disputed cases before the Democratic national committee at the national convention. This contest turned on the outcome of the election held in Maricopa and Cochise counties. Its details are discussed from the standpoint of both the contesting parties in the article **PRESIDENTIAL CAMPAIGN**. The disputed delegates were awarded to President Taft. The delegates elected at the Democratic State convention were pledged to Governor Wilson. The result of the vote for President on November 9 was as follows: Wilson, 10,324; Roosevelt, 6949; Taft, 3021. An amendment providing for woman suffrage was carried at this election.

A movement was undertaken in October to invoke the recall against Governor Hunt as a result of dissatisfaction with his prison reform policies. He advocated the honor system and a liberal use of the executive parole and he met with great opposition which resulted in an attempt to bring about his recall. Petitions to this effect were circulated throughout the State, but the movement came to nothing. Petitions were also circulated to bring about the recall of State Senators M. G. Cuniff and Homer Wood in Yavapai County. Mr. Cuniff was president of the Senate. These senators were attacked because of their opposition to woman suffrage and several other measures which were considered at the session of the legislature.

LEGISLATION. The first session of the State legislature passed several measures of unusual importance. Among these was the creation of a tax commission; an act fixing eight hours of labor for miners, hoisting engineers and smelting men; an act regulating child labor; an act providing for indeterminate prison sentences, and an act prohibiting the employment of teachers in the public schools, who were suffering from tuberculosis. At a special session of the legislature other measures of importance were passed. These included a white-slave act; an act denying corporations the right to contribute in political campaigns; an act denying State officials the right to use, and the railroads the right to issue, passes; an act known as the three-cent fare bill, regulating the transport of passengers by common carriers; a compulsory workmen's compensation act (see **EM-**

PLOYERS' LIABILITY), an act providing for an inheritance tax; a pure-food act; an act providing for publicity of campaign expenditures before and after election; a general registration act, and a primary law for elections.

STATE GOVERNMENT. Governor, George W. P. Hunt; secretary of State and lieutenant-governor, Sidney P. Osborn; treasurer, David Johnson; auditor, J. C. Callaghan; adjutant-general, Charles Harris; attorney-general, George P. Bullard; superintendent of education, C. O. Case; commissioner of insurance, Sidney P. Osborn—all Democrats.

JUDICIARY. Supreme Court—Chief justice, Alfred Franklin; associate justices, D. L. Cunningham, Henry D. Ross; clerk, J. P. Dillon—all Democrats.

STATE LEGISLATURE, 1913. Senate, Democrats, 19; Republicans, 4; House, Democrats, 31; Republicans, 4; joint ballot, Democrats, 50; Republicans, 8. Democratic majority, Senate, 15; House, 27; joint ballot, 42.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES. See also **EXPLORATION**.

ARKANSAS. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population in 1910 of 1,574,449, the foreign-born whites numbered 16,909, compared with 14,186 in 1900. Of these, the largest number, 5813, came from Germany; from Italy, 1699; from England, 1517; and from Ireland, 1077. Other European countries were represented by smaller numbers. There were in 1910 442,891 negroes in the State and 81,371 mulattoes. The negroes in 1890 numbered 309,117 and the mulattoes 39,630.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911-12 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	2,475,000	50,490,000	\$33,828,000
	1911	2,390,000	49,712,000	35,793,000
Wheat	1912	94,000	940,000	884,000
	1911	96,000	1,008,000	907,000
Oats	1912	175,000	3,482,000	1,741,000
	1911	205,000	4,100,000	2,173,000
Rye	1912	1,000	10,000	10,000
	1911	1,000	10,000	9,000
Rice	1912	90,800	3,405,000	3,201,000
	1911	71,600	2,792,000	2,289,000
Potatoes	1912	25,000	1,750,000	1,610,000
	1911	28,000	1,430,000	1,644,000
Hay	1912	286,000	a 352,000	4,224,000
	1911	200,000	a 230,000	2,990,000
Tobacco	1912	800	b 520,000	94,000
	1911	800	b 480,000	57,000
Cotton	1912	746,802
	1911	c 915,000

a Tons. b Pounds. c Bales.

The Thirteenth Census statistics of agriculture, dated April 15, 1910, were published in 1912. According to these figures the number of all farms in the State in 1910 was 214,678, compared with 178,694 in 1900. The land in farms was 17,416,075 acres, a gain of about 1,000,000 acres in the decade. The improved land in farms was 8,076,254 acres, compared with 6,953,735 acres in 1900. The average acres per farm was 81.1, compared with 93.1 in 1900. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$400,089,303, compared with \$181,416,001 in 1900. The average value of all property per farm was \$1864, compared with \$1015 in 1900. The average value of land per acre in 1910 was \$14.13, compared with \$6.92 in 1900. The

farms operated by owners and managers numbered 107,412 and those operated by tenants, 107,266. Of the farms operated by owners and managers, 82,321 were free from mortgage and 22,374 were mortgaged. The native white farmers numbered 148,627; foreign-born whites, 2478; and negro and other non-whites, 63,593. The total value of domestic animals, poultry, and bees was \$74,058,292, compared with \$37,483,771 in 1900. The cattle numbered 1,028,071, valued at \$15,460,666; horses and colts, 254,716, valued at \$23,152,209; mules, 222,200, valued at \$27,128,027; swine, 1,518,947, valued at \$5,170,924; sheep and mules, 144,189, valued at \$327,984. Poultry of all kinds numbered 5,788,570, valued at \$2,063,432.

MINERAL PRODUCTION. The production of coal in the State in 1911 amounted to 2,106,789 short tons, valued at \$3,396,849. This shows an increase over the output of 1910 of 200,831 short tons in quantity and \$417,636 in value. It was, however, 270,000 tons less than the output of 1909, and nearly 570,000 tons less than that of 1907. The increase was caused chiefly by the competition of fuel oil and natural gas and of the more cheaply mined coals of other States.

In 1911 there were produced in the State 664 short tons of zinc, valued at \$75,696, and 64 short tons of lead, valued at \$5760.

MANUFACTURES. The Thirteenth Census statistics for the calendar year 1909 were compiled in 1912. A summary of the results of this census is shown below.

Of the 2925 manufacturing establishments in the State, the largest proportion is included in those concerned with the manufacture of lumber and timber products. There were of these in 1909, 1697 establishments. No other manufacturing industry approaches this in number of establishments. The printing and publishing industry includes 295 plants, bread and other bakery products, 133, and flour and gristmill products, 113. The number of persons engaged in manufactures in the State at the time of this census was 44,457 over the age of 16, and 525 under that age. The male employees numbered 43,793, and female, 694. The prevailing hours of labor in all industries were 60 per week, 15.5 per cent. of the total number of employees being employed in establishments where the hours are less than 60 a week, and only 6.8 in those where they were more. Although Arkansas is not one of the leading States in value of its manufactures, the following table shows considerable increase over the figures of the previous census:

	Number or Amount 1909	1904	of Inc. 1904-09
Number of establishments	2,925	1,907	53.4
Persons engaged in manufactures ...	51,730	37,557	37.7
Proprietors and firm members	3,455	2,140	61.4
Salaried employees.	3,293	2,328	41.5
Wage earners (average number).....	44,982	33,089	35.9
Primary horsepower.	173,088	109,509	58.1
Capital	\$70,174,000	\$46,306,000	51.5
Expenses	64,830,000	45,301,000	43.1
Services	22,574,000	16,854,000	33.9
Salaries	3,461,000	2,310,000	49.8
Wages	19,113,000	14,544,000	31.4
Materials	34,935,000	21,799,000	60.3
Miscellaneous	7,321,000	6,648,000	10.1
Value of products...	74,916,000	53,865,000	39.1
Value of products less cost of material.	39,981,000	32,066,000	24.7

EDUCATION. The total school population of the State, ages 6 to 21 years, on June 30, 1912, was 603,226. Of these 427,723 were white and 175,503 were colored. There were enrolled in the public schools of the State 409,756 children, of whom 300,015 were white and 109,731 were colored. The average daily attendance in the public schools was 261,747. The number of teachers employed was 10,175. Of these 8227 were white and 1948 were colored. During 1912 282 new schoolhouses were erected at a total value of \$1,014,109. The total number of schoolhouses in the State at the end of the year was 6333 and the total value of school property was \$10,131,828. The expenditures for the maintenance of schools during the year was \$3,837,549. There were 93 State high schools in 1911-12 and 60 unaided high schools. The total enrollment in the high schools was 9622. The development of the public school system of the State during the last few years has been remarkable. In 1900 the value of all school property was approximately \$2,500,000, and in 1912 more than \$10,000,000. In the twelve years since 1900 the school population has increased more than 118,000, or nearly 25 per cent., and the annual school revenues have nearly trebled in value. The number of teachers employed has increased from less than 7000 to more than 10,000. The legislature of 1911 passed several important enactments relating to education. Among these was the creation of a State board of education with general administrative powers, an act making possible State aid to high schools and an act providing liberal appropriations for the maintenance of the State University, State Normal School, the four Agricultural schools, and the Deaf Mute and Blind schools.

FINANCE. The receipts for the fiscal years 1911-12 were \$6,899,247 and the expenditures were \$6,734,915. The balance on hand at the end of the fiscal year was \$800,770. The chief source of income of the State is the direct tax on all property. The chief expenditures are for schools and charitable institutions. The State debt amounts to \$1,250,500.

POLITICS AND GOVERNMENT. On March 27, 1912, a Democratic primary election for State officers was held, resulting in the defeat of George W. Donaghey by Congressman Joe T. Robinson. It is customary in Arkansas to give an official a second term, and generally he gets it without opposition. Governor Donaghey was running for a third term as governor. The only man who has succeeded in being elected governor of Arkansas three times was the late United States Senator Jeff Davis. The nomination in the Democratic primary in Arkansas is paramount to election.

All except two of the delegates to the national Republican convention were pledged to President Taft. There was a contest in the State which was taken up by the national committee. The contest hinged upon the methods used in the election of delegates at the district and State conventions. The Roosevelt delegates declared they had been excluded from the convention halls and from participation in the convention. After hearing the contest the national committee gave the delegates to President Taft.

The Democratic State convention on April 12 selected delegates pledged to Champ Clark of Missouri to the Democratic national convention.

The State elections in Arkansas are held on

the second Tuesday in September, instead of the same day as the presidential elections, as is the case in most of the other States. The State is always Democratic by a large majority and in this election the Democratic candidate for governor, Congressman Joe T. Robinson, was elected by a plurality of 63,386 over Roland, his Republican opponent. The vote was: Robinson, 109,826; Roland, 46,240, and Mikel (Socialist), 13,384. The Progressive party had no candidate for governor. Under the initiative and referendum amendment the people in the general State election of September 9 voted on four acts and five amendments to the constitution. These were Act No. 1, to reduce the rate of taxation and revise the revenue laws; Act No. 2, to provide State-wide Prohibition; Act No. 3, to amend the election laws of the State; Act No. 4, to create a textbook commission; amendment No. 11, providing for the "Grandfather Clause"; amendment No. 12, to exempt capital invested in cotton mills from taxation for a period of ten years; amendment No. 13, limiting the pay of legislators to sixty days; amendment No. 14, providing for the recall of State officers; amendment No. 15, permitting municipalities to issue bonds. Of these nine acts and amendments, all except amendment No. 13 failed to receive the majority required by law. The acts are required to receive only a majority, but the amendments are required to receive a majority of the vote of the candidate in the election who received the highest vote. Amendment No. 15 received a majority, but not a majority of the highest vote cast for governor. The Supreme Court held that according to the constitution only three amendments can be submitted at one time, and ruled against this amendment without taking up the question of whether it received a sufficient number of votes to be adopted. When the Democrats wrested the government of Arkansas from the Carpet-baggers a constitutional convention was held and because of the outrageous misuse of the bond-issuing power in Arkansas by the Carpet-bag government, the constitution was made to prohibit the issuance of bonds by municipalities. The majority is now in favor of this privilege and already a campaign looking to submitting a bond amendment to the people at the next general election has been started.

The total vote for President in Arkansas was: Wilson, 68,838; Taft, 24,207; Roosevelt, 22,673. In April, Peter Stewart, a Socialist, was elected mayor of Hartford. He was the first Socialist mayor elected in the State. On December 16, 1912, Governor Donaghey paroled 360 State convicts. This was intended as a blow at the convict lease system which is employed in Arkansas. As the result of this action, three county convict camps in which convicts were leased to contractors were wiped out of existence. The lease to convict contractors working on the railroad expired on January 1, 1913, and as only enough convicts to work the State farm remained, the leases could not be renewed. In a statement Governor Donaghey declared he had consistently fought the convict lease system, but had found little or no support in the legislature. He declared that conditions in the convict camps were very bad and sought in this way to remedy conditions and recommended that the legislature of 1913 put a stop to the convict lease system by legislation. On January 3 United States Senator Jeff Davis died suddenly at his home in Little Rock.

STATE GOVERNMENT. Governor, J. T. Robinson; lieutenant-governor, W. C. Rodgers; secretary of State, Earle W. Hodges; treasurer, John W. Crockett; auditor and insurance commissioner, J. M. Oathout; attorney-general, W. M. Moose; superintendent of education, Geo. B. Cook; commissioner of agriculture, J. H. Page; commissioner of public lands, R. G. Dye—all Democrats.

JUDICIARY. Supreme Court—Chief justice, Edgar A. McCulloch; justices, F. G. Smith, C. D. Wood, William F. Kirby, and Jesse C. Hart; clerk of the court, P. D. English—all Democrats.

STATE LEGISLATURE, 1913. Senate, Democrats, 34; Republicans, 1; House, Democrats, 96; Republicans, 4; joint ballot, Democrats, 130; Republicans, 5. Democratic majority, Senate, 33; House, 92; joint ballot, 125.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

ARKANSAS, UNIVERSITY OF. A State institution of higher learning at Fayetteville, Ark., founded in 1871. The number of students enrolled in the several departments of the university in 1912 was about 500. The faculty numbered 80. In June, 1912, President J. M. Tillman resigned, and Professor J. H. Reynolds, head of the department of history and political science, was elected acting president until a permanent president is secured. Professor A. H. Purdue, State geologist and head of the department of geology, was given leave of absence to become State geologist of Tennessee; Dr. N. F. Drake of Stanford University to fill Professor Purdue's place. A \$45,000 building for the department of education is being erected from the Peabody educational fund. The income of the university is about \$225,000 per year. The number of bound volumes in the library is 20,000, and of pamphlets, 19,000.

ASBESTOS. The production of asbestos in 1911 was, according to the report of the United States Geological Survey, the largest in the history of the industry. The total amounted to 7604 short tons, valued at \$119,935. This is still less than 8 per cent. of the production of Canada, which supplies the bulk of asbestos used in the factories of the United States. In 1911, four States (Georgia, Vermont, Virginia, and Wyoming) produced this mineral. Vermont ranked first in the production and Georgia second. The imports of asbestos in the United States in 1911, chiefly as noted above from Canada, amounted to 57,124 long tons, valued at \$1,318,539. The total exports from Canada amounted to 75,120 short tons. Considerable quantities were imported from Italy, Russia, and Great Britain.

ASIA. See ANTHROPOLOGY, EXPLORATIONS, and articles on countries.

ASIA MINOR, EXCAVATIONS IN. See **ARCHAEOLOGY.**

ASPHALT. There was a greatly increased production of asphalt materials in 1911, chiefly as a result of the movement throughout the United States for better roads. The total production for the year was 360,004 short tons, valued at \$3,820,751, compared with 260,080 short tons, valued at \$3,080,067 in 1910. The asphalt produced included bituminous rock, 51,328 short tons; refined bitumen, 29,305 short tons; maltha, 8574 short tons; gilsonite, 30,236 short tons; oil asphalt, 234,951 short tons; grahamite, 5000 short tons. The States in which asphalt in these varieties is produced are California, Utah, Oklahoma, and Texas. In California were produced in 1911 190,945 short tons of all varieties; in Oklahoma, including Illinois and Kentucky, 82,387 short tons; in Texas, 55,826 short tons, and in Utah, 30,846 short tons. The imports of asphalt in 1911 amounted to 165,288 short tons, valued at \$789,236, compared with 186,311 short tons, valued at \$785,963, in 1910.

The chief countries producing asphalt are the United States, Trinidad, Germany, France, Italy, Spain, Austria, Russia, and Venezuela. The United States imported from Trinidad in 1911 111,630 tons, and the total exports from Trinidad to all countries was 179,718 short tons.

ASTOR, JOHN JACOB. An American capitalist, died at sea April 15, 1912. He was born at Rhinebeck, N. Y., in 1864, the son of William Astor. He was educated by private tutors and later took a scientific course at Harvard University, graduating in 1888 with the degree of B. S. For the two years following his graduation he traveled in unfrequented parts of Europe and in the partially unexplored regions of the Rocky Mountains. Soon after his father's death in 1892 he took over the management of the great Astor estates left by William Astor and began extensive building operations which added greatly to his fortune. These include the Astor, Netherlands, St. Regis, and Knickerbocker hotels in New York City. Throughout his life he was greatly interested in mechanics and invented several appliances. Among these were a patent bicycle brake and a pneumatic road improver. He also invented improvements on marine turbines and in 1902 gave to the world his rights in these patents. In 1906 he invented a fuel machine for the utilization of peat deposits. In 1910 he obtained a patent on a device for swivel chairs.

John Jacob Astor obtained the title of colonel as a member of the staff of Governor Morton. On the outbreak of the Spanish-American War he offered his services to the government and equipped a battery, which was presented to the government without cost. This battery did efficient service in the Philippines. Colonel Astor was commissioned inspector-general of volunteers with the rank of lieutenant-colonel. He served with General Shafter's army during the entire time that it was in Cuba and participated in the battle of Santiago. He was detailed by General Shafter to deliver the official terms of surrender to the Secretary of War, and was mustered out of service on November

1, 1898. Colonel Astor was director of many financial institutions and railways. He was one of the founders of the New Theatre and was active in the Hudson-Fulton celebration in New York City. He was also a member of many clubs and patriotic societies. He was the author of *A Journey in Other Worlds* (1890), and *A Romance of the Future* (1894). Colonel Astor was one of the victims of the *Titanic* disaster.

ASTRA-TORRES. See **NAVAL PROGRESS, Aviation.**

ASTRONOMY. No especially striking discoveries in observational astronomy marked the year 1912, though all departments of astronomical research showed steady and satisfactory progress. One new star, *Nova Geminorum*, No. 2, was discovered and was under observation by many astronomers during the greater part of the year; it bid fair to rival *Nova Persei*, which blazed forth in 1901, in its rapid fluctuations of brightness and in the surprising changes in the character of its spectrum. Further important advances in our knowledge of the sun were reported from the Mount Wilson Solar Observatory. The Königstuhl Observatory, at Heidelberg, still continued to report the greatest share of the discoveries of new minor planets, though its preëminence in that respect is beginning to be disputed by other observatories, notably by those at Simeis (Russia) and Johannesburg (South Africa). Although, as stated in the *YEAR BOOK* for 1911, the recent series of long-duration solar eclipses has come to an end, expeditions were fitted out for the purpose of observing the two eclipses which occurred during the year; the results from these expeditions may be considered as practically negligible, the second eclipse—visible in Brazil—being a complete failure on account of unfavorable weather conditions.

THE SUN. Mr. C. G. Abbot, in the *Report of the Smithsonian Astrophysical Observatory*, gave as the general mean for the solar constant, as determined from observations made by himself and Mr. Fowle at sea-level at Washington and at altitudes of more than a mile and nearly three miles on Mount Wilson and Mount Whitney, respectively, 1.922 calories (15° C.) per sq. cm. per minute. The solar radiation was found to be relatively greater in the infra-red region of the spectrum than in the ultra-violet, and it was suggested that this is possibly because the shorter radiations from the deeper layers of the solar atmosphere are selectively absorbed during their passage through the upper layers. It was estimated that the sources from which we receive solar radiations have temperatures between 5000° and 7000° abs. C. and mostly between 6000° and 7000°. Evidence of the existence of an irregular variation in the solar radiation was found; its amplitude is from 3 to 10 per cent., and its period is between five and ten days. In order to settle this important question, Mr. Abbot conducted a series of observations at Bassour, in Algeria, during the summers of 1911 and 1912, while one of his colleagues at the same time made observations at Mount Wilson.

Very little sun-spot activity was recorded during the year, the only notable spots being one of fairly large size and circular form which persisted from June 17 to 28, and a group containing two intense nuclei which made its appearance during the early part of October; but in neither case did the spots

approach in magnitude the most striking of those observed during the recent period of maximum solar activity.

Professor Dyson, the English Astronomer Royal, drew attention to a possible relationship between the six principal lines in the spark spectrum of radium as determined by Runge and Precht, and certain lines recorded by himself and Lockyer in the spectrum of the chromosphere observed at various eclipses of 1898, 1900, 1901, and 1905.

Professor C. L. Doolittle gave the results of a series of determinations of the aberration constant derived from latitude observations at the Sayre and Flower observatories extending over a period of thirty-two years. The value of the aberration constant finally obtained was $20.525''$, with a possible error of $.0043''$, and the corresponding value of the solar parallax was $8.780''$.

SOLAR ECLIPSES. Two eclipses of the sun occurred in 1912. Neither of them was of great importance, although in both cases expeditions were sent out for the purpose of observation. The first took place on April 17 and was visible along a line stretching from northern Portugal across France to Belgium. A certain amount of popular interest was aroused in it on account of the conflicting predictions which had been made concerning its character. Owing to the proximity of the apex of the moon's shadow to the surface of the earth, it had been predicted as a total eclipse by some astronomers and an annular eclipse by others. Actually, it was viewed as a total eclipse in Portugal and as an annular eclipse in France and Belgium, where observers had a splendid view of the phenomenon known as Baily's beads. The duration of totality was so short—barely a second—that the eclipse was not considered likely to add much to our knowledge of the sun. The corona as viewed in Portugal was reported to be of the minimum type associated with the periods of quiescent solar activity, such as that which prevails at the present time. The second eclipse, which occurred on October 10, was visible in Brazil, and several expeditions were fitted out for its observation, but owing to the fact that the bases chosen were in the centre of a widespread rain area, no results were obtained.

MOUNT WILSON SOLAR OBSERVATORY. In his annual report to the Carnegie Institution of the work accomplished at this observatory during 1911, Professor W. S. Adams, the acting director, gave a summary of the principal results obtained by himself and other members of the staff. Among the more important of these results may be mentioned the following:

Mr. C. E. St. John, who has been engaged for some time in the investigation of sun-spot spectra, has determined the probable system of circulation of calcium vapor in sun-spots and the regions surrounding them. In studying the radial motions of the spot-vapors, a phenomenon first discovered by Evershed, he has found that all the vapors of the reversing layer and chromosphere are involved in the movements. Of the high-level vapors of the chromosphere, viz., calcium, hydrogen, magnesium, and sodium, the calcium invariably has an inward radial motion across the penumbrae of the spots, the hydrogen generally, and the magnesium and sodium frequently. The radial motion in the case of calcium is occasionally

found combined with a rotary motion which gives rise to a vortical structure similar to that discovered in connection with the magnetic fields of sun-spots (see YEAR BOOKS for 1908 and 1911). The weaker or low-level lines of calcium, magnesium and sodium and the lines of the reversing layer show displacements in the opposite direction, indicating an outflow of the low-lying vapors, the highest velocity of outflow being associated with the lowest levels.

In furtherance of the coöperative plan for spectroscopic observations of the rotation of the sun adopted by the International Union for Coöperation in Solar Research at the Mount Wilson conference in September, 1910, Professor Adams completed a new series of observations, the results of which showed almost complete agreement with those of his previous investigation in 1908. Measurements upon spectra of the two opposite edges of the sun in three different regions of the spectrum, one of which, for purposes of comparison, was selected in common by all the observers taking part in the investigation, gave values for the equator and latitude 15° about 1 per cent. less than the values obtained in 1908, while between latitude 30° and the sun's pole the values were practically identical with those previously found. The general results fail to indicate any variation of the sun's rate of rotation, unless it be of long period. One of the most striking results brought out by these observations was the fact that the lines of different elements give different values of the rotation velocity. Thus the lines of lanthanum and cyanogen give low velocities, while certain lines of hydrogen, manganese and iron give comparatively high velocities. These observations are in substantial agreement with other evidence which we possess regarding the differences of level in the solar atmosphere, and indicate that the period of rotation increases as the surface of the sun is approached, or that the outer layers of the solar atmosphere rotate much more rapidly than those which lie close to the photosphere.

Other important investigations, notably of the Zeeman effect for iron, titanium, and a number of other metals, and of the displacements of the lines of the arc, spark, and furnace spectra of iron and titanium, were completed; and it is expected that these investigations will furnish material for important deductions regarding the physical condition of the stars. Much work was done by Mr. St. John on the question of the existence of free oxygen in the solar atmosphere, in the course of which he proved that the great α and β and A oxygen bands present in their solar spectrum are of purely terrestrial origin.

JUPITER. Mention was made in the YEAR BOOK for 1911 of the remarkable change in longitude experienced by the Great Red Spot, amounting to nearly eight degrees. This westward drift continued until the summer of 1912, when it became temporarily suspended; between June, 1911, and April, 1912, it amounted to twenty degrees, equivalent to about 22,000 miles per year. M. Quénnisset described other remarkable changes which had occurred on the planet during the recent opposition. The great northern equatorial band was observed to be much less pronounced and more irregular than in 1910 and 1911, while the north temperate band was much darker and broader than be-

fore, being nearer to the north pole of the planet. The south tropical spot was darker and better defined than in 1911, but had shrunk somewhat in size. Professor E. E. Barnard reported some interesting observations of the dark belt discovered by Molesworth in the latitude of the Red Spot in 1901. This peculiar feature of the planet's surface, which appears to have an accelerative effect on the motion of the Red Spot whenever they come together, underwent an extraordinary diminution in length from 115° in June, 1911, to 63° in the summer of 1912. It has a rotation period of 9

light of the shortest wave-lengths capable of traversing the earth's atmosphere, certain features are brought out which cannot be seen or photographed with visible light. The most conspicuous object thus detected was the area in the vicinity of the lunar crater Aristarchus, which shows as a dark patch on a photograph taken by means of ultra-violet light, but is invisible on an ordinary photograph. Professor Wood showed how by combining photographs taken by light from three or more regions of the spectrum it may be possible to begin the study of the petrography of the lunar surface.

WANDERING OF THE POLE, 1906-1911.

From the *Astronomische Nachrichten*

hours 55 min. 19 sec., or about 22 sec. shorter than the Red Spot, and whenever it has come into conjunction with it previously, as in 1902, 1904, 1906, 1908 and 1910, it has flowed northward over the bright tropical zone of the planet after skirting the southern border of the Spot.

LUNAR PETROGRAPHY. In an interesting article on "The Selective Absorption of Light on the Moon's Surface and Lunar Petrography," published in the *Astrophysical Journal*, Professor R. W. Wood continued his photographic researches into the constitution of the surface of the moon. He had previously shown that, when the moon is photographed by means of

A yellow image, corresponding very closely to the visual image, is taken through a deep orange screen, the violet image is obtained by giving a very short exposure without any screen, and an ultra-violet image is obtained by using a screen of silvered violet glass. For comparison, various rock specimens and sulphur deposits were photographed through the screens, and the general conclusion reached was that the patch is probably material which was at some time ejected from the crater by a volcanic blast, and consists of sulphur deposits or perhaps ash containing sulphur. By extending the range of the photographs to other regions of

the spectrum in which anomalies in reflecting power are shown by other mineral substances, data should be obtainable for a petrographic survey of the lunar surface.

NEW STARS. A new star of the fourth magnitude was discovered on March 12 in the constellation *Gemini* by Herr Enebo of Domaas, Norway. It was close to *Nova Geminorum, No. 1*, discovered by Professor Turner in 1903. In the course of a few days its brightness decreased to the fifth magnitude, while its spectrum was similar to those of *Nova Aurigæ* and *Persei* in the earlier stages. On the examination of plates taken before the discovery of the *nova*, it was found at Heidelberg that a star of brighter than magnitude 12 had occupied the same place on March 7, while two Harvard plates taken on March 11 showed the *nova* as a star of the fifth magnitude, although it could not be detected on two plates taken on the preceding day. There was a recrudescence of brightness on March 24, accompanied by a diminution in the redness of the star, and a second increase in brilliancy occurred on April 9. On April 19 its brightness was about 7, and the spectrum changed from an absorption to an emission spectrum, a change similar to that noticed in the case of *Nova Persei*. The magnitude became fairly stationary about the end of May, its value being about 8, with a slight brightening about June 7. The oscillations in brightness were somewhat similar to those of *Nova Persei* in 1901, but of smaller amplitude and longer period.

From observations at the Yerkes Observatory, in December, 1910, and January, 1911, Slocum found that the parallax of *Nova Lacertæ*, discovered by Espin in 1910, was .018", indicating that the outburst producing the *nova* occurred about 180 years ago.

VARIATION OF LATITUDE. It was first demonstrated by Küstner of Berlin in 1888 that observatories do not maintain absolutely invariable distances from the north pole of the earth. When it is considered that the maximum departure of the pole from its mean position is not more than half a second of arc, or less than fifty feet measured on the earth's surface, it is not surprising that the announcement was at first received with some suspicion, but, startling though the fact was, it was speedily confirmed by other observers. The immediate consequence of its discovery was the establishment of an International Latitude Service, whose duty it is to detect and record the sequence of changes in the position of the pole. Four stations, in Japan, California, Maryland, and Sicily, were chosen nearly on the same parallel and dividing it as nearly as possible into four equal quadrants. It is clear that if the pole is tipped toward one of the stations the latitude of that station will be increased while that of the station situated on the opposite side of the earth will be correspondingly diminished. In general it may be said that this is the case, but in a few years it became evident that, in addition to the actual motion of the pole, other causes were at work tending to change the latitude, for there were times when a small but decided increase of latitude was noticed at all four stations. The reality of these small variations of latitude was first suspected by Kimura in 1902, and accordingly this term in the variation has been called the "Kimura term." Various explanations of the Kimura term have been offered, but up to now it has baffled in-

vestigators. One explanation has been that it is due to anomalous refraction caused by an inclination of the atmospheric strata, but no such inclination has been observed, at least over any extended area. Shinjo suggested that the difference in temperature between the sun side and the shade side of the observing station could be sufficiently great to produce a pressure-gradient large enough to be responsible for the greater part of the term. In the *Astronomische Nachrichten*, Ross considered that the effect represented by the term was a physical one caused by a progressive change of the zenith point throughout the night at a rate varying with the season. For the further elucidation of the term, he suggested the installation of two special latitude stations on the equator 180° apart and at high altitudes.

In the *Astronomische Nachrichten*, Albrecht summarized the results secured by the International Latitude Service in 1911. It is shown that the maximum departure of the pole from its mean position occurred in that year, and that the spiral curve showing the wandering of the pole has now begun to coil up towards its centre. The accompanying chart, copied from the same journal, shows the wandering of the pole during the period from 1906 to 1911.

STELLAR AND NEBULAR PARALLAXES. Professor A. S. Flint published a list of the parallaxes of 124 stars chiefly between the magnitudes 1.5 and 2.5. Professor Max Wolf, of Heidelberg, basing his calculations on the assumption that many of the spiral nebulae are of intrinsically the same dimensions, determined the distances of eight nebulae from their parallaxes, and their diameters from the measured angular diameters combined with the distances. The distances of the nebulae selected for discussion range from 33,000 to 578,000 light years, and their diameters from 900 to 2200 light years.

MINOR PLANETS. For the fourth year in succession, the number of minor planets announced as new failed to reach the century. Of the seventy-six planets reported, no fewer than ten were actually photographed in 1911, though they were not recognized as new at the time. One of these, which received the provisional designation MF₆, was discovered at the Lowell Observatory at Flagstaff, Ariz., by Lampland, while the remaining nine, designated by the letters MF₇ to MF₁₁, NK, NK₂, and NK₃, were observed by Wood at the Johannesburg Observatory. The remaining sixty-six were provisionally designated by the letters NO to QB, with the addition of OG₆ and OK₂. This year, only twenty were announced from the Königsstuhl Observatory at Heidelberg by Professor Max Wolf (3), and his assistants Kaiser (12), Massinger (3), Voigt (1), and Helffrich (1). Of the remaining forty-six, seventeen were credited to Metcalf (Winchester, Mass.), ten to Beljowsky (Simels), six to Wood and van der Spuy (Johannesburg), four to Wood, three each to Mme. Beljowsky (Simels), and Palisa (Vienna), and one each to Baillaud (Paris), Bernard (Yerkes), and Rheden (Vienna). Six of the above minor planets were found to be identical with others previously known, so that the number of new asteroids not certainly identified with the discoveries of former years was seventy.

Permanent numbers were assigned to the following minor planets:

Number	Temporary Designation	Discoverer	Date of Discovery
715	LX	Wood	1911, Apl. 22
716	MD	Palisa	" Jul. 30
717	MJ	Kaiser	" Aug. 26
718	MS	Palisa	" Sep. 29
719	MT	Palisa	" Oct. 3
720	MW	Kaiser	" Oct. 18
721	MZ	Kaiser	" Oct. 18
722	NA	Palisa	" Oct. 18
723	NB	Palisa	" Oct. 21
724	NC	Palisa	" Oct. 21
725	ND	Palisa	" Oct. 21
726	NM	Metcalf	" Nov. 22
727	NT	Massinger	1912, Feb. 11
728	NU	Palisa	" Feb. 16
729	OD	Metcalf	" Feb. 9
730	OK	Palisa	" Apl. 10
731	OQ	Massinger	" Apl. 15
732	OR	Massinger	" Apl. 15

The names, *Albert*, *Transvaalia*, *Berkeley*, *Erida*, and *Mireille* were given to 594, 715, 716, 718, and 719 respectively.

In the YEAR BOOK for 1911, mention was made of the discovery of a new minor planet, whose rapidly increasing right ascension at opposition suggested some resemblance to Eros, and hence its possible use in determining the solar parallax. This was the planet MT, discovered by Palisa on October 3, 1911. Soon after discovery, and before a sufficiently large number of observations for an accurate determination of its orbit had been obtained, the planet was lost sight of, but fortunately it was picked up later. Calculations based on the earliest set of observations indicated that the planet had a period of about two and a half years, and its perihelion distance was found to be about 1.15 or almost the same as that of Eros, but the eccentricity of its orbit was nearly twice as great as that of the planet discovered by Witt in 1898. The next opposition will occur in March, 1913, but, as the planet will at that time be near aphelion, it will be unfavorably situated for observation; indeed, most of its oppositions take place when it is in the same unfavorable position. Later observations gave an increased value for the period, viz. about five years, and aphelion was found to lie beyond the orbit of Jupiter. As the planet approaches even nearer to the earth than Eros, and its diameter is probably not more than four or five miles, it is expected that the perturbations which the comparatively massive earth will produce in its orbit will provide data for a determination of the mass of the earth.

COMETS. The periodic comets due to return to perihelion in 1912 were Wolf's (1884 III.), De Vico-Swift's (1894 IV.) and Tuttle's (1858 IV.). The first named came to light in 1911, when it was first detected by its original discoverer, Professor Max Wolf, at Heidelberg. An account of it will be found in the YEAR BOOK for 1911. It passed through perihelion on February 11, 1912. De Vico-Swift's Comet has a period of about 6.4 years, and was due to pass through perihelion in December, but its return to the heavens had not been reported by the end of the year. Tuttle's Comet (1912 b) has a period of about 13.7 years, and was last seen in 1899. Originally discovered by Méchain in 1790, it was rediscovered by Tuttle in 1858 and was seen again in 1871, 1885, and 1899. It was

first detected during this return by Schaumasse at Nice on October 18, when it was a body of magnitude 11.5. Owing to planetary perturbations during its last cycle due to its close approach to Jupiter, the time of revolution of the comet in its orbit has been shortened by about 70 days, and perihelion passage took place on October 25 when the comet was about 97.6 million miles from the sun.

Only two new comets were discovered during the year. These were: Gale's Comet (1912 a). This comet was discovered by Gale at Waratah, New South Wales, on September 8. When first detected, it was a round object of the fifth magnitude and about two minutes in diameter; it possessed a nucleus but no tail. Perihelion passage occurred on October 4. On September 13 the comet was visible to the naked eye, the nucleus being star-shaped with an even coma of about four minutes in diameter surrounding it. It had then a fan-shaped tail with two branches extending about 5 degrees and making an angle of 60 degrees with each other. It remained visible until about the beginning of November, the angle between its tails increasing to more than 90 degrees. One striking peculiarity of this comet is the great inclination of the plane of its orbit to the ecliptic. Borrelly's Comet (1912 c) was discovered by Borrelly at Marseilles on November 2. It was reported as presenting the appearance of a round nebulosity of the tenth magnitude with a very indistinct nucleus and no tail. When it passed through perihelion on October 22, it was distant about 102 million miles from the sun.

Fayet announced that Schaumasse's Comet (1911 h), discovered on November 30, 1911, is a periodic comet with a period of about seven years.

BOOKS. Among the more important books published in 1912 are: Turner, *The Great Star Map*; Chambers, *Astronomy*; Symonds, *Nautical Astronomy*; Dreyer, *A Short Account of Sir William Herschel's Life and Works*; Kayser, *Handbuch der Spectroscopie, Bd. VI.*; Klinkerfues, *Theoretische Astronomie*. See CARNEGIE INSTITUTION.

ASTRO-PHYSICS. See ASTRONOMY.

ATHENS, EXCAVATION IN. See ARCHÆOLOGY.

ATHLETICS, TRACK AND FIELD. James Thorpe of the Carlisle Indian School by the wonderful showing he made in 1912 stamped himself as the greatest all-round athlete the world has ever seen. Others whose performances on the track and field made the year a most noteworthy one in the establishment of new records were James E. Meredith of Mercersburg Academy, who ran 800 meters in 1:51 9-10, and a half mile in 1:52½; Howard Drew, the negro sprinter, who equalled the American record of 9¼ seconds for 100 yards and the world's record of 7½ seconds for 70 yards indoors; Donald Lippincott of the University of Pennsylvania, who equalled the world's record of 10½ seconds for the 100 meters; Marc Wright of Dartmouth, who cleared the bar in the pole vault at a height of 13 feet 2¼ inches; Abel Kiviatt of the Irish-American A. C., who ran 1500 meters in 3:55½ and a mile in 4:15½; Hannes Kolehmainen of Finland, who ran 5000 meters in 14:36½; and George Horine of California, who in the running high jump cleared 6 feet 6¾ inches. See OLYMPIC GAMES.

The following All-American athletic team for the season of 1912 was selected by James E. Sul-

livan, secretary-treasurer of the A. A. U.: Seventy-yard run, H. P. Drew, Springfield (Mass.) High School; 100-yard run, Ralph Craig, Detroit Y. M. C. A.; 220-yard run, A. T. Meyer, Irish-American A. C.; 440-yard run, C. D. Reidpath, Syracuse University; 600-yard run, M. W. Sheppard, Irish-American A. C.; 880-yard run, J. E. Meredith, Mercersburg Academy; one-mile run, A. R. Kiviat, Irish-American A. C.; two-mile run, T. S. Berna, Cornell University; 120-yard hurdles, F. W. Kelly, University of Southern California; 220-yard hurdles, J. J. Eller, Irish-American A. C.; running broad jump, A. L. Gutterson, Boston A. A.; running high jump, G. L. Horine, Olympic Club, San Francisco; pole vault, H. S. Babcock, New York A. C.; standing high jump, Platt Adams, New York A. C.; standing broad jump, Ben Adams, New York A. C.; three standing broad jumps, L. Goehring, Mohawk A. C., New York; ten-mile run, H. J. Smith, New York City; marathon race, Gaston Strobino, South Paterson (N. J.) A. C.; one-mile walk, R. B. Gifford, McCaddin Lyceum, Brooklyn; running hop, step and jump, C. E. Brickley, Harvard University; shot-put, P. McDonald, Irish-American A. C.; shot-put (both hands), Ralph Rose, Olympic Club, San Francisco; 56-pound weight for distance, P. Ryan, Irish-American A. C.; hammer, M. McGrath, Irish-American A. C.; discus, J. H. Duncan, Bradhurst Field Club; javelin, H. G. Lott, Mohawk A. C., New York; five-mile run, H. L. Scott, South Paterson A. C.; all-around, James Thorpe, Carlisle Indian School; cross-country, W. J. Kramer, Long Island A. C., Brooklyn.

The senior championships of the A. A. U. were held at Pittsburgh, September 21, the Irish-American A. C. winning with a total of 67 points as against 34 points scored by the New York A. C. Other teams entered and their scores were: Boston A. A., 20; Springfield (Mass.) High School, 5; McCaddin Lyceum, Brooklyn, 5; University of Missouri, 5; Mohawk A. C., 5; Shannahan C. C., 3; unattached, 9. Among the unattached contestants was Hannea Kolehmainen, the Finnish runner, who won the 5-mile race. In the junior championships the New York A. C. was the victor by the narrow margin of 1 point, its total score being 31. The Irish-American A. C. finished second. The senior indoor championships were won by the Irish-American A. C. (70) with the New York A. C. (45) second. In the junior events the New York A. C. (24) finished first and the Irish-American A. C. (16), second. The all-around championship was won by James Thorpe of the Carlisle Indian School, who scored 7476 points out of a possible 10,000 in ten events. This is a new American record, the best previous performance having been that of M. J. Sheridan who in 1907 made 7385 points.

The thirty-seventh annual track and field meet of the Intercollegiate Association of Amateur Athletes of America was held at Franklin Field, Philadelphia, May 30 and June 1. Five new records were made. C. D. Reidpath of Syracuse ran 440 yards in 48 seconds; J. P. Jones of Cornell ran 800 yards in 1:53½; Paul Withington of Harvard ran 2 miles in 9:24½; R. A. Gardner of Yale cleared the bar in the pole vault at a height of 13 feet 1 inch, and Thomas Beatty of Columbia put the 16-lb. shot 48 feet 10¼ inches.

Pennsylvania won the meet with a total of 28 points. Cornell was second with 17½ points and Michigan third with 15 points. Other colleges scoring points were; Harvard, 13; Columbia, 13; Syracuse, 12; Dartmouth, 11½; Yale, 10; Wesleyan, 7; Brown, 6; Princeton, 5; Bowdoin, 2; Rutgers, 2; Massachusetts Institute of Technology, 1.

The University of California won the annual meet of the Conference Colleges of the West, held at Lafayette, Ind., June 1, scoring 41½ points. The University of Missouri, which won the 1911 championship, finished second with 29½ points. The totals for the other colleges were: Illinois, 26; Chicago, 15; Wisconsin, 12½; Colorado, 10; Minnesota, 8; Northwestern, Ames and Oberlin, 5 each; Wabash, 4½; Iowa, Purdue and Earlham, 1 each; Depauw, ½. California also won the Pacific Coast College meet.

In the New England Intercollegiate championships held at Springfield, Mass., May 17 and 18, Dartmouth was the victor with a total of 46 points. Brown was second with 23 and the M. I. T. third with 16. Other scores were: Bates, 12; Wesleyan, 10; Colby and Vermont, 8 each; Maine, 6½; Bowdoin, 6; Holy Cross, 5; Williams (winner in 1911), 5; Worcester P. I., 5; Trinity, 2½; Amherst, 1.

The English championships were held at London, June 22. G. H. Patchings of South Africa and T. R. Nicolson of Scotland made the best individual showings. Patchings won the 100 yard dash, was second in the 440-yards and third in the 220 yards while Nicolson won the 16-lb. hammer throw and was third in the shot-put. P. Kirwan of the Irish-American A. C., New York, for the second successive year won the broad jump.

ATLANTA, GA. See SEWAGE PURIFICATION.

ATLANTIC CITY See NEW JERSEY, *Politics and Government*.

ATLANTIC FLEET. See UNITED STATES, *Navy*.

ATMOSPHERE. See CHEMICAL PROGRESS, and METEOROLOGY.

ATOMIC WEIGHTS AND MEASURES. See CHEMISTRY.

ATOPHAN (PHENYL-QUINOLIN-CARBOXYLIC-ACID). This is a complex substance having the chemical formula $C_{20}H_{11}O_3N$. It is prepared by warming together pyroracemic acid, benzaldehyd, and anilin in alcoholic solution. The drug crystallizes in small, colorless needles, having a melting point of 208° to 209° C. It is insoluble in water, but readily soluble in alkalies, hot alcohol, and boiling glacial acetic acid. Atophan has the property of increasing uric acid elimination. Under moderate doses of the drug the normal average daily output of uric acid may be doubled or trebled, and it is therefore introduced as a substitute for the salicylates in rheumatic conditions and gout. It is said to be particularly efficient in acute attacks of gout, arthritis, and articular rheumatism, but less valuable in chronic types of these diseases.

AUCKLAND ISLANDS. A dependency of New Zealand (q. v.).

AUGUSTA, GA. See CITY PLANNING.

AUSTIN, HENRY. An American lawyer and writer, died October 17, 1912. He was born in Boston in 1848. He held various editorial positions in Boston, New York, Baltimore and

New Orleans, and was at one time associated with Edward Bellamy and others. He wrote many poems, which were collected in a volume entitled *Vagabond Verses*. He also wrote *The Story of Government*, and *A History of Tammany*, as well as several volumes of fiction.

AUSTRALIA, COMMONWEALTH OF. A self-governing dependency of the United Kingdom from January 1, 1901, consisting of six federated states, the Northern Territory, and the Federal Capital Territory. The temporary seat of the federal government is Melbourne, the capital of Victoria. The permanent capital will be in the Yass-Canberra district of the Federal Capital Territory within the state of New South Wales. See CITY PLANNING.

AREA AND POPULATION. The estimated area and the population according to the censuses of March 31, 1901, and April 3, 1911, are as follows:

	Sq. m.	Pop. '01	Pop. '11
New South Wales...	310,372	1,354,846	1,646,724
Victoria	87,884	1,201,070	1,315,551
Queensland	670,500	498,129	635,813
South Australia.....	380,070	358,346	408,558
Western Australia...	975,920	184,124	282,114
Tasmania	26,215	172,475	191,211
Northern Territory..	523,620	4,811	8,310
Federal Capital Territory.....(about 900)		1,714
Commonwealth.....	2,974,581	3,773,801	4,455,005

* Including the Federal Capital Territory.

The census returns do not include full-blooded aborigines. Such of these, however, as were in the employ of whites, or were living in contiguity to the settlements of whites were enumerated, numbering in 1911 19,939. The total number of aboriginal natives is unknown. A general opinion has prevailed that there are about 150,000, but an estimate made in 1908 by the Queensland chief protector of aborigines is only about 74,000.

The 1911 census showed 2,313,035 males and 2,141,970 females, or 107.99 males per 100 females. Persons of non-European race numbered 52,353, or 1.175 per cent. of the total; these included 37,789 full-bloods (34,839 Asiatic, 2524 Polynesian) and 14,554 half-castes (10,113 Australian, 3852 Asiatic). The following figures show the population specified as to birthplace in 1901 and 1911 respectively: Australasia, 2,934,091 and 3,699,540 (Commonwealth, 2,908,303 and 3,667,672); Europe, 753,832 and 664,671; Asia, 47,014 and 36,442; Africa, 2869 and 4958; America, 12,507 and 11,278; Polynesia, 10,363 and 3410.

Classification by religion in 1911 was: Christian, 4,274,414; non-Christian, 36,785; indefinite, 14,673; no religion, 10,016; object to state, 83,003; unspecified, 36,114. The Christians included: Church of England, 1,710,443; Roman Catholic, 921,425; Presbyterian, 558,336; Methodist, 547,806; Protestant (undefined), 109,861; Baptist, 97,074; Catholic (undefined), 75,379; Congregational, 74,046; Lutheran, 72,395; Jews numbered 17,287.

The figures for conjugal conditions are: Never married, 2,783,543; married, 1,469,622; widowed, 191,743; divorced, 4500; not stated, 5597.

A remarkable feature of the distribution of population in Australia is the tendency to accumulate in towns, especially in the capital cities. In every state the population of the

capital far exceeds that of any other town therein and, with suburbs, ranges between 21 and 46 per cent. of the entire population of the state. The following table shows: a population of the capital cities, April 3, 1911; b and c their populations including suburbs (that is approximately within a ten-mile radius of the post office) in 1901 and 1911 respectively; d the percentage of the 1911 population with suburbs on the total of the state:

	a	b	c	d
Sydney, N.S.W.	112,921	487,932	629,503	38.19
Melbourne, Vict.	103,593	496,379	588,971	44.82
Brisbane, Qld.	35,491	119,428	139,480	23.03
Adelaide, S. Aus.	42,294	162,261	189,646	46.06
Perth, W. Aus.	35,767	36,274	106,792	37.86
Hobart, Tas.	27,526	34,604	39,937	20.87
Total	357,592	1,336,578	1,694,329	38.05

The total increase in population from 1901 to 1911 was 681,204 (18.05 per cent.), of which the metropolitan increase was 357,751 and the increase in the rest of the country 323,453. Of the metropolitan increase 234,463 is credited to Sydney and Melbourne. It must be noted further that most of the increase outside the metropolitan areas—323,435—was in towns rather than in the rural districts; many rural counties actually showed a decrease from 1901 to 1911. It is apparent that this distribution of population marks an unsound economic condition.

Population of the other largest towns, within a ten-mile radius, April 3, 1911: Newcastle, N. S. W., 62,406; Ballarat, Vict., 52,551; Bendigo, Vict., 41,757; Parramatta, N. S. W. (five-mile radius and excluding a portion thereof lying within the Sydney ten-mile radius), 34,558; West Maitland, N. S. W., 33,787; Geelong, Vict., 33,518; Broken Hill, N. S. W., 31,386; Kalgoorlie, W. Aust., 31,324; Launceston, Tas., 25,227; Rockhampton, Qld., 20,915; Bulli, N. S. W., 20,873; Toowoomba, Qld. (five-mile radius), 19,776.

The increase of population in Australia is due far more to excess of births over deaths than to immigration. From 1901 to 1910 inclusive the natural increase, or excess of births over deaths, was 619,259, while during the same period the net immigration, or excess of arrivals over departures, was only 40,485. Statistics for 1911: Arrivals, 141,909; departures, 72,609; net immigration, 69,300;—Births, 122,193 (birth rate, 27.21); deaths, 47,869 (death rate, 10.66); excess of births over deaths, 74,324; marriages, 39,482 (marriage rate, 8.79). The percentage of illegitimate to total births in 1910 was 5.84. Estimated population December 31, 1910, 4,425,083; December 31, 1911, 4,568,707.

The Northern Territory was under the jurisdiction of South Australia from 1863 to January 1, 1911, when it was transferred to the Commonwealth. In 1905 the Commonwealth assumed the administration of Papua (q. v.).

The Federal Capital Territory was taken over by the Commonwealth from New South Wales January 1, 1911. The Commonwealth also acquired certain territory at Jervis Bay, together with the right to construct and operate a railway from the new capital thereto. The area of the Federal Capital Territory is approximately 900 square miles, or 576,000 acres, of which it will be necessary to reserve from occupation the catchment area of the Cotter

River, 170 square miles, or 108,800 acres. An area of about 12 square miles, or 7680 acres, has been set apart for the city site, and it is proposed to reserve a further area of about 100,000 acres for parks, roads, military college (opened June 27, 1911), and other public purposes, leaving 359,520 acres available for profitable occupation. The site of the city is 204 miles distant from Sydney, 429 from Melbourne, 912 from Adelaide, and 929 from Brisbane. For the railway to Jervis Bay a route has been selected about 96 miles in length. In 1911 the Commonwealth government invited competitive designs for laying out the capital city, and 149 designs were received. The first premium was awarded to Walter Burley Griffin, Chicago; second premium, Eliel Saarinen, Helsingfors; third premium, D. Alf Agache, Paris. See CITY PLANNING.

EDUCATION. According to the 1911 census, persons able to read and write English numbered 3,650,030; read only, 15,009; able to read and write a foreign language only, 26,210; read only, 2647; not stated, 95,727. Public instruction is under the control of the separate states. Primary instruction is free and compulsory. The following statistics relate to 1910:

	N. S. W.	Vict.	Qld.	S. Aust.

In 1910 the net cost of primary education, including buildings, was £2,985,628, or £6 11s. per pupil in average attendance, as compared with £4 9s. 3d. in 1901. There are a number of superior and technical schools. In 1910 the four universities, Sydney, Melbourne, Adelaide, and Tasmania (at Hobart), had 233 teachers and 3272 students. The University of Queensland, at Brisbane, was opened in 1911.

MINERALS. It was the discovery of gold in payable quantities (in New South Wales and Victoria in 1851) that first attracted population to Australia and thus laid the foundation of the state, but the value of mineral production is now considerably less than that of the agricultural or the pastoral industry. The following table shows the value of the most important minerals, and the total for all minerals, produced in 1910, and the grand total of production from the beginning of mining in Australia to the end of that year; comparative figures are also given for 1909 and 1901:

	Gold £	Coal £	Copper £	Sil. Id.† £
N. S. W..	802,211	3,009,657	486,257	2,110,040

*Incl. Northern Ter. †N. S. W., 1899.

Totals in the foregoing table are exclusive of returns relating to building stone, slates, cement, etc. To the end of 1910 the total output of gold, the most important mining product, was valued at £525,645,357. Further figures for gold for 1901, 1903 (the year of greatest output), and 1911 (subject to slight revision), and the total production from the beginning of mining to the end of 1911:

	1901 £	1903 £	1911 £	Total £

Cmlth.	14,005,732	16,294,684	10,551,624	536,196,981

The greatest yields of gold in each state have been as follows: New South Wales, £2,660,946 in 1852; Victoria, £12,214,976 in 1856; Queensland, £2,871,578 in 1900; South Australia, £76,025 in 1904; Western Australia, £8,770,719 in 1903; Tasmania, £327,545 in 1899; Northern Territory, £111,945 in 1881.

AGRICULTURE. The acreage under crop (exclusive of grasses), and under artificially sown grasses was as follows in the year 1910-11: New South Wales, 3,386,017 and 1,055,303; Victoria, 3,925,070 and 991,195; Queensland, 667,113 and 140,196; South Australia (including Northern Territory), 2,746,694 and 26,416; Western Australia, 855,024 and 8348; Tasmania, 286,920 and 493,233; Commonwealth, 11,893,838 and 2,714,691, as compared with 10,972,299 and 2,457,856 in 1909-10 and 9,433,455 and 2,144,858 in 1905-6. Area and production of the leading crops in 1910-11:

It is of interest to note that in Australia a very large proportion of the hay crop is cereal grasses, mainly wheat and oats. Thus, of the 638,577 acres of hay in New South Wales, 422,972 were wheat, and of the 832,669 acres in Victoria, 575,791 were oats. Crop values for the Commonwealth, 1910-11 (exclusive of the value of straw in the case of cereal crops): Wheat, £16,458,187 (£2 4s. 8d. per acre); oats, £1,709,378 (£2 10s. 6d.); corn, £1,805,548 (£4 7s. 0d.); hay, £8,502,932 (£3 15s. 4d.); barley, £400,054 (£3 13s. 10d.); potatoes, £1,940,857 (£12 16s. 2d.); green forage, £1,709,000 (£2 17s. 7d.). Sugar output in 1910-11: Queensland, 207,264 tons; New South Wales, 18,828 tons; total, 226,092 tons, against 147,403 in 1910-11 and 172,242 in 1905-6.

* In 1901.

Cattle (including calves) slaughtered in 1910, 1,363,074, against 1,177,791 in 1909 and 1,110,157 in 1901. Sheep (including lambs) slaughtered in 1910, 15,679,915, against 13,386,856 in 1909 and 8,972,169 in 1901. Australia has more sheep than any other country in the world; Argentina ranks second with 67,383,952 in 1910. Estimated wool production, stated as in the grease, was 792,868,466 lbs., valued at about £32,000,000 in 1910; 1909, 718,037,132 lbs., about £28,000,000; 1906, 577,673,431 lbs.

MANUFACTURES. For statistical purposes a manufactory is defined as any factory, workshop, or mill where four or more persons are employed or power is used. The following table, relating to 1910, shows the number of employees, salaries and wages paid (exclusive of amounts drawn by working proprietors), and value of output:

	Mft.	Empl.	Wages	Output
N. S. W.	4,823	99,746	£ 8,691,386	£ 49,615,643

1910	15,467	949	16,416	1,016	17,432

Mileage (government) under construction, June 30, 1911, 2634; authorized, 1645. Cost of construction and equipment of government lines to June 30, 1911, £152,855,231; for the year ended on that date, percentage of working expenses to gross earnings, 61.94, compared with 61.70 in 1910 and 58.87 in 1906. The authorized transcontinental line will connect the railways of the eastern and southern districts of Australia with the Western Australian lines, the terminals being Port Augusta (S. Aust.) and Kalgoorlie (W. Aust.) This line will be built on standard gauge, 4 feet, 8½ inches, and it was believed that all the railways of the Commonwealth so far as it is possible will be brought to this basis. The length will be 1100 miles. A proposal for another transcontinental line is to extend the main northern line from Adelaide, which at present terminates at Oodnadatta, as far as Pine Creek, the southern terminal of the Northern Territory line from Darwin. The route now followed by the telegraph line is 1140 miles long. Telegraphs, exclusive of railway telegraphs, December 31, 1910: Lines, 44,100 miles; wire, 96,825; offices, 3883. Post offices in 1910, 5506 (5256 in 1906); in addition, receiving offices, 2328 (2145).

FINANCE. The table top of adjoining column gives the Commonwealth revenue and expenditure for the year ended June 30, 1911.

Not included in this expenditure is the subsidy paid to the states, which in the fiscal year 1911 was £5,603,191; 1910, £8,492,436; 1909, £7,930,395. Commonwealth notes issued

and unredeemed, March 27, 1912, £10,048,472; gold reserve, £4,841,536. Revenue for fiscal year 1911-12, £20,546,361; expenditure, £14,721,938.

Revenue		Expenditure	
Customs ...	£10,507,080	Posts	£ 3,559,785
Excise	2,473,364	Treasury	†1,960,318
Posts	3,906,015	Defense	1,395,798
Land tax....	1,370,344	T'de & cus...	1,051,497
Total*	18,806,287	Total*	13,158,529
1910	16,540,669	1910	7,499,516
1909	14,350,793	1909	6,420,398

* Including other items. † Of which, £1,874,568 for invalid and old-age pensions.

State consolidated revenue and expenditure for year ended June 30, 1911, and outstanding debt on that date:

	Revenue	Expend.	Debt
N. S. W....	£13,839,139	£13,807,538	£95,623,926
Victoria.....	9,204,603	9,194,167	* 57,983,764
Queensland...	5,320,008	5,214,737	44,618,197

Total	37,365,653	37,249,315	† 267,127,283
1910	36,956,812	35,373,254	257,623,663
1906.....	31,273,984	29,864,490	238,427,820

* Includes an advance of £750,000 from S. Aust. to Vict. † Includes Northern Ter. debt, £3,657,385, and debt on Port Augusta-Oodnadatta railway, £2,240,011. ‡ Against which, sinking fund £5,442,379.

In the fiscal year 1911, the aggregate state revenue from railways and tramways was £19,176,212; expenditure thereon, £12,137,748. Aggregate state loan expenditure in the fiscal year 1911, £11,926,123 (of which £6,884,430 for railways and tramways; total to end of that year, £260,988,517 (£159,204,321)).

ARMY. On June 30, 1912 expired the first twelve-month's operation of the Australian Defense acts of 1909 and 1910, which provided for compulsory enrollment and training of cadets and a national guard. There were enrolled during the year a strength of 92,276 cadets, but of these only 60,418 had made the regulation number of drills, so that there resulted enormous prosecutions and the infliction of fines and penalties of additional service. Some 19,000 young men, who had attained the requisite age, were passed into the Citizen Defence Force from the senior cadets, while 15,809 junior cadets who received physical culture drill were passed as physically fit. During 1912 the government was devoting \$500,000 to the provision of proper drill halls and other facilities, as their lack was interfering somewhat with the complete carrying out of the scheme. The plan of organization of the military force of the Commonwealth resulted from Lord Kitchener's report which recommended an army of 80,000 on a peace basis, divided into a garrison of 40,000 and a mobile force of 40,000. Before the requisite legislation was enacted this plan was amended by Senator Pearce so that the law increased the establishment and provided for 93 infantry battalions, 28 light cavalry regiments, 224 guns, 14 engineer companies, and departmental troops. This force will be formed from trained men from 19 to 25 years of age, who have undergone cadet training and in time of war the total strength will be increased to 107,000, while all Australia was to be divided into 215 territorial districts, every two towns or three country areas forming an infantry

battalion. It was reported that during the year over 89,000 men were under arms.

NAVY. War vessels in commission at the end of 1912 included the cruisers *Encounter* and *Protector* and the gunboats *Gayundah* and *Paluma* (all of which are used as training ships), the training-ship *Tingera*, the torpedo-boat destroyers *Warrego*, *Yarra*, and *Parramatta*, and the torpedo boats *Countess of Hopton* and *Childers*.

In 1911 the Commonwealth government adopted a programme of naval construction covering a period of twenty-two years and providing for a fleet of 8 battle-cruisers, 10 protected-cruisers, 18 destroyers, 12 submarines, and other vessels. At the end of 1912, the battle-cruiser *Australia* (launched October 25, 1911) was completing at Clydebank; the protected cruiser *Melbourne* (launched May 30, 1912) was completing at Birkenhead, and the protected-cruiser *Sydney* at Glasgow; the protected-cruiser *Brisbane* was building at Sydney, N. S. W.

GOVERNMENT. The legislative power is vested in a parliament of two houses, the Senate (36 members, 6 from each state), and the House of Representatives (75, in proportion to state population). Members of both houses are elected by universal adult suffrage. The executive power is vested in the British sovereign acting through his appointee, the governor-general, who is assisted by a responsible ministry, the executive council. The governor-general in 1912 was Baron Denman, who succeeded the Earl of Dudley, July 31, 1911. Ministry in 1912 (from April 29, 1910): Prime minister and treasurer, Andrew Fisher; attorney-general, William Morris Hughes; external affairs, Josiah Thomas (from October 14, 1911); home affairs, King O'Malley; postmaster-general, Charles Edward Frazer (from October 14, 1911); defense, George Foster Pearce; trade and customs, Frank Gwynne Tudor; without portfolio, vice-president of the executive council, Gregor McGregor; honorary ministers, Edward Findley and Ernest Alfred Roberts (from October 23, 1911).

Each state has a parliament elected, like the federal parliament, by universal adult suffrage. Members of the upper and of the lower house respectively, are as follows: New South Wales, 62 and 90; Victoria, 34 and 65; Queensland, 44 and 72; South Australia, 18 and 40; Western Australia, 30 and 50; Tasmania, 18 and 30. The governor of each state is appointed by the Crown and is assisted by a responsible ministry. The governors and prime ministers respectively in 1912 were: New South Wales, Baron Chelmsford, and J. S. T. McGowen; Victoria, Sir John Michael Fleetwood Fuller and W. A. Watt; Queensland, Sir William MacGregor and D. F. Denham; South Australia, Admiral Sir Day Hord Boscawen and A. H. Peake; Western Australia, Sir Gerald Strickland and J. Scaddan; Tasmania, Maj-Gen. Sir Harry Barron and Sir N. E. Lewis. Sir Gerald Strickland was appointed to succeed Baron Chelmsford as governor of New South Wales in 1913, and Sir Harry Barron to succeed Strickland in Western Australia. A. E. Solomon succeeded Sir N. E. Lewis as premier of Tasmania.

HISTORY

THE LABOR PARTY'S PROGRAMME. At an important conference of the Labor party at Ho-

bart in January the party platform as amended contained the following planks: (1) Maintenance of a "White" Australia; (2) a graduated tax on unimproved land; (3) effective federation; (4) the "new" protection; (5) nationalization of monopolies; (6) amendment of the Arbitration act; (7) navigation law; (8) Commonwealth passenger and freight steamships; (9) restriction of public borrowing; (10) establishment of a general insurance department; (11) Commonwealth sugar refining. The conference declared that legislative action had been taken on the following planks of their 1908 platform: (1) "White" Australia; (2) old age and invalid pensions; (3) graduated tax on unimproved land; (4) citizen army with compulsory training; (5) a Commonwealth bank; and (6) electoral reform. Thus they had carried into effect more or less completely the greater part of their previous programme. It remained to proceed further along those lines and to deal with these additional policies. As to the "new" protection and the nationalization of monopolies, they depended on the referenda of 1911, which resulted adversely, by a large majority, but the conference decided unanimously to appeal again to the people at the next general election. To explain briefly the chief planks in the amended platform: The first, that which relates to a "White" Australia means, as the term implies, a reservation of all territory belonging to the Commonwealth for exclusive settlement by people of European origin. The practical and immediate object, now that the Commonwealth has the Northern Territory (taken over from South Australia at the beginning of 1911) is the settlement and development of the land by whites. The plan formulated by the government to this end comprises the sending out of expeditions to explore and test the capacities of the territory, the establishment of a leasehold system for land settlement and development and the provision for a settlers' bank whence capital, for land improvement, may be had on favorable terms. As to the land tax it has been in effect since 1910 and, according to the Labor party, has been successful in its object of reducing the large estates, and checking the evils of absentee ownership. They therefore favor its continuance. The term "effective federation" means an increase of the federal power in order to admit of the nationalization of monopolies. The fourth plank, concerning the "new" protection, has been explained in previous issues of this YEAR BOOK. Briefly, the object of the "new" protection is to keep the native market for native manufacturers by adequate customs duties, provided that they pay fair wages, ask fair prices, and do not enter into "combines." This principle was embodied in the Excise Tariff act of 1906 which, after causing much confusion in industrial affairs and after long and costly litigation, was pronounced unconstitutional by the High Court (in 1908), as regulating the territorial trade and industry of the states, as discriminating between states and parts of states, and as dealing with other matters than taxation. The contemplated amendment to the Arbitration and Conciliation act was to prohibit lawyers from appearing before the courts on behalf either of the unions or the employers.

PARLIAMENT. The Commonwealth Parliament was opened on June 19, by the governor-general, Lord Denman. The principal subject of his speech was the birth-rate. It

was admitted to be altogether too low for a young country. There had been a marked increase in immigration to which the land tax had largely contributed, but the increase of the population was still too small. The government was now planning to bestow a maternity grant on the mothers of children born in the Commonwealth. A motion of censure was brought on June 20 by Mr. Deakin declaring that the government deserved censure for failing to realize its national and constitutional obligations, for neglecting its duty to secure industrial peace and uphold the law, for mal-administration and excessive partisanship, and for its reckless financial policy. It was defeated by a vote of 35 to 25. The maternity bill was passed during the session and went into effect in October. It provided for the payment of a bonus up to a maximum of £5 for every child born of white parentage in the Commonwealth. Other important subjects before Parliament were the encouragement of immigration, the opening of the leasehold lands in the Northern Territory, the plan for a preferential tariff agreement with Canada and the proposals for an arrangement with New Zealand for the joint defense of the Pacific. Owing to the friction between the federal and New South Wales governments, the latter refused to renew the lease of the Government House at Sydney after October 31. This caused much indignation among the citizens of Sydney and upon the departure of Lord Denman on October 7, the mayor delivered an address in which the government was blamed for its action.

MISCELLANEOUS. The trans-Australian railroad to connect Port Augusta in South Australia with Kalgoorlie and to open communication between Western Australia and the other states was formally begun on September 20, Lord Denman turning the first sod at Port Augusta. A body of cadets of the newly organized army visited England in March and were entertained by official corporations in London and other cities. See MINIMUM WAGE, and ARBITRATION AND CONCILIATION, INDUSTRIAL.

AUSTRALIAN ANTARCTIC EXPEDITION. See POLAR EXPLORATION.

AUSTRALIAN CAPITAL COMPLETION. See CITY PLANNING.

AUSTRIA-HUNGARY. The Austro-Hungarian monarchy consists of the Austrian empire, the Hungarian kingdom, and the territory of Bosnia and Herzegovina. The capital of Austria is Vienna, and of Hungary, Budapest. In these cities the common legislature (the Delegations) convenes alternately. The sovereign resides at Vienna.

AREA AND POPULATION. The table below shows the area and population of Austria by crownlands, of Hungary by divisions, of Bosnia, and of Herzegovina. The figures for area are shown in square miles, calculated from square kilometers as given in the latest available official reports. The population is shown according to the final figures for population present (*ortsanwesende Bevölkerung*) of the censuses of December 31, 1900, and December 31, 1910. It must be noted, however, that for Bosnia and Herzegovina the population figures are those of the censuses of April 22, 1895, and October 10, 1910, and hence the totals given for the monarchy cannot be quite exact. Moreover, the figure for the population present in the monarchy in 1900 is 45,

405,287, as Bosnia and Herzegovina were not annexed until October 5, 1908.

* Census of April 22, 1895. † Census of October 10, 1910.

Of the Austrian population in 1910, 14,034,022 were male and 14,537,912 female. The 1910 census showed the inhabitants of Austria to be divided according to religion as follows: Roman Catholic, 22,530,169; Greek Catholics, 3,417,223; Jewish, 1,313,687; Greek Oriental, 606,764; Evangelical (Augsburg), 444,307; Evangelical (Helvetian), 144,379; Old Catholic, 21,288; other, 13,634; without confession, 20,789.

In Austria, among the civil population, there were in 1910: Marriages, 214,600; births and deaths, 944,948 and 624,240 (each including stillbirths). In Hungary, among the population civil and military: Marriages, 179,510; births and deaths, 758,467 and 506,286 (each including stillbirths). In Bosnia and Herzegovina: Marriages, 20,651; births and deaths, 77,343 and 52,010 (each including stillbirths). Emigration from Austria-Hungary: 1908, 101,275 (of whom 56,214 from Austria); 1909, 272,266 (143,532); 1910, 278,240 (148,638). Population present of the larger cities (census of December 31, 1910): In Austria, Vienna, 2,031,498; Prague, 223,741; Trieste (with territory), 229,510; Lemberg, 206,113; Graz, 151,781; Cracow, 151,886; Brinn, 125,737; Czernowitz, 87,128; Pilsen, 81,165; Königliche Weinberge, 77,093;

Zizkow, 72,195; Pola, 70,145; Linz, 67,817; Przemyśl, 54,069; Innsbruck, 53,194; Smichow, 51,815;—in Hungary, Budapest, 880,371; Szeged, 118,328; Szabadka (Maria-Theresiopel, 94,610; Debreczen, 92,729; Zagráb (Agram), 79,038; Pozsony (Pressburg), 78,223; Temesvár, 72,555; Kecskemét, 66,834; Nagy-Váradi (Grosswardein), 64,169; Arad, 63,166; Hódmező-Vásárhely, 62,445; Kolozsvár (Klausenburg), 60,808; Ujpest (Neupest), 55,197; Miskolcz, 51,459. Sarajevo in Bosnia had in 1910, 51,919 inhabitants, and Mostar in Herzegovina 16,392.

EDUCATION. Throughout the monarchy elementary instruction is free and compulsory. In Austria there were, at the end of 1909, 23,450 elementary schools (including 1208 private), with 105,370 teachers and 4,454,238 pupils; children of school age, 4,744,521; training colleges, 133. In 1912 gymnasias numbered 316 (105,002 students); realschulen, 149 (49,065). There are many technical, professional, and special schools. The state maintains eight universities, which in 1911-12 were reported to have 1920 teachers and 29,742 students. The eight government technical high schools had, in 1911, 833 teachers and 11,174 students.

In Hungary there were, in 1909-10, 19,206 primary schools, with 46,340 teachers and 2,903,817 pupils; children of school age, 3,112,600; 95 training colleges, with 10,174 students; 197 gymnasias, with 3787 teachers and 63,338 students; 43 realschulen, with 978 and 14,424. There are many technical and professional schools. The three universities maintained by the state had, in 1910, 610 professors, etc., and 10,040 students.

AGRICULTURE. Area in hectares (2.471 acres) of principal crops harvested in Austria in 1910 and 1911, with production in metric quintals (220.46 pounds) and yield per hectare in 1911:

Crops	Hectares		Quintals		Qs. per ha.
	1910	1911	1910	1911	
Wheat	1,213,579	1,215,090	15,673,315	16,026,388	13.2
Rye	2,060,980	2,021,345	27,671,921	26,446,569	13.1
Barley	1,101,625	1,096,677	14,722,147	16,201,813	14.8
Oats	1,833,018	1,878,058	20,631,564	22,700,639	12.1
Corn	311,773	300,813	4,416,782	3,041,344	10.0
S. Beet	253,731	247,115	70,618,000	42,498,000	172.0

Various yields in 1910, not given above, in thousands of quintals: Beets (other than sugar beets), 41,510; potatoes, 133,664; hempseed, 127; mixed grains, 728; buckwheat, 1300; millet, 395; pulse, 2631; flaxseed, 169; hops, 165; cabbage, 8397; clover hay, 45,795; mixed fodder, 6750; hay, 101,169. Wine production in 1910, 2,547,000 hectoliters. Silkworm eggs placed for hatching in 1912, 10,245 hectograms; estimated production of cocoons, 2,110,000 kilograms, against 2,162,113 kgs. produced in 1911.

Production in 1912: Wheat, 18,952,639 quintals (15.0 qs. per ha.); rye, 29,748,033 (14.6); barley, 17,065,756 (16.0); oats, 24,300,998 (13.0); corn, 3,875,179 (12.8). Planted to sugar beets in 1912, 262,612 hectares.

Livestock in 1910 included 9,159,808 cattle, 2,428,586 sheep, and 6,431,966 swine.

For Hungary the harvested area of the principal crops in 1911 and 1912, their production, and the yield per hectare in 1911 are shown below:

Crops	Hectares		Quintals		Qs. per ha.
	1911	1912	1911	1912	
Wheat	3,708,399	3,820,988	51,919,122	50,176,446	14.0
Rye	1,185,987	1,207,750	13,800,299	14,398,031	11.6
Barley	1,171,659	1,128,749	16,708,600	15,891,585	14.3
Oats	1,173,657	1,103,291	13,948,693	11,155,771	11.9
Corn	2,878,772	2,883,189	41,004,415	54,850,169	14.2
Flax	9,592
S. beet	172,326	19,500,000	15,000,000
Vines	328,168
Tobacco	47,581

In 1910, 1,242,000 hectares were planted to potatoes, yielding 133,664,000 quintals. Silkworm eggs placed for hatching in 1912, 20,071 hectograms; estimated production of cocoons, 1,694,000 kilograms, against 1,878,276 kgs. produced in 1911.

Livestock in Hungary proper, according to a census taken in the spring of 1911, with percentage of increase or decrease as compared with the figures of the 1895 census: Horses, 2,000,611 (1.4 per cent.); mules and asses, 18,765 (15.8 decrease); cattle (including 155,192 buffaloes), 6,183,424 (6.1 increase); sheep, 7,696,881 (2.3); swine, 6,415,197 (0.5 decrease); goats, 331,383 (15.7 increase). While the increase in the number of cattle was not proportionate to the increase of population, there was a great improvement in the quality of the stock; the breed known as "spotted" cattle, introduced with a view to improving the stock, increased from 1,347,826 in 1895 to 3,590,808 in 1911. The decrease in swine was due to the prevalence of disease during the preceding ten years. During the twelve months preceding the census there were born 1,672,678 calves, of which 824,932 were kept for breeding, 241,975 sold for breeding, 15,568 slaughtered for home consumption, 540,604 slaughtered for selling, and 49,599 died.

The foregoing figures do not include the livestock of Croatia and Slavonia. Results of the census of March 24, 1911, with percentage of increase or decrease since 1895: Horses, 350,036 (12.4 per cent.); mules and asses, 3173 (9.0 decrease); cattle, 1,134,664 (24.9 increase); swine, 1,163,493 (31.8); sheep, 850,161 (42.7); goats, 95,592 (326.4).

MINING AND METALS. In Austria the total value of mining products (exclusive of salt, petroleum, etc.) in 1909 was 317,501,821 kronen and in 1910 315,484,476 kronen; fur-nace products, 137,235,740 and 143,951,194. Quantity and value of the more important minerals in 1910: Coal, 13,773,985 metric tons (139,437,987 kronen); lignite, 25,132,855 (136,116,897); salt, 345,629 (45,065,081); graphite, 33,131 (1,388,052); iron ore, 2,627,583 (23,604,359); silver ore, 23,629 (4,165,951); lead ore, 22,841 (4,090,528); mercury ore, 100,899 (2,373,634); zinc ore, 34,637 (2,282,855). Metal production in 1910 included: Raw iron, 1,504,786 metric tons (valued at 120,233,559 kronen); zinc, 12,458 (6,640,618); lead, 15,476 (5,610,206); mercury, 603 (3,423,455); copper, 1468 (2,018,073). Silver produced was valued at 4,320,021 kronen and gold 580,393.

In Hungary in 1910 the value of the coal output was 16,679,000 kronen; lignite, 71,494,000; raw iron, 40,987,000; iron ore, 13,628,000; gold, 9,960,000; silver, 1079.

COMMERCE. The total special trade in 1911 exceeded that in any previous year, although the value of exports was less than in 1910 or 1907. The following table shows, in thousands of kronen, the trade of the common customs

territory. Imports of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports:

Years	Mdse. Home Consump.	Total Mdse.	Coin and B.	Total Imports
1895	1,444,986	1,487,052	107,659	1,594,711
1900	1,696,358	1,748,968	44,898	1,793,866
1905	2,146,133	2,213,145	55,982	2,269,127
1907	2,501,974	2,587,147	43,839	2,630,986
1909	2,746,331	2,821,261	237,101	3,058,362
1910	2,852,852	2,929,734	43,099	2,972,833
1911	3,191,712	41,414

Exports of domestic merchandise, of total merchandise, of coin and bullion, and total exports have been as follows, in thousands of kronen:

Years	Domestic Mdse.	Total Mdse.	Coin and B.	Total Exports
1895	1,483,620	1,568,118	50,362	1,618,480
1900	1,942,003	2,061,705	66,546	2,128,251
1905	2,243,780	2,390,722	59,533	2,450,255
1907	2,457,286	2,658,085	79,456	2,737,541
1909	2,318,888	2,475,053	128,342	2,603,395
1910	2,418,606	2,587,641	80,931	2,618,572
1911	2,404,303	132,915

Values, in thousands of kronen, of the leading classes of imports for consumption and exports of domestic produce are shown in the following table. The letters indicate: *a* Cotton and its manufactures; *b* wool and its manufactures; *c* cereals, pulse, flour, etc.; *d* coal and other fuel; *e* vegetables, fruits, etc. (exclusive of southern fruits); *f* animal products; *g* iron and steel and their manufactures; *h* other common metals and their manufactures; *i* machines, apparatus, etc.; *j* electrical machinery, apparatus, etc.; *k* vehicles and vessels; *l* instruments, watches, etc.; *m* silk and silk goods; *n* flax, hemp, jute, etc., and their manufactures; *o* colonial produce; *p* leather and its manufactures; *q* chemicals, by-products, etc.; *r* minerals; *s* tobacco; *t* rubber and its manufactures; *u* sugar; *v* cattle and draught animals; *w* apparel, etc.; *x* wood manufactures; *y* glass and glassware; *z* paper and its manufactures; *aa* southern fruits; *ab* comestibles; *ac* beverages; *ad* gums and resins; *ae* turners' and carvers' materials; *af* earthenware; *ag* literary and artistic articles.

Egypt	33,735	35,419	35,112	39,917
Turkey	52,008	33,182	128,757	93,504

Total, including other. 2,852,852 3,191,712 2,418,606 2,404,303

SHIPPING. Entered at the ports in 1910, 190,105 vessels, of 28,235,486 tons (sail, 20,315, of 791,467 tons); cleared, 189,986 vessels, of 28,335,345 tons (sail, 20,229, of 786,247 tons). Under the Austro-Hungarian flag: Entered, 177,305 vessels, of 25,993,866 tons; cleared, 177,237, of 26,094,641 tons. Merchant marine at the beginning of 1911: 510 steamers, of 522,970 tons, and 16,185 sail, of 49,159 tons.

COMMUNICATIONS. Railways in operation in 1911 aggregated 46,088 kilometers, of which 23,070 kms. were in Austria, 21,062 in Hungary, and 1956 in Bosnia and Herzegovina. Of the Austrian lines, about seven-tenths, and of the Hungarian, about four-fifths, are owned or operated by the state. The electrification of the Vienna and Pressburg lines (63 miles in length) took place during 1912, the city portions being worked on the direct-current system and the country portions by alternating current. Telegraphs (1911): Austria, 6970 offices, with 46,952 kms. of line and 235,493 kms. of wire; Hungary, 4592 offices, 25,068 kms. line and 144,124 kms. wire; Bosnia and Herzegovina, 173 offices, 4102 kms. line, and 12,778 kms. wire. Telephone stations (1910): Austria, 110,882; Hungary, 59,885; Bosnia and Herzegovina, 780. Post offices (1910): Austria, 9461; Hungary, 6152; Bosnia and Herzegovina, 172; abroad, 36.

FINANCE. The standard of value is gold, and the monetary unit the kronen, par value 20.263 cents. The cost of administering the common affairs of the monarchy is borne by both governments in a proportion agreed to by their parliaments and sanctioned by the emperor-king. The agreement renewed for ten years in 1907 provides that the net proceeds of the common customs be applied to the common expenditure, and the remaining expenditure be satisfied by Austria in the proportion of 63.6 per cent. and by Hungary 36.4 per cent. The expenditure of the monarchy in 1908 was 514,376,180 kronen (ordinary 394,372,164, extraordinary 120,004,016); in 1909, 643,578,124 kronen (440,391,996 and 203,186,128). Net customs receipts in the two years, 169,931,455 kr. and 197,379,735 kr. The net expenditure, therefore, was 344,444,725 kr. in 1908 and 445,598,389 in 1909; this expenditure, for 1908,

was satisfied by Austria in the sum of 219,066,840 kr. and Hungary 125,377,885 kr.;— for 1909, Austria 283,400,575 kr. and Hungary 162,197,814 kr. Estimated expenditure for 1911, 457,903,864 kr.; for 1913, 503,974,188 kr. (of which 6,024,019 extraordinary). Estimated net customs receipts for 1913, 197,704,169 kr. Estimated departmental expenditures for 1913: Foreign affairs, 18,954,716 kr.; war, 479,511,979 (including marine, 74,757,210); finance, 5,143,953 (including pensions, 4,605,000). By the terms under which the union of Austria and Hungary was effected in 1867, no debts are contracted by the monarchy; the total general debt, contracted before that time, amounted on January 1, 1912, to 5,179,043,911 kr. Distinct from this are large debts contracted by both Austria and Hungary since 1868.

In Austria, revenue and expenditure have been as follows, in thousands of kronen:

	1907	1908	1909	1910
Revenue...	2,253,052	2,388,384	2,883,648	2,895,492
Exp'diture	2,209,093	2,373,894	2,795,703	2,901,364

The budget for 1912 showed estimated revenue of 2,916,685,263 kr. (2,770,393,164 ordinary and 146,597,180 extraordinary); estimated expenditure, 2,916,685,263 kr. (2,668,007,637 ordinary and 248,607,626 extraordinary). The larger items of estimated revenue: Railways, 822,584,010 kr.; excise, 391,947,100; direct taxes, 379,790,000; tobacco monopoly, 318,258,100; posts and telegraphs, 201,305,500. The larger estimated expenditures: Railways, 637,566,780 kr. ordinary and 124,617,930 kr. extraordinary; finance, 861,085,365 and 5,441,700 (including 505,797,962 for public debt); common expense of the monarchy, 338,107,811 and 8,080,126; posts and telegraphs, 162,072,820 and 17,211,720; worship and public instruction, 105,117,244 and 8,196,440; public works, 87,139,930 and 26,085,310; justice, 88,091,286 and 1,247,000; national defense, 100,426,715 and 1,080,595. Provisional estimates for 1913 were 3,137,202,566 kr. revenue and 3,137,481,539 kr. expenditure. On January 1, 1912, the consolidated debt was 6,711,294,746 kr.; floating debt, 350,333,568 kr.; total, 7,061,628,314 kr. (not including Austria's part in the common debt).

In Hungary, revenue and expenditure have been as follows, in thousands of kronen:

	1907	1908	1909	1910
Revenue...	1,395,711	1,531,368	1,750,783	2,074,549
Exp'diture	1,399,477	1,616,245	1,721,564	1,901,666

In 1910 ordinary revenue amounted to 1,543,102,641 kr.; ordinary expenditure, 1,418,776,584; total expenditure included 149,444,732 kr. for sinking fund. The 1912 budget showed estimated revenue 1,852,747,661 kr. (1,667,091,211 ordinary, 185,656,450 extraordinary); estimated expenditure, 1,852,694,998 kr. (including 1,580,378,496 kr. ordinary and 168,877,261 kr. for sinking fund). Larger items of estimated ordinary revenue for 1912: Railways, 427,000,000 kr.; direct taxes, 287,010,000; excise, 270,630,000; tobacco monopoly, 185,267,000; posts and telegraphs, 95,545,000. Larger estimated ordinary expenditures, 1912: Ministry of commerce, 430,221,650 kr.; ministry of finance, 249,592,018; Hungarian debt,

219,642,197; ministry of the interior, 101,112,054; part in the common expense of the monarchy, 101,563,468; ministry, worship and public instruction, 95,093,039; ministry of agriculture, 70,140,526; debt of the monarchy, 60,619,340; ministry of national defense, 62,117,366. Debt in 1910 (not including Hungary's part in the common debt), 5,317,327,796 kr.; in addition, arrears, etc., 927,998,323 kr.; total, 6,245,326,119 kr.

ARMY. On July 5, 1912, a new army bill was officially promulgated designed to increase the personnel, which on a peace strength had been fixed at 305,000 in 1889. The term of service with the colors was reduced from three to two years and the total period of service was increased from ten to twelve years. For cavalry and horse artillery three years with the colors and seven years in the reserve were retained, a proviso which was adopted for the *Landwehr* cavalry. In general, the two years' service was not to be completely established until 1917, but it was to be introduced gradually. The new recruit contingents voted were for the "Common" army, 159,500; Austrian *Landwehr*, 26,996; *Honved*, 25,000; as against 103,000, 20,000, and 12,500 in previous years, working up to the increased strength gradually. See below under *History*.

For the *Ersatz* reserve the initial period of training was determined at ten weeks instead of eight, and there were to be three subsequent yearly trainings, not exceeding a total period of four weeks. The entire service will cover twelve years.

	Present (1912)	1917	Increase
Common army.....	305,914	336,000	30,000
Austrian <i>Landwehr</i>	48,084	55,600	7,500
Hungarian <i>Honved</i>	32,770	51,000	18,000
Total	386,768	442,600	55,500

In 1912 the active army of Austria-Hungary was composed of 17 army corps, comprising 8 cavalry divisions and 36 infantry divisions, with a *Landwehr* division attached to each. In March, 1912, the 2 corps on the Italian frontier were increased and various changes of garrison were made. Four new brigades and 2 additional cavalry divisions were formed at Budapest and Lemberg and 40 sections of machine guns were formed for attachment to infantry battalions. There were in the active army in 1912, 106 regiments of the line, 4 of Tyrolean Rifles, and 26 battalions of Regular Rifles, making a total of 468 battalions, 15 regiments of dragoons, 11 of Uhlans, and 16 of Hussars, making a total of 250 squadrons. The organization of the artillery gives to each army corps 130 field guns, 24 howitzers, and 24 guns for the *Landwehr* division, making in all 178 guns, while on a peace basis the heavy artillery was organized into 28 4-gun batteries of siege howitzers. There were also 40 mountain batteries and 6 fortress artillery regiments.

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1912: Dreadnoughts (battleships having a main battery of all big guns; that is, 11 inches or more in calibre): built, one (*Viribus Unitis*) of 20,010 tons; building, three of 60,030 tons. Predreadnoughts (battleships of about 10,000 or more tons whose main bat-

teries are of more than one calibre): built, 6 of 74,613 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): built, 6 of 41,700 tons; building, none. Battle cruisers: none built or building. Armored cruisers: built, 3 of 18,580 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 4 of 10,332 tons; building, 3 of 10,449 tons. Torpedo-boat destroyers: built, 12 of 4728 tons; building, 6 of 4722 tons. Torpedo boats: built, 40 of 6500 tons; building, 12 of 2928 tons. Submarines: built, 6 of 1686 tons; building, 7 of 4473 tons. Total tonnage: built, 178,149; building, 82,602. Excluded from the foregoing: Ships over 20 years old unless reconstructed and rearmed within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo-depot ships, and other auxiliaries.

The third of the four dreadnoughts was launched November 30, 1912, being christened *Prinz Eugen*; the first is the *Viribus Unitis* (commissioned October 6, 1912), and the second the *Kaiser Franz Josef* (to be completed in the summer of 1913). Primary armament of each of the four, twelve 12-inch guns. Provision was made in the 1912 budget for a total active personnel of 17,277 men. See NAVAL PROGRESS.

GOVERNMENT. Austria and Hungary have each a representative parliament and a responsible ministry appointed by the sovereign. Croatia and Slavonia and each crownland of Austria have separate diets. The common administration is directed, under the constitutional compromise of 1867, by the emperor-king, acting through three ministers, for foreign affairs, finance, and war, who are responsible to the Delegations. These bodies, of 60 members each, represent the Austrian and Hungarian parliaments and convene each year alternately at Vienna and at Budapest. They examine the requirements of the common services and advise the parliaments as to necessary appropriations. The common government deals with finance relating to the monarchy as a whole, foreign affairs, the diplomatic, postal, and telegraphic services, the army, the navy, and certain state monopolies. The sovereign in 1912 was Franz Joseph I., who was born August 18, 1830, and became emperor of Austria December 2, 1848, and king of Hungary June 8, 1867. His nephew, the Archduke Franz Ferdinand, born December 18, 1863, is the heir-presumptive. Common ministry at the beginning of 1912: Premier and minister for foreign affairs, Aloys (Count) Lexa von Aehrenthal (appointed 1906); finance, Stephan (Baron) Burián de Rajecz (1903); war, Gen. Moritz (Ritter) von Auffenberg (1911). Count Lexa von Aehrenthal died February 17 and was succeeded by Leopold (Count) Berchtold, Baron von und zu Ungarschütz. On February 20, 1912, Baron Burián de Rajecz was succeeded by Dr. Leon (Ritter) von Biliński. General von Auffenberg resigned December 9, 1912, and was succeeded by the under secretary, Gen. A. (Ritter) von Krobatin. The navy department is a section of the war ministry; at its head in 1912 was Admiral Rudolf (Count) Montecuccoli.

The Austrian ministry in 1912 (formed November 3, 1911): Premier, Karl (Count) Stürgkh; interior, Dr. Karl (Baron) Heinold von Udynski; worship and public instruction, Dr. Max (Ritter) Hussarek von Heinlein;

finance, Wenzel (Ritter) von Zaleski; commerce, Dr. Rudolf Schuster von Bonnot; railways, Zdenko (Baron) von Forster; agriculture, Fr. Zenker; national defense, Gen. Friedrich (Baron) von Georgi; public works, Ottokar Trnka; justice, Dr. Viktor (Ritter) von Hohenburger; without portfolio, Dr. Ladislás (Ritter) von Dlugosz.

The Hungarian ministry (formed April 17, 1912): Premier and minister of the interior, Dr. Ladislás de Lukács; finance, J. de Teleszky; commerce, Ladislás Beöthy de Bessenyő; agriculture, Count Serényi de Kis-Serény; worship and public instruction, Count Zichy; justice, Dr. Ferencz Székely; national defense, Lieutenant Field Marshal Baron Hazai; for Croatia and Slavonia, G. Josipovich. See BOSNIA AND HERZEGOVINA.

HISTORY

THE REICHSRATH. The Austrian government programme at the beginning of 1912 included the budget and provisions for new taxes to cover the deficit, the new military law, the construction of canals and waterways, appropriations for local railway lines and for certain public works, and various measures of social legislation, including workmen's insurance, an increase of the salaries of civil servants, and a reform of the discipline of the service. When the Reichsrath had adjourned at the beginning of July it had made noteworthy progress in carrying out these plans, despite the difficulties arising from the rivalry of races and from the external political situation. The military reforms which had been urged for twenty years were at length voted (see *New Military Law*), and a statute of functionaries passed the Lower House (see *Statute of Functionaries*). These measures imposed new burdens on the revenues and radical fiscal reforms were required. The Reichsrath did not, however, deal thoroughly with the matter. It admitted the new expenses, but did not accept the new taxes, except provisionally and in part. The essential points in the financial situation were set forth by the former minister of finance, Baron Plener, in the summer. He pointed out that the deficit for 1912 amounted to 112,000,000 or 118,000,000 crowns, and that the public debt had increased by 1,746,000,000 crowns, during the last few years as the result of bond issues which had been so frequent that the market was overstocked and the profit to the government slight. Radical reforms were necessary, but the Reichsrath temporized, contenting itself with provisional arrangements.

THE NEW MILITARY LAW. The military law passed the Austrian Reichsrath after some difficulties, on June 26, and was at length forced through the Hungarian parliament, despite the prolonged obstructive tactics of the minority (see below, *Hungarian Cabinet Crisis*). The German element in the empire had long favored the reform, for the army not only expressed the unity of the state but afforded the basis for the alliance with Germany, and a strong army was required to maintain the national prestige. The measure was especially desired by the emperor, who intervened personally on its behalf. The rivalry between the Poles and the Ruthenians threatened at one time to prevent its passage. In Galicia, the Poles, who outnumbered the Ruthenians, con-

trolled the local government, and the Ruthenians complaining of their oppression demanded autonomy for eastern Galicia. In accordance with the usual practice of the national parties, the Ruthenians threatened to obstruct parliamentary procedure unless the government conceded their demands. When the government promised to do so, the Poles took offense and in their turn began to hamper the government. Upon the assurance of the emperor that he trusted the patriotism of both races, and on his appeal to the Poles for a friendly settlement of affairs in Galicia, the opposition ceased and the law was voted. The law of 1889, which the present measure superseded, fixed the contingent of army recruits at 103,100 for a period of ten years. Though the need of an increase and of a new military organization was manifest in 1899 if Austria-Hungary was to hold her place among her neighbors, the distracted state of the country at that time prevented the desired changes. The new law fixes for a period of twelve years the Austro-Hungarian contingent at 159,000 and increases equally the landwehrs of Austria and Hungary. To lessen the burden on the people, the term of service for the great majority of recruits is reduced from three to two years, the three-year term being retained only for the cavalry and other mounted troops. Naval service was to last four years. These inequalities in the length of service occasioned criticism and the government promised to consider plans for their removal. Important changes were made in the code of military justice, which had become altogether antiquated, having been in force for more than a century. Naturally the financial question raised by these heavy additions to the expenses was a very serious one, and time was required to work out an answer. The minister of war submitted a programme demanding an appropriation of 250,000,000 crowns, but the minister of finance refused, in view of the state of the treasury, to present the demand to the parliaments. The question was adjourned.

STATUTE OF FUNCTIONARIES. During the session that terminated in July, the Reichsrath made progress with the measure for reforming the rules of the civil service and increasing the remuneration of officials. It passed the lower house and was submitted to the upper house. The important point at issue was the right of public functionaries to form unions. The Socialists, who had a hundred votes in the assembly, won others to their side on behalf of this right, and the new measure gave civil servants complete liberty of action in regard to unions, containing provisions on this subject and on the subject of coalition, of which the government disapproved. The latter threatened to refuse to submit the law to the royal sanction if these were not changed. It was argued that they would destroy discipline and play into the hands of the syndicalists. It was expected that the upper house would modify these provisions and that the civil servants would welcome the measure, nevertheless, because of the improvement in their material condition for which it provided.

HUNGARIAN CABINET CRISIS. The crisis in the cabinet arising from the difficulties over the army question led to the resignation of Count Khuen-Héderváry early in March, and serious difficulties in the way of forming a new cabinet soon developed. There was much dis-

trust in Hungary of the policy of the war office, and the war minister, General von Auffenberg, was fiercely attacked in the Hungarian press for his alleged designs on Hungary. The imperial government on the other hand was determined to control the Hungarian contingent of the dual army, and in this was supported by a portion of the public. Count Khuen-Héderváry, to whom the crown entrusted negotiations for opening the way to a new cabinet, found the solution of the difficulty impossible. Both the Justh and Kossuth groups determined to obstruct the measure unless the Hungarian government would commit itself to universal suffrage. Count Héderváry, by way of compromise with the Kossuth group, promised to introduce a resolution accepting the principle that the reservists could not be made to serve with the colors in time of peace unless parliament had granted the annual levy. This, however, was offered without the crown's assent, and the imperial government refused to accept it, whereupon the Héderváry cabinet resigned (March 7), but was asked to retain office temporarily. The relations between Austria and Hungary were at a deadlock, the emperor threatening to abdicate if the principle of imperial control over the Hungarian forces were denied. Toward the end of March Count Héderváry declared that while the Hungarian government's views had not altered, it could not act upon them, since such a course would result in the emperor's abdication. The resignation of the ministry was recalled, but, further difficulties arising, it resigned again on April 17. Dr. de Lukács was then chosen as minister-president to succeed Count Khuen-Héderváry, and it was understood that he would find means of coming to terms with the Kossuth party; but he was soon at odds with the opposition over the military and franchise questions. The Justh group declared that his policy was no more favorable to universal suffrage than that of his predecessor. In May the suffrage agitation led to rioting in Budapest. On June 4 the army bill was at length carried through by the strong measures of Count Stephen Tisza, who had been elected president of the lower house. Finding it impossible to proceed on account of the disturbances in the house, he summoned the police to keep order. Members of the opposition used the most violent language and M. de Justh was particularly bitter and abusive, denouncing Count Tisza as a scoundrel and usurper. On June 7 the violent scenes of the previous session were repeated and culminated finally in an attempt on the life of Count Tisza. After the opposition had taken their seats, despite the ruling of Count Tisza that they should be excluded, they were surrounded by 150 constables, and upon their continued refusals were removed, one by one. After they had gone, Count M. Kovács, who had remained behind, shouted that a member of the opposition was still there and fired several shots at Count Tisza from a revolver. The bullets struck in the woodwork of the presidential tribune at which he was sitting. Kovács was immediately attacked by the other members and carried out unconscious. Popular demonstrations against the government occurred and it was clear that public opinion was decidedly against the arbitrary methods employed by the government. The feeling against Count Tisza was so strong that he did

not venture for some time to go out into the streets. When he did appear in public, on June 15, he was surrounded by a mob and narrowly escaped violence. The police were obliged to intervene.

On the reopening of the parliament on September 17 the riotous scenes were repeated. The opposition deputies blew on horns, beat drums and cymbals, fought with their rivals and with the police. On the following day, when they attempted to renew the pandemonium, the sitting was suspended and the police summoned, whereupon the opposition members left the house. The session was then reopened and the government majority voted the exclusion of the opposition deputies. After voting the Delegation the house adjourned.

RACE QUESTIONS. The conflict between the Germans and Czechs in Bohemia had for four years checked the activities of the Bohemian Diet, thrown the administration into confusion, and resulted in a financial deficit which prevented the payment of salaries of many classes of public officers and the carrying out of necessary public works. An adjustment of some sort was absolutely necessary if the functions of government were to be performed and negotiations toward a compromise were carried on in the summer of 1912. The government used all possible means to prevent their failure. The chief features of the proposed compromise were as follows: The Czechs, while maintaining their traditional principles of an undivided Bohemia, were to concede to the Germans a certain measure of administration, as the price of political peace. In the German districts judicial and administrative officers were to be of that race, and the rule as to the two languages was to be determined by local law for the officials of the autonomous districts and by imperial law for the state officers. The Bohemian budget would be divided between the two nationalities and there would be two sets of rules for civil servants. The law was to protect the rights of that race which in any locality was in a minority. By July the prospect for the restoration of peace in Bohemia seemed promising. Another race difficulty was the recent movement of the southern Slavs, that is, the Croats, Slovenians, and Serbs, for separation from Austria and Hungary and the creation of a southern Slavic empire, thus turning the dual into a triple monarchy. This movement had gathered force ever since the annexation of Bosnia and Herzegovina. Croatia has long desired to cut loose from Hungary and absorb the Croats of Istria and Dalmatia. The Slovenians prefer a union with the Croats to inclusion in the Austrian kingdom, and the Serbs of Austria and those on the Servian frontier would, in spite of their present rivalry, welcome the new arrangement. Bosnia-Herzegovina would also form a part of the new federation. Though the realization of this purpose seemed far off, the movement has gained strength from the economic development of those countries, which tends to make them more independent financially. In Croatia the Hungarian government has had to repress agitation with violent measures. Croats, Serbs, and Slovenians have protested against these measures of oppression, and the Diet of Bosnia has expressed its sympathy with their kinsfolk in Austria and Hungary. The events in the neighboring Turkish provinces added to the danger and the development was naturally

watched with interest in Montenegro and Servia. In 1912 this southern Slavic movement was in fact one of the most serious questions before the state.

DISTURBANCES IN CROATIA. At the end of February serious disturbances occurred at Agram, where the feeling ran high against the government and against Hungary. Much damage was done to property and a number of policemen were wounded. Many arrests followed. The immediate cause of the outbreak was the arrest of a former opposition deputy, who was condemned to three months' imprisonment for having signed his client's name to an election petition. Throughout the Slav provinces of the south the feeling against Hungary was very bitter. Early in April the appointment of the new ban, M. Cuvaj, as royal commissioner for Croatia and Slavonia, with dictatorial powers, was announced. In his proclamation he declared that the activity of the Diet was suspended and the arrangement for the Diet elections was stopped. Restrictions were placed on the press and the right of free assembly was provisionally suspended. The previous Diet had been dissolved at the end of January, owing to its conflict with the government, and it was feared that the new Diet would be no more practicable than the old one. The Czech parties at a meeting at Prague on April 8 expressed sympathy with the Serbs and Croats for their defense of their national rights against the Magyar government of force, and declared their belief that the struggles of Czechs, Serbs, and Croats would ultimately lead to an independent Czech kingdom in the north and an independent Croatia in the south.

There was bitter opposition against the arbitrary rule in Croatia and members of the Reichsrath in April were inclined to urge the Austrian government to intervene on behalf of Croatia against the new ban. An attempt was made to assassinate the ban on June 8 by a Bosnian law-student of Agram University, who fired at him on the street and mortally wounded his companion, M. Hervovich, a prominent Croatian official. A trial for alleged conspiracy at Agram in the summer had features in common with the Agram high treason trial of 1909, and was characterized by the press as equally farcical. A number of youths were involved, and in August one of them was sentenced to death, seven were sentenced to varying terms of imprisonment, and four were acquitted. The sentence aroused much indignation in Croatia and was regretted by a portion of the Austrian press. Appeal was taken to a higher court.

FOREIGN AFFAIRS. Count Aehrenthal, the foreign minister, died at Vienna on February 17. Almost up to the moment of his death there had been a bitter campaign against him in which many many persons of great political influence were said to be concerned. The ground of the attacks was his failure to give adequate return to Germany for her support during the annexation crisis, and his opposition to the chief of the general staff in his efforts to strengthen Austrian defenses in view of the increasing number of Italian troops on the Austrian border. He resigned in January on account of illness, and in the following month, there being no hope of his recovery, his resignation was accepted. He was succeeded by Count Berchtold, the first Hungarian to hold

the office in more than thirty years. On April 30 the latter made an outspoken declaration as to the imperial foreign policy before the Hungarian delegation committee. After affirming his loyalty to the principles of Count Aehrenthal, he declared that they would maintain unswervingly the triple alliance, and that their friendly relations with the German empire and with Italy remained unchanged. The extension of the Italian naval campaign to the Aegean and the closing of the Dardanelles had caused much alarm and the government brought to the attention of Turkey the disadvantages involved in closing the straits. It was hoped that the measure would be repealed when danger to the Dardanelles had ceased. The emperor received visits from the Russian Grand Duke Andrew Vladimirovich in February, the Emperor William of Germany in March, and King Nicholas of Montenegro and King Ferdinand of Bulgaria in June. Count Berchtold conferred with the German chancellor at Buchlau in September, with the King of Italy and his foreign minister at Rome in October, and with the German and Italian ambassadors at Budapest in November. For further details as to Austro-Hungarian diplomacy, see **TURKEY AND THE BALKAN PEOPLES**.

MISCELLANEOUS. Hungarian Socialists proclaimed on May 22 a general strike for the following day as a demonstration for universal suffrage. Some disorders occurred at Budapest on account of the government's prohibition of open air meetings.

AUTOMOBILES. The remarkable increase in the use of automobiles which has characterized the years since their practical perfection, continued in 1912. According to figures compiled by *The Automobile*, the total number of cars registered at the end of 1912 was 1,010,483. This figure, however, includes duplicate registrations amounting to 15,345. The largest number of motor vehicles registered in any State was in New York, 105,546. California follows with 88,699; Illinois, 68,073; Ohio, 63,066; Pennsylvania, 59,357; Indiana, 54,334; and Massachusetts, 51,229. The smallest number registered was in Nevada, 900. The registration in 1911 was in round numbers, 677,000, showing that the registration nearly doubled in 1912. The total number of motor vehicles of all kinds produced in 1912 was 378,261, compared with a production of 209,957 in 1911. The production of various classes of cars in 1912 was as follows: Gasoline cars, 340,746; gasoline trucks, 27,909; electric cars, 8013; steam cars, 850; electric trucks, 743.

The increased popularity of low-priced cars is shown by the fact that there were produced in 1912 177,563 cars to sell at \$1250 and less. Cars made to sell from \$1250 to \$2000 numbered 100,444. Cars made to sell between \$2000 and \$3000 numbered 68,891, and those amounting to more than \$3000, 31,362.

There were exported in the first eleven months of 1912 23,089 automobiles, valued at \$23,998,351. The largest number were exported to Canada, 6864; to the United Kingdom, 4371; to British Oceania, 3112; to South America, 1859. The number imported during the same period was 1795, valued at \$1,974,496.

The increase in the use of motor trucks continued in 1912. There were manufactured in 1912 27,909 gasoline motor trucks, compared with 8500 in 1911. There were 743 electric trucks made, compared with 553 in 1911. In

1912 there were produced 200 gasoline fire trucks, compared with 105 in 1911.

RACING EVENTS. Ralph de Palma is clearly entitled to be called the champion driver of 1912. He started in more road races and is credited with more victories than any other driver. He won the Vanderbilt Cup race, the light car race at Santa Monica, the Elgin National Trophy race and the Elgin free-for-all contest. "Teddy" Tetzlaff ranked second to de Palma in number of wins, capturing the Santa Monica free-for-all, the Tacoma heavy car race and the Tacoma free-for-all event. Other drivers of the year deserving special mention are "Joe" Dawson, who in a National car averaged 78.72 miles an hour for 500 miles, a new record for sustained speed on a specially built course, and "Bob" Burman, who in a Blitzen Benz made a new world's record for one mile of 47.85 seconds on a circular dirt track at Brighton Beach.

A noteworthy feature of the year's sport was that no fatal accidents occurred in the twenty principal races. One driver, David L. Bruce-Brown, however, was killed while training at Milwaukee and his mechanic was so badly injured that he died a week after the accident. Bruce-Brown was the winner of the Grand Prize race in 1910 and 1911.

The premier racing honors were won by foreign cars much to the disappointment of the American manufacturers. In the Grand Prize, the Elgin, the Vanderbilt, the Santa Monica, and the Tacoma races, foreign machines were the victors. Two cars showed marked superiority in road events. These were the Fiat and the Mercedes. The Fiat finished first four times and second once in twelve starts, while the Mercedes captured three firsts and one third in the same number of starts. Tetzlaff drove a Fiat car and de Palma a Mercedes.

A summary of the principal racing events in the United States follows: Vanderbilt Cup Race, 299.54 miles, won by de Palma in a Mercedes, 4 hours, 20 minutes, 31.54 seconds, average 69 miles per hour; H. Hughes second in a Mercer; S. Wishart third in a Mercedes. Elgin National Trophy, 254 miles, won by de Palma, 3 hours, 43 minutes, 26 seconds, average 68.4 miles per hour; R. Mulford second in a Knox; Merz third in a Stutz. Elgin Free-for-all, 305 miles, won by de Palma, 4 hours, 28 minutes, 36 seconds, average 70.01 miles per hour; Bergdoll in a Benz second, Mulford in a Knox third. Grand Prize, 409.79 miles, won by Bragg in a Fiat, 5 hours, 59 minutes, 25 seconds, average 69.3 miles per hour; Bergdoll in a Benz second, Anderson in a Stutz third. Santa Monica Free-for-all, 303 miles, won by Tetzlaff, average 78.5 miles, per hour; Bragg second in a Fiat, Bruce-Brown third in a Benz.

In the Grand Prix Race at Dieppe, France, Bouillet covered 956.63 miles in 13 hours, 58 minutes, 23½ seconds, an average of 68 miles per hour. Zuccarelli won the Grand Prix race for light cars, 402.4 miles, at Le Mans, France. His time was 6 hours, 12 minutes, 22 seconds. The event for heavy cars was captured by Goux, whose time for the same distance was 5 hours, 31 minutes, 54 seconds.

The most important new records made in 1912 follow: Speedway, 3 kilometers, Bragg in a Fiat, 1 minute, 54.83 seconds; 100 miles, Tetzlaff in a Fiat, 1 hour, 13 minutes, 37.25 seconds; 150 miles, same driver and car, 1:49:52.84; 200 miles, same driver and car, 2:25:59.52;

250 miles, same driver and car, 3:7:13.94; 300 miles, same driver and car, 3:48:49.3; 350 miles, same driver and car, 4:25:15.27; 400 miles, same driver and car, 5:4:14.23; 450 miles, same driver and car, 5:44:4.54; 500 miles, same driver and car, 6:21:6.03. One mile circular track—1 mile, Burman in a Blitzen Benz II., 47.85 seconds; 2 miles, Oldfield in a Christie, 1:35:89; 3 miles, Disbrow in a Simplex, 2:27.81; 4 miles, same driver and car, 3:17.02; 5 miles, same driver and car, 4:6.58; 10 miles, same driver and car, 8:17.02; 15 miles, 13:3; 20 miles, same driver and car, 17:57.4; 25 miles, same driver and car, 22:26.6; 75 miles, Wishart in a Mercer, 1:15:52.5; 100 miles, same driver and car, 1:40:51; 150 miles, same driver and car, 2:30:51; 200 miles, same driver and car, 3:28:4.5.

AUTOMOBILE FIRE APPARATUS. See FIRE PROTECTION.

AVERY, ROBERT. An American soldier and lawyer, died October 1, 1912. He was born in Tunkhannock, Pa., in 1839 and was educated at Wyoming Seminary. At the outbreak of the Civil War he went to the front as captain in the 102d New York Infantry in 1863. He was promoted to be lieutenant-colonel and was brevetted lieutenant-colonel of volunteers on March 13, 1865, for gallant services at Chancellorsville, where he commanded the right wing of the Second Army Corps and where he was shot through the neck. For services on Lookout Mountain he was brevetted colonel and brigadier-general. In the latter battle he lost his right leg. After the war he was sent to Raleigh, N. C., as judge advocate to assist in the work of reconstruction. In 1870 he was admitted to the bar and practiced law in New York City. He was a director in several industrial corporations and in railroads.

AVIATION. See AERONAUTICS; MILITARY PROGRESS and NAVAL PROGRESS.

AVIETTES. See AERONAUTICS.

AYCOCK, CHARLES BRANTLEY. Former governor of North Carolina, died April 4, 1912. He was born in Fremont, N. C. He studied law and engaged in its practice at Goldsboro, N. C. From 1893 to 1898 he was United States district attorney. In 1901 he was elected governor of the State, serving in that office until 1905.

AYME, LOUIS HENRI. An American public official and scientist, died May 16, 1912. He was born in New York City in 1855 and graduated from Columbia College in 1874. He studied medicine for a short time and then became scientific assistant on the United States Transit of Venus Expedition to New Zealand in 1874. From 1880 to 1884 he was United States consul at Merida, Yucatan, Mexico, and in the two years following was ethnologist of the Smithsonian Institution in Oaxaca, Mexico. From 1886 to 1891 he was on the staff of the Chicago *Inter Ocean* and served for the next five years on the staffs of several Chicago papers. In 1898 he was appointed consul at Guadaloupe and in 1903 at Para, Brazil. In the latter year he became consul-general at Lisbon, Portugal. He was well known as an archæologist and was a member of many American and foreign learned societies. He was the author of *Notes on Milla* (1882), and in 1896 was associate editor of *Elliott's Magazine*, Chicago. He contributed scientific and archæological articles to many magazines.

BACILLUS CARRIER. See TYPHOID FEVER.

BACON, FRANCIS. An American surgeon, died April 26, 1912. He was born in 1831 and graduated from the Yale Medical School in 1851. In the following year he distinguished himself in a yellow fever epidemic which broke out in Galveston and he himself was stricken with the disease. At the outbreak of the Civil War he became surgeon of the Second Connecticut Volunteers. He served throughout the war and was promoted to be medical director of the Army of the Potomac and afterwards to the same position in the Department of the Gulf. From 1865 to 1877 he occupied the chair of surgery in the Yale Medical School. He was an authority on yellow fever.

BACON, HENRY. An American artist, died March 14, 1912. He was born in Haverhill, Mass., in 1839, and later removed with his family to Providence and afterwards to Philadelphia. He enlisted in the Federal army at the age of 18, and became field artist for *Leslie's Weekly*. He served in the war until he was wounded. After its close he went to Paris to take up the study of art. He remained in that city for twenty years, studying under Frère and Cabanal. Several of his pictures were hung in the salon. After leaving Paris he went to London and for several years lived in Chelsea in the house once occupied by Thomas Carlyle. Although he was successful in oil painting, his watercolor pictures brought him first into prominence. For several years he spent his winters in Cairo, Egypt, making excursions with caravans into the desert, gathering material for the watercolor pictures of caravan life and desert scenes which chiefly made him famous. Some of his pictures are in the collections of J. P. Morgan and Henry Walters. One of his best-known pictures is that of "General Gates and the Boys of Boston Common," which hangs in the Adams House in Boston.

BAGDAD RAILWAY. See TURKEY.

BAHAMAS. The most northerly of the British West Indian colonies; a chain of about 20 inhabited islands and numerous islets and rocks. Total area, 4403½ square miles; population (1911), 55,944 (of whom 13,554 in the island of New Providence.) Nassau is the capital. Sponges are the principal export (£110,740 in 1910), the export of salt herring declined from £2470 in 1890 to £96 in 1910; preserved fruits (£9219 in 1910), pineapples, oranges, and grapefruit are other products. Area planted (1910) to sisal, over 20,000 acres; export, 6,296,687 pounds, valued at £42,057.

	1907	1908	1909	1910
Imports ...	£372,937	£369,490	£343,489	£329,014

BANG, HERMAN JOACHIM. A Danish author, died in January, 1912. He was born in the Island of Seeland in 1857. He was educated at the Academy of Sorø and at Copenhagen. He was the author of many popular novels, short stories, and romances. Among the best known of his writings are the following: *Haa bløse Slægter* (1880); *Fædra* (1883, dramatized as *Ellen Urne*, 1885); *Excentriske Noveller* (1885); *Stille Eksistenser* (1886); *Tine* (1889); *Under Aaget*, a collection of novels (1890); *Teatret* (1892); *Ludvigsbakke* (1896); *Udvalgte Fortællinger* (1899); *Liv og Død* (1900), and *Mikæl* (1903).

BANKS AND BANKING. In addition to the matter found in this article, which deals primarily with the condition of all banks in the United States and with the subject of banking reform, there will be found elsewhere articles as follows: NATIONAL BANKS; STATE BANKS; SAVINGS BANKS; POSTAL SAVINGS BANKS; LOAN AND TRUST COMPANIES; AGRICULTURAL CREDIT; CURRENCY REFORM; CLEARING HOUSE; and FINANCIAL REVIEW.

RESOURCES AND LIABILITIES. The aggregate resources of 25,194 banks about June 14, 1912, as reported by the Comptroller of the Currency, were \$24,986,000,000. The reporting banks included 7372 national, 13,381 State, 630 mutual savings, 1292 stock savings, 1410 loan and trust companies, 1110 private banks. The aggregate resources represented an increase of \$5,403,000,000 over 1908, or an increase of 27.5 per cent. The aggregate was distributed among the various classes of banks as follows: National, 41.2 per cent.; State, 15.6 per cent.; mutual savings, 15.6 per cent.; stock savings, nearly 4 per cent.; loan and trust companies, 20.4 per cent., and private banks, less than 1 per cent. The resources included loans and discounts of \$13,953,000,000. Of these, 24 per cent. represented loans secured by real estate and 31 per cent. those secured by other collateral. National banks were credited with 42.7 per cent. of all loans and discounts, State banks with 18 per cent., and loan and trust companies with 19 per cent. The resources also included bonds and other securities to the value of \$5,359,000,000. The principal item under liabilities was individual and savings deposits, aggregating \$17,024,000,000. Of these, 34.2 per cent. were in national banks, 17.2 per cent. in State banks, 21.2 per cent. in mutual savings banks, and 21.6 per cent. in loan and trust companies.

Compared with 1908, loans and discounts had increased 33.8 per cent. and individual deposits 33.1 per cent.

The geographical distribution of the banks was as follows: New England States 1983, with total resources of \$3,077,000,000; Eastern States 2901, with \$10,441,000,000 resources; Southern States 6096, with \$2,355,000,000 resources; Middle Western States 8383, with \$6,150,000,000 resources; Western States 5003, with \$1,179,000,000 resources; Pacific States 1721, with \$1,728,000,000 resources, and Island possessions 35, with \$78,000,000 resources. There were six States with aggregate banking resources of more than \$1,000,000,000 each: Massachusetts, New York, Pennsylvania, Ohio, Illinois, and California. The aggregate resources of the 929 banks of New York State were \$6,680,000,000. There were eight States with more than 1000 banks each: Pennsylvania, Texas, Ohio, Illinois, Minnesota, Iowa, Missouri, and Kansas.

The individual and savings deposits of Massachusetts banks aggregated \$2,284,000,000; of New York banks, \$6,479,000,000; of Pennsylvania banks, \$2,176,000,000; of Illinois banks, \$1,401,000,000; of Ohio banks, \$1,077,000,000, and of California banks, \$1,085,000,000.

BANKING POWER. The banking power of 28,995 United States banks, partly estimated, was \$22,548,000,000. This represented an increase of nearly \$5,000,000,000 in four years. The banking power as thus estimated is based on capital, surplus, deposits, and circulation.

NEW YORK CITY DEPOSITS. The investigations of the Pujo committee (see MONEY TRUST) showed that the deposits of 19,000 country banks, with New York City banks, on November 1 amounted to \$483,373,000; these banks had themselves made call loans in New York City amounting to \$240,480,000. During the preceding four months these out-of-town deposits had diminished by \$67,000,000, whereas the out-of-town direct call loans had increased by about \$100,000,000. This phenomenon was explained by the high money rate prevailing in the fall. Since this is an annual change, the explanation seemed correct. The New York banks pay 2 per cent. on deposit accounts; they then use these deposits to make call loans. This situation proved of first importance for the general stability of credit at the time of the panic of 1907. Thousands of interior banks made a call for the immediate return of their deposits. Although the New York banks were able to satisfy this demand to the extent of at least \$75,000,000 within a few days, nevertheless the credit facilities at New York shrank by several hundred million dollars. Thus at the very time when credit was most needed it diminished by an enormous sum at the very centre of financial operations. There were those who blamed this situation upon the operations of the stock exchange. They even advocated either the closing of that exchange, or the prohibition of call loans, or of deposits by interior banks with New York banks. On the other hand, it was argued that the deposit of reserves by interior banks with central reserve city banks was essential to the credit operations of the country; that the call loan market was an advantage in that it provided a use for money at low rates that would otherwise be idle; that the interior banks would

suffer most by prohibitions mentioned, and that the true remedy is in the provision of an elastic bank-note system whereby bank credits may be made to expand and contract with the volume of business.

BANKING AND CURRENCY REFORM. For many years, and particularly since the panic of 1907, there has been general insistence in business, banking, and academic circles that a reform of banking and currency systems is imperative. The Aldrich-Vreeland act of 1908, in addition to establishing a temporary means for meeting most obvious needs, created the National Monetary Commission, which was authorized to make a thorough investigation of banking and currency methods throughout the world and to recommend legislation. It was quite generally agreed that the principal defects in the American financial system were the lack of elasticity in bank-note issues and the lack of coöperation or central control. The lack of elasticity has been due to the fact that bank notes are issued only on the basis of United States bonds. There is thus a lack of correlation between the increase and decrease of bank currency and the rise and fall of business demands, whether seasonal as for crop movements, or extraordinary as in times of panic. Indeed, national bank issues have often been perversely elastic, expanding in times of easy money and contracting in times of money stringency. It has, therefore, been argued that American bank notes should be issued on the basis of general banking assets, as is almost universally the case elsewhere. Thus commercial paper representing actual business transactions and securities representing sound industrial values would be made available for the issue of bank credit to meet legitimate business needs. Experience elsewhere shows that, the need having been satisfied, the notes return for retirement.

The lack of coöperation or central control has resulted in undue shrinkage of credit in times of panic, improper banking methods, undue tendencies to speculation, and lack of means of regulating the importation and exportation of gold. The more than 25,000 banks have been operating under a system of individualism which has imposed upon each the necessity of protecting its own credit. The banking reserves, amounting to more than \$1,500,000,000, have been widely scattered and have not been available to meet real business needs in time of urgent stringency. With every decline in confidence there has been a scramble for gold reserve everywhere, so that the power to extend credit has disappeared just when most needed. It has been argued, therefore, that some scheme for pooling reserves should be devised so that the united strength of all the banks could be brought to bear upon weak points. Moreover, it is believed that something comparable to the control exerted by the city clearing house over its members should be developed in the nation at large. Such control is exerted in European countries by the central banks and in Canada by the few large banks over their many branches.

THE ALDRICH BANK PLAN. *Organization.* On January 8 the scheme of banking and currency reform elaborated by the National Monetary Commission was presented to Congress. Under various tentative forms this scheme had been presented to the country in 1911 and became known as the Aldrich plan. Late in 1911 it

received the unqualified indorsement of the American Bankers' Association and of banking associations in about two-thirds of the States. The discussion of it in 1912 was continuous but somewhat overshadowed by the political campaign. This plan was designed to meet the weaknesses above outlined and to adapt to American conditions the best features of European central banks. It provided for three sets of organizations, each resting upon the one below, culminating in the National Reserve Association. Local banks, at least ten in number, with combined capitalization, including surplus of at least \$3,000,000, were to form local associations having corporate powers. All banks, whether national or State, including trust companies, meeting certain conditions were made eligible to membership in the local associations by purchasing stock equal to 20 per cent. of their capital in the National Reserve Association. Exactly and only this number of shares must be purchased and they were not transferable. The functions of the local associations would be to choose directors for themselves and for the next grade of organization, known as district associations, supervise members somewhat as clearing houses do, and at times guarantee commercial paper to be rediscounted by the central association. The method of choosing directors was elaborate, being ostensibly designed to prevent centralization of control. There were two methods of voting. One by the banks individually, each bank one vote, the other on the basis of shares in the National Reserve Association. Three-fifths of the directors of the local associations were to be chosen by the first method and two-fifths by the second. This would give the small banks a predominant influence in such elections.

The numerous local associations thus formed were to be grouped into fifteen district associations, the number to be altered as conditions demanded. The number of directors of such associations was to be double the number of local associations included in the district. Each local board of directors was to choose one director for the district. Two-thirds of the remaining directors were to be chosen by the second method noted above, each bank voting according to the number of its shares. The other directors were to be chosen by these five-sixths and were to represent agricultural, commercial, and industrial interests. The managers and deputy managers of the district associations were to be appointed by the executive committee of the national associations. The district associations were to choose the national directors, facilitate domestic exchanges, and otherwise to act as the agents of the central body and facilitate its coöperation with the local banks.

The principal feature of the whole scheme was the National Reserve Association, having a capital of at least \$200,000,000. Its directors were to number forty-six; of these one was to be chosen by the board of each of the fifteen district associations. A second group of fifteen similarly chosen were to represent the agricultural, commercial, industrial, and other than banking interests of the district, and were not to be officers or directors of banks or other financial institutions. Nine additional directors were to be chosen by voting representatives chosen by the boards of directors of the vari-

ous branches, each casting votes equal to the shares in the National Reserve Association held by the banks in the branch association which he represented. Finally there were to be seven ex-officio members: The governor, two deputy governors, the Secretary of the Treasury, the Secretary of Agriculture, the Secretary of Commerce and Labor, and the Comptroller of the Currency. The important body of the national board of directors was to be an executive committee of nine members, including the governor, the two deputy governors, the Comptroller of the Currency, and five other directors. The governor was removable only by a two-thirds vote of the board of directors for cause. The national association was given an extensive group of powers and duties, including control of branches; power to establish branches abroad; to act as the fiscal agent of the government; to buy and sell government and State securities of foreign governments, and gold coin and bullion; to deal in bills of exchange, both foreign and domestic; to fix the rate of domestic exchange; to discount bills of exchange arising out of commercial transactions and indorsed by a depository bank and made at least thirty days previously, provided the total amount thus rediscounted for any bank should not exceed the capital of such bank, and also provided that notes and bills bearing the signature or indorsement of any one person or firm should not aggregate more than 10 per cent. of the capital and surplus of the applying bank.

Elasticity. The Aldrich plan aimed to secure the desired elasticity in note issues and the extension of credit by a new system of note issue, new regulations for the rediscounting of commercial paper, and the reserve regulations of the national association. It provided that all note issues in excess of \$900,000,000, but less than \$1,200,000,000, not covered by an equal amount of legal money on hand, should be taxed at the rate of $1\frac{1}{2}$ per cent. annually; and all issues exceeding the latter amount at the rate of 5 per cent. An important part of the plan was the retirement of the existing bond secured circulation of the national banks. It was provided that the National Reserve Association should purchase at not less than par the 2 per cent. bonds now held by national banks to secure their circulation. The association thereupon was to assume responsibility for redeeming the notes issued thereon, replacing them with its own notes. National banks were not required, however, to sell their bonds; but if they retired any part of their notes they could not reissue them. The bonds thus purchased by the Reserve Association were to be exchanged for a new series of 3 per cent. fifty-year government bonds bearing an annual tax of $1\frac{1}{2}$ per cent. The government was to have the option of retiring these bonds or of purchasing them at par for postal savings banks. It was believed that these features in connection with the discount characteristics of the plan would make the note issues responsive to business needs.

The plan provided that the great amount of legal money now held in the thousands of individual banks as a necessary legal reserve would be deposited with the National Reserve Association; instead of being idle, as it is now for the most part, it would thus become available for the rediscounting of paper presented

by the member banks. These latter could rediscount their paper in several different ways, either directly or under the guarantee of their local association. Whenever any bank thus secured credit with the central association it was to be allowed to count such credit as a part of its legal reserve. In addition, association notes, which would soon replace national bank notes, were to count also as legal reserve. In this manner the individual banks would find their ability to care for the business paper of their respective communities at least doubled.

As to reserves, the plan provided that all demand obligations, including deposits of banks and the government, as well as outstanding notes, should be covered by a reserve of 50 per cent. in gold or other legal money. The remaining 50 per cent. might be represented by bills of exchange and discounted paper. If the amount of gold in the reserves should fall below 33 $\frac{1}{3}$ per cent. of the note issues no more notes were to be issued. Moreover, if the gold and legal money held in reserve ever fell below 50 per cent. of outstanding notes a tax of $1\frac{1}{4}$ per cent. annually upon each $2\frac{1}{2}$ per cent. or fraction thereof of such deficiency was imposed.

The National Reserve Association was not to be a profit-making institution. The plan provided that stockholders or member banks should receive a 4 per cent. cumulative dividend. Profit beyond 4 per cent. was to be divided as follows: One-half to the surplus of the association itself; $\frac{1}{4}$ to the United States government by way of compensation for the use of government deposits, and $\frac{1}{4}$ to the stockholders or member banks until they should have received 5 per cent. in all. If there was an excess of profits beyond this latter amount this was to be divided equally between the government and the Reserve Association until the latter's surplus equaled 20 per cent. of the capital, after which all this excess was to go to the government.

Advantages. The advantages claimed in the Aldrich plan may be indicated by the defects of the present condition which it sought to remedy: No plan for concentration or mobilization of reserves for use in times of stress; lack of means for replenishing reserves or for increasing lending power in times of stress; the inelastic bond-secured notes; no coöperation among banks, especially outside of clearing-house cities; no effective agency for exchanges between different parts of the country, especially in times of financial distress; no effective agency for handling foreign exchanges, especially in times of panic; lack of standardized commercial paper, leading to the accumulation of reserves in central reserve cities, thus causing speculation there and checking agricultural, industrial, and commercial development elsewhere; the inequality of credit facilities in different parts of the country; need of greater uniformity, steadiness, and reasonableness of rates of discount; need of elastic credit for crop movements; the need of uniform banking standards, especially as to capitalization, reserve, examinations, and reports; the need of American banks abroad to develop our trade; inability of national banks adequately to serve farmers because they cannot lend on real estate; and the existence of the independent Treasury, causing fluctuations in the money supply and leading to favoritism in the dis-

tribution of government funds to depository banks.

Disadvantages. The principal source of opposition to the Aldrich plan, in so far as it was expressed, was due to the fear that the National Reserve Association would obtain a dominating position in American finance and industry. It was pointed out that, though the manner of election of directors was designed to place the small banks in a position of special power, not only would the majority of directors be bankers but, as at present, small banks would be largely controlled by reserve city banks upon which they are dependent for extensions of credit. It was held that the plan did not sufficiently safeguard against the acquisition of control by purchases of stock by large banks or by holding companies. Thus the whole institution would not only become a bankers' bank but might gradually come under the control of the larger banking institutions centralized in Wall Street. This fear was aggravated by certain findings of the Pujo committee (see *TRUSTS, Money Trust*), revealing the tremendous power in a system of interlocking directorates and other forms of combination. It was argued that the scheme would not be acceptable to the American people until provision was made for greater security against control by any centralized financial group, for greater representation of agricultural, industrial, and commercial interests, and for greater responsibility to the public. President Taft in his annual message declared that the government might be given a larger representation in the executive committee without any danger of injecting politics into its management. It was also widely believed that the plan did not adequately guard against the possibilities of inflation. It was argued that one of the chief causes of our periodic industrial depressions is the over-expansion of business credit and the undue enlargement of productive agencies. Since the Aldrich plan provided that the notes of the Reserve Association could be counted as reserve by member banks, as could also the credit of such banks with the central association, it was argued by some that not only would banks be able to double their credits but even to multiply them many fold. Consequently, in the effort to provide elasticity to meet the exceptional needs of a crisis, it was held that the formulators of this plan had gone to the extent of laying the basis of an unprecedented era of speculation to be followed by a collapse equally monumental. Those favoring the plan made much of the argument that it was really an extension of the principles of the clearing-house which had often proved of highest importance in times of panic. Opponents, however, contended that the clearing-house advantages could be secured by some scheme of coöperation among the banks of different sections, preferably by admitting country banks to membership in the clearing-house associations of nearby cities; it would not thus be necessary to go the full extent of centralization. In this manner, which would be comparable to the Aldrich plan with the Central Reserve Association, the advantages of coöperation could be secured without the manifest dangers of centralization.

BANKS, NATIONAL. See **NATIONAL BANKS.**

BAPTISTS. According to the *American Baptist Year Book* for 1912, the total number

of communicants in the Baptist denomination in 1912, in North America was 5,637,953 and the total number in the world was 6,482,046. In the United States the denomination is divided loosely into two main bodies, the northern and the southern. In addition to the regular Baptist denomination there are several other bodies, of which the most important are the following: General Baptists, 33,600 communicants, 545 churches, 550 ministers; United Baptists, 13,698 communicants, 196 churches, 260 ministers; Primitive Baptists, 10,311 communicants, 2922 churches, 1500 ministers.

In addition there are several small bodies, including the Seventh Day Baptists, The Two Seed in the Spirit Baptists, Church of God and Saints of Christ.

The Northern Baptists have 1,211,426 communicants with 9715 churches and 8223 ministers. The regular Southern Baptists have 2,304,724 communicants with 22,795 churches and 14,635 ministers.

Among the general societies supported by the denomination are the American Baptist Foreign Mission Society, which has general charge of the foreign missions, the American Baptist Publication Society, the American Baptist Home Mission Society, which has charge of the home missions, the Woman's American Baptist Foreign Mission Society and the American Baptist Education Society. The missions are carried on in nearly all the fields into which missionaries are sent. Under the auspices of the denomination are 98 colleges, 10 theological seminaries and 96 academies, seminaries, institutions and training schools.

The Northern Baptist convention and the Southern Baptist Convention are bodies which have general charge of the different activities of the denomination. The Northern Baptist convention met at Des Moines, May 22-29, 1912. The most important question under discussion at this meeting was that of education, especially collegiate education. As a result of the investigations made, the convention accepted definitely and vigorously the duty of furnishing to those for whom it is responsible an adequate and distinctly Christian education. A radical and far-reaching programme was proposed, beginning, under the direction of a permanent commission on religious and moral education, in the home and Sunday-school, and extending to every institution of learning which bears the denominational name. The Baptist Education Society was combined with the Education board of the convention. A forward movement calling for the raising of \$3,000,000 for the missionary interests of the denomination was instituted with great enthusiasm. A new plan of comity and coöperation between the Northern and Southern conventions was taken into consideration. See **BAPTISTS, FREE.**

BAPTISTS, FREE. The General Conference of Free Baptists is the national representative body of the Free Baptist denomination. It was incorporated in 1892, and receives as its members delegates from State organizations which in turn are made up of delegates from local associations; and these are composed of delegates from local churches. The General Conference since it incorporated has administered all the missionary and denominational activities of Free Baptists, home and foreign missions, education, and internal and interdenominational relations. Since 1904 negotiations have been conducted through joint committees

with the Baptist Societies, the American Baptist Foreign Mission Society, the American Baptist Home Mission Society, and the American Baptist Publication Society, with reference to uniting the missionary and denominational activities of the Free Baptists with those of the Baptists. These negotiations culminated in the adoption of an agreement, popularly called the "Basis of Union," the provisions of which went into effect October 1, 1911, by which the General Conference transferred the greater part of its invested funds and all of its missionary and publication interests to these societies, using them as their own missionary agencies. This union of funds and functions naturally leads to the consideration of union, and its actual accomplishment, between the constituent bodies and the local churches, so that during the year closing, both East and West, many other forms of union, affecting associations and churches, have taken place, or are in process.

The Free Baptists have been organized in about 1400 churches, with about 80,000 church members. Their numbers are largest in the New England States, particularly Maine and New Hampshire and a few Western States, such as Michigan and Wisconsin, although they have churches scattered through New York State, Ohio, Indiana, Illinois, Nebraska, Iowa, and Kansas.

The Morning Star, which was founded in 1826, as the organ of the Free Baptists, was consolidated with *The Watchman*, of Boston, October 1, 1911. The Sunday School lesson sheets and Star Quarterlies have been incorporated in the publications of the American Baptist Publication Society. The foreign mission field of the Free Baptists, opened in 1835, in Bengal, India, usually manned by about twenty resident missionaries, has become one of the missionary fields of the American Baptist Foreign Mission Society.

BAR ASSOCIATION, AMERICAN. The annual meeting of this association was held in Milwaukee, on August 19, 1912. From the standpoint of popular interest the most important incident of the meeting was the action of the association on the election of William H. Lewis, Butler R. Wilson, and William R. Morris, all negro lawyers, as members of the association. The executive committee voted to elect all three in 1911 and Mr. Lewis and Mr. Wilson were elected at the annual meeting in 1911. It was alleged that no member of the executive committee who voted upon the election of Mr. Wilson and Mr. Lewis had any knowledge of the race of the candidate when so voting. On January 4, 1912, the committee having learned the race of Mr. Lewis, a resolution was passed to the effect that as the committee acted in ignorance the Lewis election be reconsidered and rescinded and his name be restored to the list of nominees to be acted upon by the general council in 1912. It was well known that this action of the committee was the result of protests made by lawyers in the southern States against the election of colored members. Mr. Lewis was an assistant attorney-general of the United States and had been proposed for membership by Attorney-General Wickersham. Following the action of the executive committee as noted above, Mr. Wickersham vigorously protested and threatened to leave the association if it rescinded the election of Mr. Lewis. At a meeting on August 12, 1912, resolutions similar to those affecting Mr.

Lewis were passed in regard to Mr. Wilson and Mr. Morris. The committee, defending its action, declared that it had not rejected any of the three mentioned persons for membership in the association or assumed to determine the advisability of electing to such membership a colored man otherwise qualified, but inasmuch as the settled practice of the association has been to elect only white men as members, the committee felt itself constrained to reserve the important question of electing colored men for determination by the association itself, and to that end, the committee regarded it as its duty to rescind its earlier action. The association voted that Mr. Lewis, Mr. Wilson, and Mr. Morris might retain their membership in the association, but that hereafter no member should be elected until the fact that they were colored had been made known to all members. Shortly after the meeting, Mr. Lewis, Mr. Wilson, and Mr. Morris resigned as members.

The address of the president, S. S. Gregory, was devoted to a résumé of new laws relating to government, trust regulation, judicial procedure, and kindred subjects during the year. Among the other important addresses delivered were the following: "New Nationalism," Frank B. Kellogg, of Minnesota; "Procedure in our American Judicial System," Frederick M. Judson, of St. Louis; "Recent Movement Toward the Realization of High Ideals in the Legal Profession," Charles A. Boston, of New York; "Judges," by Henry D. Estabrook, of New York; "The Courts and the Constitution," by Senator George Sutherland, of Utah.

Reports of committees, including those of the special committee to suggest remedies and formulate proposed laws to prevent delay and unnecessary cost in litigation, the committee on uniform State laws, the committee on international law, and the committee on patent, trademark, and copyright law. In conjunction with the meeting of the Bar Association were held meetings of the Association of American Law Schools and the American Institute of Criminal Law and Criminology. The officers elected at the meeting were as follows: President, Frank B. Kellogg; secretary, George Whitelock; treasurer, Frank E. Wadhams. Each State and Territory is represented by one vice-president and one member of the general council. The membership of the association is about 6000. The next meeting will be held in August, 1913.

BARBADOS. The most easterly of the Caribbees; a British colony. Its area is 166 square miles, and its population (1911), 171,892. Many laborers have been drawn to the canal zone, which together with emigrants to Pará (Brazil) and the United States accounts for the decrease in population since 1891, when it was 182,306. Bridgetown is the capital. The area under sugar-cane, the island's most important product, is estimated at 64,000 acres. There were in operation 332 sugar-works in 1910, producing 39,899 hogsheads of sugar and 77,722 puncheons of molasses. The export of cotton to Great Britain in 1910 was 589,118 pounds, valued at £35,942.

* Commerce is for calendar years, finance for fiscal years. † Tonnage entered and cleared.

Customs revenue (1909-10), £127,313. Public debt (March 31, 1910), £422,900 (sinking fund, £85,740). Governor in 1912, Sir Leslie Probyn (since 1911).

BARBUDA. See ANTIGUA.

BARGE CANAL. See CANALS.

BARLEY. The year 1912 was not favorable to the production of good barley crops in most countries growing this cereal, although record yields which largely discounted shortages elsewhere were secured in Russia and the United States. In nearly all European countries the growth of the crop was retarded by a backward season and still more injury was done by continued heavy rains in August and September, which interfered with harvesting and threshing. While in many regions the yield was satisfactory in spite of these conditions, the quality of the grain suffered much, a large proportion of the crop being stained or discolored as a result of the wet weather. The quantity of barley suitable for brewing purposes was inadequate to meet the requirements of Europe, the shortage being greatest in Germany, Austria, and France. Russia produced in 1912 464,124,715 bushels, an excess of more than 50,000,000 over the yield of 1911. The Roumanian yield was about 21,160,000 bushels, or over 5,000,000 bushels less than the preceding crop. In Italy, where a severe drought during the growing season proved injurious, the yield amounted to about 8,403,000 bushels, or about 20 per cent. less than the yield of the year before. The production of Spain was estimated at approximately 59,000,000 bushels, or about two-thirds of the crop of 1911. Estimates placed the French yield at about 51,000,000 bushels, or about 780,000 bushels more than the year before. Canada produced about 44,000,000 bushels, or over 3,000,000 bushels more than in 1911, due to some extent to an increase in acreage.

In the United States a production for the year of 223,824,000 bushels exceeded the yield of 1911 by 63,584,000 bushels. This crop was the first to exceed 200,000,000 bushels. The season was so favorable that the average acre yield of 29.7 bushels also stood out clearly as a record. The area devoted to the crop in 1912 was 7,530,000 acres, as against 7,627,000 acres in 1911. The price paid farmers on December 1, 1912, was only 50.5 cents per bushel, as compared with 86.9 cents on December 1, 1911, and on this basis the total value of the crop was given by the Department of Agriculture at \$112,957,000, or 18.5 per cent. above the five-year average. The leading States in barley production and their yields were as follows: Minnesota, 42,018,000 bushels; California, 41,760,000 bushels; North Dakota, 35,162,000 bushels; Wisconsin, 24,843,000 bushels; South Dakota, 23,062,000 bushels, and Iowa, 11,570,000 bushels. All other States produced less than 10,000,000 bushels. The highest average yield per acre for any State was 45 bushels, which was produced in Utah.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BAROTSELAND. See RHODESIA.

BARR, ROBERT. An English novelist, died October 22, 1912. He was born in Glasgow, Scotland, in 1850, but removed to Canada early in his youth. He graduated from the Normal School at Toronto and for a time held the position of headmaster of the Windsor (Canada)

Public School. In 1876 he removed to Detroit, where he joined the editorial staff of the *Free Press*, for which he wrote under the name of "Luke Sharp." Five years later he went to England. In 1892 he organized with Jerome K. Jerome the *Idler* magazine and was its editor for twenty years. He wrote many novels and short stories and was widely known as a writer in England and America. Among his best-known publications are: *In a Steamer Chair* (1892); *The Face and the Mask, Revenge*, and *In the Midst of Alarms* (1894); *A Woman Intervenes* (1896); *The Mutable Many* (1897); *The Countess Tekla* (1899); *Stranleigh's Millions* (1908); *Cardillao* (1909); *The Sword Maker* (1910).

BARTON, CLARA. An American philanthropist, died April 12, 1912. She was born in North Oxford, Worcester county, Mass., in 1821, and received her early education in the public schools. At the age of sixteen she began to teach, and after a few years entered and was graduated from the Liberal Institute at Clinton, N. Y. She afterwards resumed teaching and continued this for about ten years. She organized a system of public schools in Bordentown, N. J. In connection with her efforts to bring about the release of her brother, who had been captured by Federal troops in the Civil War, she came in contact with the wounded soldiers. She at once conceived the plan of organizing relief for the wounded. She announced in the papers of Worcester, Mass., that she would receive contributions and see to it personally that they were distributed. The answers which came to her appeals were so liberal that it was necessary to secure a warehouse in Washington to hold the stores that were accumulated. There was much opposition to the idea of women going to the front at that time, but she managed to make her way through to the headquarters of General Butler in Virginia. She first accomplished the release of her brother, who was still a prisoner, and then began the active work of nursing the wounded. She continued it almost throughout the war, and in 1864 was appointed by General Butler head nurse in the hospitals of the Army of the James. During the last year of the war she was entrusted by President Lincoln with the task of looking after the correspondence of the relatives of prisoners who were missing after the exchanges had been made. In 1865 she supervised the laying out of the grounds of the national cemetery at Andersonville.

During travel abroad in 1869 she first became acquainted with the Red Cross movement. At Geneva she was shown the treaty which had been signed by most of the civilized nations except the United States. By the provisions of this treaty those who wore the badge of the Red Cross were allowed to go on battlefields to care for the wounded. Miss Barton became greatly interested in this treaty and began at once to advocate its adoption by the United States. At the time of the outbreak of the Franco-German War she was at Bern and was invited by the officials of the Red Cross to engage in the work of that organization during the war. She went at once to Strassburg and became active in nursing and helping wounded soldiers. During this work she learned the importance of having trained helpers and ready supplies. For her services she received the Iron Cross of Merit from the German em-

peror. She afterwards went to Paris and was in that city during the Commune and after. Through her methods in handling the half-starved mobs that thronged the streets she came to have great influence over them. For her work in Europe she received many honors. The Servian Red Cross Medal was presented to her by Queen Natalie of Servia. She was awarded the Geneva Medal of Honor from the Comité International.

When she returned to the United States and endeavored to have the government become a signatory to the Red Cross treaty she found it unwilling to do so, and for several years she pressed upon the government officials her convictions in the matter. In 1881 she went to Washington in the attempt to persuade President Garfield to advocate action by the government. After an interview with Mr. Blaine, at that time Secretary of State, a meeting was held on March 21, 1881, in Washington, which resulted in the formation of the American Red Cross Association to take the place of the informal committee which had existed since 1877. Miss Barton was chosen president of the association. The Red Cross, under her leadership, took an active part in furnishing assistance in practically all the great disasters which came to the United States and other countries in that period. During the first year of the organization came the Michigan forest fires, and in the following year floods along the Mississippi and destructive cyclones engaged the resources of the association. In 1883 aid was furnished during the war in the Balkans. In the next year relief went to the Ohio and Mississippi valleys on account of the floods there. In 1889 aid was given to the sufferers from the Johnstown flood and in the Russian famines in 1891-2. After the Armenian massacres in 1896 Miss Barton organized relief expeditions and went to Constantinople herself. She actively engaged in relief work in the Spanish-American War. The last work in which she took personal part was after the flood at Galveston and after exertions continuing for more than six weeks she suffered a nervous breakdown. At this time she lacked but one year of being 80 years of age. In the organization of the American Red Cross she insisted that the association should be independent of any State organizations or of sanitary or Christian commissions. This desire to keep the control of the Red Cross completely separate from other associations led to much criticism which began in 1903 and finally led to Miss Barton's retirement from its head. On May 4, 1904, she resigned the presidency. She was the author of *The History of the Red Cross* (1882; published by the Government); *American Relief Expedition to Asia Minor* (1896); *History of the Red Cross in Peace and War* (1898); *The Story of the Red Cross* (1904); and *Story of My Childhood* (1907).

BASEBALL. The highest honors in baseball in 1912 were won by the Boston team of the American League, familiarly known as the Boston Red Sox. This aggregation of players captured the American League pennant with the greatest ease, despite the fact that the Philadelphia Athletics had practically the same team as in 1911, when they won the world's championship for the second successive year.

The series between the Red Sox and the New York Giants, winners of the National League flag, to decide the 1912 world's championship,

was the most exciting ever played. Eight games were necessary, Boston winning four and New York three. One game resulted in a tie score. The total attendance at the championship series was 250,037, while the receipts aggregated \$490,833. These figures broke all previous records. A composite score of the games shows that the Red Sox players outfielded the Giants, but were weaker than the New Yorkers in batting. It was the errors made at critical times by the Giants that led to their defeat. The scores of the games follow: Boston, 4, New York, 3; Boston 6, New York, 6; Boston, 1, New York, 2; Boston, 3, New York, 1; Boston, 2, New York, 1; Boston, 2, New York, 5; Boston, 4, New York, 11; Boston, 3, New York, 2.

A noteworthy feature of the American League pennant race was the excellent showing made by the Washington team, which nosed out the Philadelphia Athletics for second place. At the beginning of the season, the Washingtons were regarded by the majority of experts as doomed to finish in the second division, but the pitching of Johnson and the all-round work of Gandil, Foster, and Milan kept the team hovering between second and third places during the last half of the season. The final standing of the American League teams was: Boston won 105, lost 47; Washington won 91, lost 61; Philadelphia won 90, lost 62; Chicago won 78, lost 76; Cleveland won 75, lost 78; Detroit won 69, lost 84; St. Louis won 63, lost 101; New York won 50, lost 102. The leading pitcher of the American League was Joseph Wood, of Boston, and the leading batter was again Tyrus Cobb, of Detroit, whose average was .410.

In the National League the New York Giants began the season in much better physical condition than their rivals, with the result that they rolled up a commanding lead in the first weeks of the campaign. During this early season spurt, "Rube" Marquard, the Giant pitcher, won 19 straight games, a new record for modern baseball. A bad slump struck the team later on, however, and for a time it seemed as though Chicago and Pittsburgh might drag the Giants out of first place. The New Yorkers rallied in season, nevertheless, and finished the campaign with 103 victories as against 48 defeats. The standing of the other clubs follows: Pittsburgh won 93, lost 59; Chicago won 92, lost 59; Cincinnati won 75, lost 78; Philadelphia won 73, lost 79; St. Louis won 63, lost 90; Brooklyn won 58, lost 95; Boston won 52, lost 101. Hendrix of the Pittsburgh team was the leading pitcher in point of number of games won, and Zimmerman of Chicago was the leading batter. According to the ranking of the secretary of the league, based on the number of runs for which each pitcher was responsible, or, in other words, runs earned off the pitching solely, the leading pitcher of the league was Tesreau of the New York Giants. The average number of runs in 9-inning games chargeable to him was 1.96. Mathewson, also of the Giants, ranked second with 2.12, and Rucker of Brooklyn, third, with 2.20.

The pennant winners in the more important minor leagues in 1912 were: International, Toronto; American Association, Minneapolis; Southern, Birmingham; Tri-State, Harrisburg; Pacific Coast, Oakland; Connecticut, New Haven; New York State, Utica; New England, Lawrence.

Williams made the best showing among the colleges, winning 11 games and losing 3. Princeton ranked second with 18 victories and 6 defeats. The scores in Williams's principal games were: Williams 2, Princeton 0; Williams 6, Yale 1; Williams 4, Dartmouth 1, and Williams 2, Dartmouth 0; Williams 6, Holy Cross 1; Williams 8, Cornell 5; Williams 6, Wesleyan 1, and Williams 3, Wesleyan 2; Williams 8, Amherst 2, and Williams 0, Amherst 2; Williams 6, Harvard 7.

Princeton defeated Georgetown 3-1 and 5-4; Brown 2-1; Cornell 2-0; Pennsylvania 8-0 and 3-2; Michigan 6-3; Harvard 5-1; Lafayette 3-2; Amherst 11-1; Yale 4-2, and 19-6. Princeton was defeated by Penn State 1-4; Holy Cross 4-6; Cornell 2-3; Williams 0-2; Yale 1-6.

Yale defeated Cornell 4-1 and 2-1; Columbia 4-0; Holy Cross 8-2; Georgetown 6-3 and 17-0; Amherst 12-3; Princeton 6-1; Dartmouth 6-5; Harvard 9-6 and 5-2. Yale was defeated by Georgetown 2-3; Holy Cross 4-9; Brown 1-3 and 2-8; Princeton 2-4 and 6-19; Cornell 0-3.

Harvard defeated Columbia 8-5; Amherst 3-2; Lafayette 6-1; Pennsylvania 2-1; Williams 8-6; Holy Cross 7-3. Harvard was defeated by Georgetown 1-5; Bates 2-3; Holy Cross 5-7; Dartmouth 5-9; Brown 4-5 and 1-2; Princeton 1-5; Yale 6-9 and 2-5.

BASKETBALL. Columbia for the second successive year won the intercollegiate championship with 8 victories and 2 defeats. Dartmouth finished second, winning 7 games and losing 3. The standing of the other teams was: Pennsylvania won 6, lost 4; Cornell won 5, lost 5; Princeton won 3, lost 7; Yale won 1, lost 9. Columbia defeated Princeton 29-16, and 23-16; Yale 22-20, 20-8 and 18-14; Dartmouth 18-17; Pennsylvania 15-10 and 22-20. Columbia was defeated by Dartmouth 18-30 and by Cornell 7-19. Dartmouth defeated Yale 37-16 and 14-12; Cornell 19-16 and 18-10; Pennsylvania 19-18; Princeton 42-12; Columbia 30-18. Dartmouth was defeated by Columbia 17-18, by Pennsylvania 18-21; and by Princeton 38-43. Pennsylvania won victories over Yale 21-13 and 27-11; Cornell 23-21 and 23-18; Dartmouth 21-18; Princeton 34-21. Pennsylvania lost to Dartmouth 18-19; Columbia 10-15 and 20-22; Princeton 29-30. Cornell defeated Princeton 37-26 and 32-18; Columbia 19-7; Yale 33-17 and 27-13. Cornell lost to Dartmouth 16-19 and 10-18; Pennsylvania 21-23 and 18-23. Yale's only victory was over Princeton, 19-18. The total number of points made by each team follows: Dartmouth 252; Cornell 233; Pennsylvania 226; Princeton 224; Columbia 192; Yale 145. The total number of points scored against these teams was: Columbia 170; Dartmouth 184; Cornell 186; Pennsylvania 194; Princeton 299; Yale 239.

BASUTOLAND. A British dependency in southern Africa, northeast of the Cape of Good Hope Province. Its area is 11,716 square miles, and its population (1911 preliminary) 405,832 (1411 whites). Maseru, the capital, had 861 natives and 500 whites. The soil is excellent for grain cultivation, the abundant native pastures furnish food for enormous herds, and the climate is well suited to Europeans. The chief products are wool, wheat, mealies, and kaffir corn. The South African Railway operates a branch line from Marseilles to a point near Maseru within the Basutoland border.

* Commerce is for calendar, finance for fiscal years.

The paramount chief is Letsie. The governor-general for the Union of South Africa administers the territory (which is not, however, a part of the Union), through a resident-commissioner (Sir Herbert Cecil Sloley in 1912).

BATHUB TRUST. See TRUSTS.

BATTLESHIPS. GREAT BRITAIN. The four ships of the *Orion* class (*Orion*, *Monarch*, *Thunderer*, *Conqueror*) are now in commission. The *Orion*, the first completed, rolled so deeply in a heavy sea that her bilge keels had to be enlarged. She developed a much more serious defect, in common with the *Dreadnought* and all the single-masted ships, the *Neptune*, *Hercules*, *Colossus*, *Lion*, *Monarch*, *Thunderer*, and *Princess Royal*, viz., the heat from the funnels made the fire-control station and the navigation-bridge untenable. The necessary extensive (and expensive) alterations have already been made on some of these ships.

Of the four ships of the *King George V.* class (*King George V.*, *Centurion*, *Ajax*, and *Audacious*), the first two having been completed, the *Ajax* and *Audacious* are due for completion in 1913. The ships are fitted with anti-rolling tanks. The *King George V.* carries a single pole-mast and a signal mast.

Four ships of the *Iron Duke* class (26,400 tons; *Iron Duke*, *Marlborough*, *Delhi*, *Benbow*) have been laid down this year. They will be improved *George V.*'s, and the first British dreadnought battleships to have a torpedo-defense battery of 6-inch guns. The 6-inch guns are, for the most part, placed behind armor. The class will be further strengthened by internal subdivision against torpedo attack; and by internal armor over the vital parts. Oil fuel, as well as coal, is to be carried.

Of the four battleships of the 1912 programme, the *Queen Elizabeth* and the *Warspite* have been laid down, and the *Valiant* and the *Barham* ordered. Each of these ships will carry eight 15-inch guns in four turrets on the centre-line, and sixteen 6-inch guns in a central casemate. Displacement, 27,000 tons; speed, 25 knots; turbine engines to develop between 50,000 and 60,000 horsepower. They will be provided with funnel and deck protection against aerial craft, and will be the most costly battleships yet designed.

GERMANY. There are five ships of the turbine-driven *Kaiser* class: *Kaiser*, *Friedrich der Grosse*, *Kaiserin*, *König Albert*, *Prinz Regent Luitpold*. The *Kaiser* and the *Friedrich der Grosse* are in commission; the other three will be completed in 1913. The forward turret and the two after-turrets are on the centre line, No. 4 turret being superposed so as to fire over No. 5. Turrets Nos. 3 and 4 are in broadside, but *en échelon*. It is understood this is now the standard disposition.

UNITED STATES. The *Wyoming* and *Arkansas* are now in commission; the *New York*, *Texas*, *Nevada*, and *Oklahoma* are under construction. Bids for the *Pennsylvania* will be opened on February 18, 1913. Exclusive of

armor and armament, the limit of cost set by Congress in the naval appropriation bill of August 22, 1912, is \$7,425,000. Present plans contemplate: Length on designer's waterline, 600 feet; length over all, 608 feet; breadth, 97½ feet; draft, 28 feet, 10 inches; displacement, 31,400 tons; speed on four-hour trial, 21 knots; armament, twelve 14-inch guns, twenty-two 5-inch guns, four submerged torpedo tubes; heavy armor; motive power, reciprocating engines or turbine, to be decided when bids are opened; to burn oil exclusively.

FRANCE. The three ships of the *Bretagne* class (*Bretagne*, *Provence*, and *Lorraine*) were laid down this year. Characteristics: Displacement, 23,500 tons; speed, 20 knots; Parsons turbines in four groups, one group to a shaft; four torpedo tubes, 18-inch; Bullivant torpedo nets; armament, ten 14.5-inch guns in five centre-line turrets, twenty-two 5.5-inch guns, four turret guns fire ahead and four astern, and all ten fire abeam, with a very wide arc of train. Two ships are to be laid down in May, 1913. The displacement now contemplated is 25,700, though it may ultimately be increased to 27,000 tons, to afford better protection than that of the *Barts* and *Bretagnes*. It is now thought that these ships will be armed with twelve 14.5-inch guns in three centre-line turrets. The nominal speed will be 20 knots under easy conditions, and 21 knots are to be exceeded on trial.

JAPAN. The battleship *Fuso*, building at

Kure, launched March 11, 1912, will displace about 30,000 tons; her main armament is not known. It is given as ten 13.5-inch guns, and also as ten 15-inch guns, with a secondary battery of sixteen 6-inch guns. Speed, 22½ knots, with 45,000 horsepower turbines.

ITALY. The *Dante Alighieri* is now in commission. At full power her engines worked up to 35,000 horsepower and her speed on a series of runs over the measured mile gave a mean of 24.5 knots. At four-fifths horsepower a shaft power of 21,000 was developed, giving 21 knots speed. For political reasons it was decided to make the *Duilio* and *Doria* (laid down in 1912) sister ships to the *Cavour*. It is said that the *Morosini* and *Dandolo*, projected, will be of 29,000 tons, 48,000 indicated horsepower, 25 knots speed, and will each carry ten 14-inch or 15-inch guns and twenty-two 6-inch guns.

AUSTRIA. The *Viribus Unitis* is the first of the four ships of her class to be completed. Of the others, the *Tegetthoff* was launched on March 21, 1912, and the *Prinz Eugen* on November 30, 1912; the fourth, not yet named, was laid down in July, 1911.

RUSSIA. The *Sevastopol*, *Petropavlovsk*, *Poltava*, and *Gangut*, all launched in 1911, are still under construction in St. Petersburg under the supervision of Messrs. John Brown and Company, Clydebank. The *Emperor Alexander III.*, *Empress Marie*, and *Catherine II.*, building at Nicolaieff on the Black Sea, were

614	566	372	463	442

laid down on October 30, 1911. Supposed characteristics: Displacement, 22,500 tons; designed indicated horsepower, 25,000; speed, 21 knots; armament, twelve 12-inch guns and twelve 6-inch guns. They are due for launching in 1913.

BRAZIL. The original main armament of the *Rio de Janeiro* was to have been twelve 14-inch guns, all on the centre line. It has been officially announced that this plan has been changed, and that she will have fourteen 12-inch guns in seven centre-line turrets.

ARGENTINA. The *Moreno* and *Rivadavia*, due for completion in 1912, are still under construction.

BRITISH BATTLE CRUISERS. The position of the battle cruiser with reference to the battleship is best shown in England. Until 1911 no British battleship of the *Dreadnought* type was given a designed speed of more than 21 knots. The *Iron Duke* class, laid down in 1912, will make 22.0 knots. The designed speed of the battle cruiser has risen from 25 knots in the *Indomitable* class (eight 12-inch guns, sixteen 4-inch guns) to 28 knots in the *Princess Royal* class (eight 13.5-inch, sixteen 4-inch guns). England will therefore soon be in the position of six years ago, when the newest battleship, the *Dreadnought*, was as fast as the armored cruisers, the *Cressy* class, completed some four or five years before her. As the battleships of the 1912-13 programme are to make 25 knots, how can the name "battle cruiser,"

which is understood to connote abnormal speed, be rightly given to the 25-knot *Indomitables*? The British battle cruiser *Tiger*, laid down on June 20, 1912, and due for completion March 31, 1914, will displace 30,000 tons (estimated), develop 110,000 indicated horsepower (estimated), have a designed speed of 31 knots, and be armed with eight big guns and sixteen 6-inch guns.

BAVARIA. See LUITFOLD, KARL JOSEPH WILHELM.

BAVARIAN ELECTIONS. See GERMANY.
BECHUANALAND PROTECTORATE. A British dependency in the south of Africa, considered administratively as a part of the crown colony of British Bechuanaland until the annexation of that colony (November 15, 1895) to the (then) Cape Colony. Thereafter the protectorate was administered as a separate territory by a resident-commissioner (1912, Lieut.-Col. F. W. Panzera), under the direction of the high commissioner for South Africa, from the headquarters at Mafeking (Cape of Good Hope province). The area is estimated at 275,000 square miles; population (census 1911), 125,350 (1692 whites). The chief of the Bamangwato is Khama, and his chief town is Serowe; of the Bakwena, Sechele, residing at Molepolole; of the Bangwaketse, Gaseitsiwe, at Kanye; of the Bakhatla, Linchwe, at Mochudi; of the Batawana, Mathibe, at Lake N'gami; of the Bamalete, Baitlothe, at Ramoutsa. The railway from Capetown to Rho-

desia (with an extension beyond the Victoria Falls) traverses the protectorate. Estimated revenue (1911-12), £46,600; estimated expenditure, £68,551. The annual deficit is made up by the imperial government.

BEECHER, WILLIS JUDSON. An American theologian and educator, died May 8, 1912. He was born in Hampden, Ohio, in 1838 and graduated from Hamilton College in 1858. He studied theology at the Auburn Theological Seminary, graduating in 1854. In the same year he was ordained to the Presbyterian ministry. He was pastor at Ovid, N. Y., in 1864-65. In the latter year he was appointed professor of moral science and belles lettres at Knox College, which chair he held until 1869 when he resigned to become pastor of the First Church of Christ at Galesburg, Illinois, and remained here until 1871. In that year he was appointed professor of Hebrew language and literature at the Auburn Theological Seminary. He continued in this position until 1908. In 1902 he was Stone lecturer at the Charleston Theological Seminary. He was president of the Society of Biblical Literature and Exegesis in 1904. He wrote several works on theological subjects, among them *Prophets and the Promise* (1905); *The Teaching of Jesus Concerning the Future Life* (1908); *The Dated Events of the Old Testament* (1907). He also contributed many articles to newspapers, magazines, and reviews.

BEER. See LIQUORS.

BEERNAERT, AUGUSTE MARIE FRANÇOIS. A Belgian public official and philanthropist, died October 6, 1912. He was born at Ostend in 1829. He studied law and in 1853 began its practice in Brussels. He soon attracted attention by his gifts as a speaker. He took an active part in politics and in 1873 was appointed Minister of Public Works in the cabinet of Malou. In 1884 when the latter again took office Beernaert became minister of agriculture, commerce, and art, and on the resignation of Malou a few months later succeeded him as premier. He was one of the earliest and foremost advocates of international arbitration and was probably a member of more arbitral tribunals than any other man of his time. The reforms in the Belgian Congo were largely due to his efforts. He was for more than forty years the head of the powerful Catholic party in the Belgian Parliament. In 1909 he was, with M. d'Estournelles de Constant, awarded the Nobel prize for peace. Shortly before his death he presided over the Interparliamentary Congress at Geneva.

BEET SUGAR. See SUGAR.

BEHRENS, SIEGFRIED. An American musician, died November 5, 1912. He was born in Hamburg, Germany, in 1839. He took up the study of the piano at ten years of age. In 1856 he came to the United States with a reputation as a performer of wonderful promise. His first position was that of instructor in music at a school near West Point. In 1867 he was appointed operatic conductor with the Strakosch-Gottschalk-Patti Opera Company. When still but 24 years of age he was selected as a conductor of the Caroline Richings English Opera Company and continued with it until that organization consolidated with the Parepa Rosa Company. When the Metropolitan Opera

Company at New York decided to begin the production of grand opera in Philadelphia at the Old Academy of Music, Behrens was selected as manager of the company and conductor. He had a profound knowledge of musical subjects and a remarkable memory for technical and personal matters relating to musicians.

BELGIAN HARBOR IMPROVEMENT. See DOCKS AND HARBORS.

BELGIUM. A constitutional monarchy of western Europe, lying between France and the Netherlands and bordering on the North Sea. The capital is Brussels.

AREA AND POPULATION. The area and population by provinces, according to the census taken December 31, 1910, and compared with the figures for 1831, with the number of inhabitants per square kilometer in 1910, are as follows:

	Sq. kms.	1831	1910	Per km.
Antwerp	2,832	349,942	968,677	342
Brabant	3,283	561,828	1,469,677	448
West Flanders....	3,234	608,226	874,135	270
East Flanders....	3,000	742,973	1,120,335	373
Hainaut	3,722	613,179	1,232,867	331
Liège	2,895	375,030	888,341	307
Limbourg	2,408	160,090	275,691	114
Luxembourg	4,418	160,762	231,215	52
Namur	3,660	213,784	362,846	99
Total Belgium..	29,451*	3,785,814	7,423,784	252

* 11,371 square miles.

Of the total population in 1910, 3,680,790 were males and 3,742,994 were females. The census of 1900 returned 6,093,548 (3,324,834 males and 3,368,714 females); 1880, 5,520,009; 1850, 4,426,205. Since 1856 the population shows an augmentation of 63.90 per cent., a development by no means equal throughout the provinces, as shown by the following details: Antwerp, 122.95 per cent.; Brabant, 96.26; West Flanders, 39.88; East Flanders, 44.19; Hainaut, 60.31; Liège, 76.38; Limburg, 43.81; Luxembourg, 19.33; Namur, 26.79. In the table below will be seen the population in 1900, the population in 1910, the augmentation during the decade due to excess of births over deaths, and that due to excess of immigration over emigration for the kingdom, by provinces (+ = excess of immigration, — = excess of emigration):

	1910	1900	Ex. Births	Emigration
Antwerp	819,159	968,677	137,121	+12,397
Brabant	1,263,535	1,469,677	122,357	+83,785
West Flanders....	805,236	874,135	105,206	+36,307
East Flanders....	1,029,971	1,120,335	130,091	+39,727
Hainaut	1,142,954	1,232,867	78,161	+11,752
Liège	826,175	888,341	60,537	+1,629
Limburg	240,796	275,691	43,027	+8,132
Luxembourg	219,210	231,215	19,596	+7,591
Namur	346,512	362,846	21,467	+5,133
Tot. Belgium..	6,693,548	7,423,784	717,563	+12,673

Population (census of 1910) of Antwerp, 301,766 (with suburbs, 398,255); of Brussels, 177,078 (720,347); Ghent, 166,445 (210,428); Liège, 167,521 (242,357). These four cities, with their environs, contain 21.16 per cent. of the population of the kingdom: but the appearance of "urbanization" induced by these fig-

ures is offset by the fact that the dependent communes cover areas with boundaries widely separated from the urban centres. Within these confines are areas devoted to agriculture. Some of the more important urban communes, with their population (census 1910), are: Mechlin, 59,142; Bruges, 53,285; Borgerhout, 49,333; Verviers, 46,948; Seraing, 41,015; Ostend, 42,207; Louvain, 42,123; Tournai, 36,982; Courtrai, 35,689; Alost, 35,125; Saint-Nicolas, 34,774; Namur, 32,362; Berchem, 30,274; Charleroi, 28,177; Mons, 27,828; Jumet, 27,956; Roulers, 25,026.

Movement of the population 1910: 176,413 living births, 165,576 legitimate and 10,837 illegitimate; 8008 still-births, 709 illegitimate; 58,776 marriages; 1089 divorces; 112,826 deaths, 58,605 males and 54,221 females. Of the deaths, 9141 were due to tuberculous affections (7217 pulmonary); 10,592 to organic diseases of the heart, 10,265 to senile debility; there were 3525 violent deaths (1051 suicides—822 men, 229 women).

EDUCATION. In 1910 there were 7525 primary schools (21,313 teachers and 929,347 pupils), 54 primary normal schools (4725 students), 4722 schools for adults (240,019 scholars), 3112 infant schools (271,237 children). University population: Ghent, 1172; Liège, 2790; Brussels, 1318; Louvain, 2600—total, 7880.

AGRICULTURE. Under cultivation in the kingdom (a previous census, 1910 statistics not yet being available), 2,607,514 hectares (including 721,938 fallow, under brush, and otherwise irregularly productive), of which 1,818,156 under sown crops and grasses, and 67,419 under orchards, gardens, vineyards, etc. The following table gives areas planted to main crops in 1911 and 1912, in hectares; the production, in quintals; and the average yield per hectare in 1911:

	Hectares		Quintals		Qs. per ha.
	1911	1912	1911	1912	
Wheat	152,000	166,600	3,978,000	4,158,600	26.0
Rye	255,000	260,000	5,365,000	5,720,000	23.0
Barley	34,500	34,000	1,000,500	918,000	29.0
Oats	245,030	255,500	6,002,500	5,110,000	24.5
Flax	19,000	21,000	126,600†	...
Beets *	60,800	66,000	14,760,000	19,000,000	242.8
Tobacco	4,000	3,900	100,000	100,000	25.0
* Sugar beets. † Seed; fibre, 168,800 quintals.					

The incessant August and September rains in 1912 affected both the tobacco and the sugar-beet crops; so that, while the yield in weight will not be materially affected, the quality has suffered. The autumn sowings were benefited by a warm, sunny October.

Estimated number of cattle December 31, 1909, 1,856,833; horses, 255,229; swine, 1,116,500.

MINING AND METALS, ETC. Number of quarries in operation in 1910, 1522, with 35,711 employees; value of products, 66,418,720 francs. Coal mines, 133 (143,701 employees); 23,916,560 metric tons, valued at 348,877,000 francs (14.59 francs per ton). Value of iron ore (1910), 566,950 fr.; blende, 139,600 fr.; galena, 26,450 fr. Furnace products, 1,852,090 metric tons, valued at 120,161,000 fr.; manufactured iron, 299,500 tons, 39,494,000 fr.; cast steel ingots, 1,892,160 tons, 161,606,000 fr.; worked steel ingots, blooms and billets, 1,074,210 tons, 98,634,000 fr.; finished steel, 1,534,550 tons, 192,220,000 fr.; zinc ingots, 181,745 tons, 103,541,000 fr.; pig-lead, 40,715 tons, 13,464,000

fr.; silver from lead 264,655 kilos, 27,754,000 fr.

Sugar mills numbered (1900), 92; production, 271,282 tons. Sugar refineries, 22; production, 114,538 tons. Manufactured tobacco, 10,761 tons. Breweries, 3349; production, 1,601,858 kiloliters. Distilleries, 125; 71,087 (50° G. L.).

COMMERCE. The table below gives a résumé (in millions of francs) of the trade during the last years of four decades:

	1880	1890	1900	1910
Imports (general)	2,710.4	3,189.2	3,594.4	6,551.7
(special)	1,680.9	1,672.1	2,215.8	4,265.0
Exports (general)	2,225.2	2,948.1	3,297.5	5,694.6
(special)	1,216.7	1,437.0	1,922.9	3,407.4

A few of the important imports, with values in thousands of francs in 1910, follow—cereals, etc. (582,666), wool and woolsens (442,139), minerals (197,462), seeds (171,178), timber (150,494), cotton, etc. (148,489), flax, etc. (143,034), raw hides (139,296), coal (107,478), rough diamonds (98,447), resins, etc. (96,301), iron ore, etc. (92,520), machinery (80,458), dyes, etc. (68,213), coffee (63,699), live animals (53,334). Exports—wool, yarn and mfrs. (436,450), iron and steel (224,287), machinery, etc. (180,762), cereals (163,170), raw flax (121,136), vegetable fibre, yarn and mfrs. (113,439), seeds (111,509), cut diamonds (99,057), zinc (91,960), raw hides (91,441), coal (88,636), paints, etc. (85,087), glass and glassware (84,496), cotton mfrs. (78,478), resins, etc. (53,010), manures (50,277), sugar (45,151), live animals (42,647).

France furnished imports to the value (1910) of 747.2 millions of francs and received exports valued at 669.1 millions; Germany, 576.1 and 881.4; Great Britain, 516.8 and 457.6; Russia, 364.1 and 67.0; Netherlands, 293.1 and 327.9; Argentina, 278.1 and 128.6; United States, 231.2 and 117.1. During the year 10,943 vessels, of 15,101,171 tons entered, and 10,929 of 15,074,061 tons, cleared. Merchant marine, 97 steamers (184,261 tons) and 4 sailing vessels (3183 tons).

COMMUNICATIONS. Railways in operation, December 31, 1910, by the state, 4330 kilometers (of which 4072 are state-owned); by companies, 349—a total length of 4679 kilometers throughout the kingdom. In view of the present agitation over the numbers of annual victims of railway accidents in the United States, it is of interest to note that out of 193,069,662 passengers carried over the Belgian lines during 1910, the total number of persons killed and injured was 1147, of whom 165 were suicides, persons walking illegally upon the tracks, etc. The total number of victims from 1835 to the end of 1910, out of 3,999,925,826 persons carried, was 42,989, of whom 6037 were suicides, etc.—an average of 10.75 accidents to one million passengers. Of the persons killed in 1910, 11 were passengers and 77 employees of the railways (443 and 3238 from 1835-1910); of those injured, 359 were passengers and 535 employees (7616 and 25,655). The light railways in Belgium amounted to 2450 miles, with 444 miles under construction. Electrification had progressed actively and 360 miles of existing line were so worked, while 100 miles of that under construction was destined for electric operation. The Neckerpoel Station at Malines was being reconstructed

during the year. Telegraph lines (end of 1910), 7582 kilometers; wires, 39,884 (not including semi-private lines along waterways, etc.). There are 11 wireless stations.

FINANCE. The franc (worth 19.3 cents), is the unit of value. The table of revenue and expenditure below is in thousands of francs (1912 budget):

	1835	1900	1909	1912
Rev. ordinary.....	89,171	494,106	645,107	703,883*
" extraordinary 1,904		48,672	150,109
Total	91,075	542,778	795,216
Exp. ordinary.....	85,614	479,056	634,450	708,081†
extraordinary 1,490		95,102	151,747
Total	87,104	574,158	786,197

* Direct taxes, 73,166,000 francs; customs, 57,803,650; excise, 81,138,300; registration, 77,253,000; revenue-earning administrations, 371,925,730; domains, dividends, interest, etc., 31,635,090; repayments, etc., 8,458,324.

† Service of the debt, 198,711,930; civil list, 5,479,090; Justice, 30,636,400; foreign affairs, 4,990,846; interior, 7,792,915; sciences and arts, 40,679,402; colonies, 1,262,700; industry and labor, 26,764,217; railways, posts, telegraphs, 255,728,463; war, 67,976,440; gendarmerie, 10,379,460; finance, 24,385,900; agriculture and public works, 30,446,746; repayments, etc., 2,826,000.

The total consolidated debt in 1835 was 96,841,080 francs; in 1870, 682,880,914; in 1900, 2,650,898,151; in 1910, 3,703,403,693; on January 1, 1912, the total consolidated debt was 3,734,354,038.

GOVERNMENT. The king is the executive, assisted by a ministry of eight members, responsible to a chamber of representatives and appointed by the king. The legislative power is exercised conjointly by the king and a parliament made up of two houses—a senate and an elective chamber of representatives. The reigning sovereign in 1912 was Albert, son of the late Prince Philippe of Saxe-Coburg and Gotha, born 1875. Prince Leopold (born 1901), is heir-apparent. The ministry, as constituted November 12, 1912, was as follows: Premier and minister of war, Baron de Broqueville; Justice, H. Carton de Wiart; Foreign Affairs, J. Davignon; Interior, Paul Berryer; Science and Arts, P. Poulet; Finance, M. Levie; Agriculture and Public Works, G. Helleputte; Industry and Labor, Armand Hubert; Railways, A. van de Vyvere; Marine, Posts, and Telegraphs, M. Seghers; Colonies, J. Renkin.

ARMY. During 1912 further progress was made in the reorganization of the army on a basis of personal service as provided by the law of December 14, 1909, which provided for a strength of 42,800 men on a peace basis and 180,000 on a war footing, the annual quota being obtained by the enlistment of one son in each family. In 1912 there were with the colors 3540 officers and 41,120 men exclusive of officials and gendarmes. Progress was being made with the plans for the fortification of Antwerp, for other works, and for an aviation school. The organization of the forces was as follows: Cavalry—2 regiments of chasseurs, 2 of guides, and 4 of lancers, each composed of 4 active squadrons and 1 in reserve, and also the mounted troops of the gendarmerie, numbering about 1700 men. Artillery—4 brigades each of 2 regiments of field batteries with 12 reserve field batteries and ammunition columns and 4 horse batteries.

Engineers—1 regiment of 3 battalions, a reserve battalion and 5 companies of technical troops. The infantry included 14 regiments of the line and 1 regiment of genadiers, organized into 4 battalions of 4 companies each, 3 battalions for active service and 1 a reserve battalion. There were further a regiment of carabineers of 6 battalions, 4 active and 2 reserve, and 3 regiments of chasseurs-à-pied. It was believed that within a few months Belgium would be able to place in the field a field army of about 300,000 men without counting the territorial army.

HISTORY

NATIONAL DEFENSE. Sharp criticism was directed against the government during the closing months of 1911 for its neglect of Belgian defenses. The subject was much discussed after the threatened crisis in the Franco-German negotiations over the Moroccan affair in September. It was pointed out that the country was utterly unprepared to resist an invasion at that time. And if Germany, as might have happened, had thrown her forces into Belgium in order to turn the flanks of her enemy, there would have been no means of preventing it and Belgium would have failed completely to do her share in maintaining her own integrity. Belgian neutrality is guaranteed by the other powers, but that guarantee is based on the assumption that she will put forth some efforts on her own behalf. The discussion continued into 1912, and drew out many vigorous protests from leading politicians of all groups and from military authorities against this neglect of the Belgian frontiers. In the course of a debate in the Chamber, members of the opposition taxed the government with its unpreparedness. The matters brought out in the debate confirmed the critics in their opinion that Belgium would have been in no position to do her part had matters taken a different turn in 1911. The government was believed by many to lean towards Germany. It was accused of a lack of patriotism and the French-speaking element was further incensed by its attempt to make the Flemish language paramount to French. If Belgium is to preserve her independence, she must, it was argued, organize her defenses. "Neither the improvident nor the pusillanimous will be defended by any one," said a prominent speaker, "they will simply be placed under somebody else's tutelage. We have known in our history what it was to be under the tutelage of foreigners, and the painful recollection survives. That remembrance explains the profound grief and resentment with which the nation realizes that the country was not prepared to defend its integrity during the critical months of July, August, and September last year." M. Vandervelde, the Socialist leader, figured prominently in the discussion and took the same general position as to the national duty of a Socialist that was taken by Herr Bebel in Germany the year before. The latter had declared that if war were forced on Germany the German Socialists would fight for their country like other Germans. M. Vandervelde said that if Belgium were attacked the Belgian Socialists would fight in her defense. He declared if his party came into power it would address itself to this problem and place the defenses of Belgium on a firm basis.

ELECTIONS. The Clerical party which has

been in power for twenty-eight years had seen its majority cut down from 72 in 1900 to six in the last Parliament. The opposition appeared to be steadily gaining ground, and as the elections approached was hopeful of completely overthrowing the weakened government. To accomplish this it was necessary for Socialists and Liberals to join hands. A Socialist-Liberal alliance was formed in 1911 looking to the reversal of the government's policy on the school question and to the reform of the suffrage. The school question was the chief issue in the elections, which were held on June 2, 1912. The Socialists and Liberals were strongly opposed to the government's proposal that the church schools should have the same subsidies as the others. The Clericals, on the other hand, argued for the public support of a religious education, pointing to the labor troubles in Great Britain and the outbreak of crime in France as the fruits of the opposite system. The result of the elections was an unexpected and decisive victory for the government, giving the Clericals a new lease of power with an increased majority. The Catholic majority in the Chamber was increased from six to eighteen. Partial elections to the Senate on June 4 indicated also a Catholic majority. The constitution of parties in the new Chamber in which the number of seats had recently been increased from 106 to 186, was as follows: Clerical, 101; Liberals, 45; Socialists, 38; Christian Democrats, 2. Various reasons were assigned for this outcome. It was explained in part by the fear of the Liberals that their new allies, the Socialists, would carry them too far. They were with them in their attacks on the Church, but they were not with them in their attacks on property. The moderate Liberals were naturally loath to arm with power a party that sought ultimately the nationalization of the means of production. They agreed with the Socialists in wishing to abolish the system of plural voting. In Belgium there is universal suffrage for citizens over twenty-five, but special qualifications entitle certain classes to additional votes. Certain property qualifications give the citizen one additional vote, and certain educational qualifications give him two additional votes. It was chiefly owing to these conditions that the Clericals had remained so long in power, and it was not likely that they would bring in a measure of electoral reform to their own undoing. It was therefore only by a Socialist-Liberal alliance that such a measure could be carried. But many of the Liberals enjoyed the advantage of the plural vote, and the more moderate among them, though theoretically opposed to the system, hesitated to relinquish this advantage which might be very useful against the Socialists if the present alliance did not last. Another reason assigned for the defeat of the allied parties was their anti-clerical teachings. See also **SOCIALISM**.

PLANS OF THE OPPOSITION. The opposition groups, who had gained steadily on their rivals for the last ten years and who had counted on an easy victory, were much discouraged by the results. Not only were the Clericals entrenched in power for six years, but, since the Liberals could not hope to secure a majority by themselves, and since an alliance with the Socialists redounded to the advantage of their adversaries, there seemed little hope of breaking the power of the Clericals so long as the present electoral system continued. The opposition

therefore set out to secure a constitutional amendment abolishing plural voting. Some of the Clericals favored this, being enthusiasts for universal suffrage including votes for women, but party discipline seemed likely to prevent their breaking the ranks. As to woman suffrage, the Liberals were strongly opposed to it and the Socialists, though in favor of it, decided in their party congress to defer the question for the present. The principle, "one man, one vote," found its strong support among the Socialists, the Liberals, and the Labor party. The last-named decided upon the extreme measure of a general strike to force the government to grant constitutional revision, if it did not of itself take that action after the opening of Parliament. The trades unions began to gather funds for the purpose. Many of the Liberals declared that they would support such a strike if it occurred, and the movement found adherents even among the *bourgeoisie*. Parliament opened on November 12, and M. Schollaert was elected president of the Chamber. The programme of the ministry comprised elaborate plans of social legislation and national defense, including old age pensions, compulsory school attendance, improvement in technical training, and an extension of the compulsory military system. A ministry of marine was constituted.

NIEDERFULLBACH FOUNDATION. The difficulty over the Niederfullbach Foundation, which had been in the courts since the death of King Leopold, entered on a new phase in May, when the Coburg government took up the question. A report of the Coburg government denied the jurisdiction of Belgian courts over the "Foundation," and demanded that Belgium should restore the properties. It urged the government to appeal to the Bundesrath, to negotiate with the Brussels government on the subject. The interest of Coburg in the affair lay in the fact that it would derive a revenue from the taxes upon the foundation.

BENT, SAMUEL ARTHUR. An American lawyer and author, died November 22, 1912. He was born in Boston in 1841 and graduated from Yale College in 1861. After studying law he was admitted to the bar in 1865. From 1872 to 1874 he was American editor of the Swiss (Geneva) *Times* and Galignani's (Paris) *Messenger*. From 1878 to 1886, he was superintendent of schools in Nashua, N. H. He was secretary and treasurer of the Bostonian Society from 1890 to 1899 and several times served on the Boston School Committee. He was greatly interested in historical matters and wrote *Familiar Short Sayings of Great Men* (1882); *Hints on Language* (1883); and *Notes to the Golden Legend* (1886).

BEREA COLLEGE. An institution of higher learning at Berea, Ky., founded in 1855. Its chief educational work is carried on among "mountain whites." The enrollment in the several departments in the autumn of 1912 was as follows: College, 95; normal, 96; model school,

214; academy, 233; vocational school, 117; foundation school, 222. The larger portion of the normal school students were absent during the fall term teaching among the mountains. The faculty in all departments numbered about 50. Among the new appointments for 1912 were those of Rev. Charles F. Hubbard, D. D., professor of Latin and dean of the college; Professor Frank E. Howard, Ph. D., professor of education in the normal department; and Frank Montgomery, M. S., instructor in animal husbandry and investigator in mountain agriculture. There were no noteworthy benefactions received during the year. The productive funds of the college amount to \$1,040,000, and the income to \$65,000. There are about 27,000 volumes in the library. President, William Goodell Frost, Ph. D., D. D.

BERGSON, HENRI. See PHILOSOPHY.

BERIBERI. Little calls attention to the fact that beriberi is very prevalent in Newfoundland, and is satisfied that it is due to the fine (overmilled) white flour. Although often complicated by starvation, exposure, and scurvy, many cases are clearly of the neuritic type. The symptoms vary in severity from numbness and tingling of the legs and arms (paræsthesia) to night blindness, retention of urine, sensory and motor paralysis, involvement of the nerves of the heart, œdema, and death. Little has proved clinically that such cases recover on a diet of whole wheat flour, and his findings reinforce the milled rice theory of the causation of beriberi in the East. But he shows also that it is not any particular grain that is at fault, but the removal of the pericarp in milling.

At the annual meeting of the Far Eastern Association of Tropical Medicine at Hongkong beriberi occupied a prominent place in the discussions. The views of American, English, French, and Japanese investigators were nearly unanimous in favor of the dietetic, as opposed to the infectious, origin of the disease. While rice polishings or an extract thereof have been found almost a specific in the cure of the malady, numerous attempts to isolate the active principle were unsuccessful. Chamberlain and Vedder, army sanitarians in the Philippines, reported that they had found the disease common in nurslings, the children of mothers suffering from beriberi. The symptoms resembled somewhat those observed in adults, and began with vomiting followed after a few days by great restlessness, sleeplessness, continual whining, and still later by dyspnea, rapid pulse and œdema of the face and extremities. Still later oliguria and aphonia developed in many cases. To these infants was given extract of rice polishing in 20-drop doses every two hours while awake. Improvement began within twenty-four hours, and in a week all the symptoms disappeared except the aphonia, which often lasted for two months.

BERLIN. See ARCHITECTURE.

BERMUDA. A group of islands (about 300) lying about 500 miles to the east of Cape Hatteras. Area, about 19 sq. miles; population (1911 census), 18,994 (12,303 colored). Hamilton (the capital) had 2627 inhabitants; St. George's, 1079. During the year ending May, 1912, about 20,000 tourists entered the colony. Nearly three-fourths of the area is unfit for cultivation. The remainder is utilized for the production of early spring table crops, for ex-

port to the United States. There are no railways.

BEVERIDGE, ALBERT J. See PRESIDENTIAL CAMPAIGN AND INDIANA.

BIBLE SOCIETY, AMERICAN. An organization founded in 1816 for the encouragement of a wider circulation of the Holy Scriptures without note or comment. The ninety-seventh year of the society was a successful one. Its work continually expanded and its one hindrance was a lack of funds. One of the most important developments of the work of the society is that connected with its "home" agencies. These continued without interruption in 1911-12 with many marks of success. These agencies circulated during the year 646,625 Scriptures. The agency among the colored people of the South reached the largest circulation ever attained, 41,267 copies. Other agencies are the Northwestern Agency, covering the States of Illinois, Indiana, Michigan, Wisconsin, Minnesota, Iowa, Nebraska, North Dakota, and South Dakota; the South Atlantic Agency, embracing the States of Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida; the Western Agency, embracing the States of Missouri, Kansas, Colorado, Idaho, Montana, Utah, Wyoming, New Mexico, and Arizona; the Southwestern Agency, embracing the States of Texas, Oklahoma, Louisiana, and Arkansas; the Pacific Agency, including the States of California, Oregon, Nevada, and Washington; and the Central Agency, including within its field the States of Ohio, Kentucky, Tennessee, Alabama, and Mississippi. The "foreign" agencies of the society are in the West Indies, Venezuela, Mexico, Central America, Brazil, Siam, China, Japan, Korea, and the Philippines. The total issues at home and abroad during the year were 3,691,201 volumes. These issues consist of 430,093 Bibles, 670,728 Testaments, and 2,590,375 portions of the Scriptures. This is the largest distribution made in any year of the history of the society. Of the total issues, 1,837,356 volumes were issued from the Bible House in New York, and 1,853,845 by the society's agents abroad. The total issues of the society for ninety-six years of its existence amount to 94,219,105 volumes. New translations of the Scriptures included one in the Ibanag dialect of the Philippines. This translation was of the New Testament. The society also coöperated with the British and Foreign Bible Society in a revision of the Tagalog New Testament. The American Bible Society joined with the American Baptist Foreign Mission Society in bringing out the Old Testament in Panayan. There were other translations of portions of

the Scriptures in dialects of the Philippine Islands. The Book of Acts was brought out in addition to Mark, Luke, and John as the beginning of the Kurdish New Testament. Translation was also carried on in Chinese and the Siamese languages.

Mr. James Wood, since 1896 a member of the board of managers, and for the last eight years a vice-president of the society, was elected its president to succeed Theophilus A. Brouwer, who died June 15, 1911. The principal receipts of the society in 1911-12 were as follows: From individuals, \$25,528; from churches, \$60,783; from auxiliaries, \$13,769, making a total of \$100,081. The receipts from legacies were \$224,701, and the income from trusts and available investments was \$121,184. The society received from the sale of its books \$238,522. The total receipts available for current work amounted to \$691,347. The total expenditures for the year amounted to \$734,494.

BICYCLING. See CYCLING.

BIEBERSTEIN, BARON ADOLF MARSHALL VON. A German diplomat, died September 24, 1912. He was born in Karlsruhe, in the Grand Duchy of Baden, in 1842. He was educated at the Frankfurt Gymnasium and at the University of Heidelberg. He entered the diplomatic service and up to the retirement of Bismarck in 1890 his career was unmarked by any unusual occurrence. In 1890 he was made secretary of state for foreign affairs in particular charge of the details of commercial treaties. During his term of office he brought about many treaties with foreign nations, most of which, with slight modifications, are still in force. He was appointed Prussian minister of state in 1894. He had already gained such a reputation for skill and diplomacy that in 1897 the emperor in recognition of his abilities appointed him ambassador to Turkey. He held this office for more than thirteen years and greatly enhanced his reputation. During his stay in Constantinople he was frequently called to Berlin for conferences with the emperor in regard to matters which had to do not only with German policy in Turkey but with the general foreign policy of the country. It was generally understood that he would have succeeded Count von Bülow as imperial chancellor but for the fact that a man of Bieberstein's calibre was needed in Constantinople to maintain the domination of Germany in Turkey. As the result of his skillful diplomatic manoeuvring he gained for Germany the supremacy in Turkey once held by England. Most of what he accomplished, however, was undone by the revolution of the Young Turks and the Turco-Italian War.

Von Bieberstein is said to have inspired the emperor to write the telegram of sympathy to President Krüger of the Transvaal at the outbreak of the Boer War. It was said, too, that he was chosen by the emperor to see that peace developments at The Hague should not take a course that might embarrass German plans. During The Hague conference, von Bieberstein's position was often in marked opposition to that of the British delegates. In June, 1912, he was made German ambassador to Great Britain. At that time his reputation was greater than that of any other German diplomat. His transfer was heralded as proof of the German decision to change its foreign policy toward both England and Turkey.

BIJAGOZ. See PORTUGUESE GUINEA.

BILLIARDS. The billiard performances of 1912 were disappointing as far as the professional matches were concerned, but the showing made by the amateurs was excellent. Among the amateurs the player who stands out most prominently is Mortier, the winner of the international 18.2 balk line tournament held at Paris from March 21 to April 3, Mortier's grand average was 17.33, his best single average 40, and his highest run 178. The comparison of these figures with those registered by William F. Hoppe, who again won the 18.2 balk line professional championship, is interesting. Hoppe's grand average was 18.80, his best single average 29 7-17, and his highest run 122. Hoppe's best showing during the year was made in his 18.2 balk line match with George Sutton in February, when he established an average of 29.45. O. C. Morningstar made the record run of the year, 167 in the tournament held in November. Another amateur deserving of mention is J. F. Poggenburg, who ranked next to Mortier in performance figures. Poggenburg was able to finish not better than eighth in the Paris tournament, but won the American international championship after a tie with Charles F. Conklin. Poggenburg's best grand average was 13.31, his best single average 28.57, and his highest run 149.

In the American amateur championships Morris D. Brown was the victor, with an average of 12.12 and a high run of 88. The entries in this tournament included Percy Collins, Poggenburg, Conklin, J. Mayer, Dr. W. G. Douglas, and Dr. W. E. Uffenheimer. The class B championship was again won by George P. B. Clarke and the class C championship by Clyde B. Terry. The increasing popularity of the three-cushion game has led the amateurs to arrange a championship tournament this year (1913). In the professional three-cushion matches of 1912 Alfred de Oro lost his championship title to John W. Carney, who in turn bowed to the prowess of John D. Horgan. De Oro, after losing his title as champion in pool, now known as pocket billiards, to Edward Ralph in April, regained it by defeating Ralph in November. An amateur tournament also was held, which was won by Arthur B. Hyman.

BINGHAM, HENRY HARRISON. A member of Congress from Pennsylvania, died March 23, 1912. He was born in Philadelphia in 1841 and graduated at Jefferson College in 1862. He studied law for a short time, but deferred this to enlist in the Federal army as lieutenant in the 140th Pennsylvania Volunteers. He was three times wounded in action. In 1866 he was mustered out of service after having been brevetted for distinguished gallantry major, lieutenant-colonel, colonel, and brigadier-general. He received a medal of honor for special gallantry on the field of battle. In 1867 he was appointed postmaster of Philadelphia, and resigned in 1872 to become clerk of courts, to which office he had been elected by the people, and was reelected in 1875. He took a prominent part in politics and was a delegate at nearly all the Republican national conventions from 1876 to 1904. He was elected to the 46th Congress and was reelected to successive Congresses, including the 62d. His term of service in the House of Representatives exceeded that of any other member and he was popularly known as "the father of the House."

HEREDITY. The year 1912 was marked by no strikingly new methods of attack on biological problems such as those of a decade or more ago, when the rediscovery of Mendel's law started an immense amount of work on heredity and allied subjects. (See YEAR BOOK for 1907.) There was, however, no decrease in the interest in these subjects, as was indicated by the large number of publications dealing with them. Most writers have apparently accepted the doctrine of unit characters, which may in inheritance be separated and recombined as if they were separate entities, though a few have protested against this assumption as contrary to fact. If the offspring of a cross exhibit a blending rather than a selection of one or the other of opposed characters, it would seem as if the hypothesis should be modified. Precisely this blending is claimed by Cunningham, who in experiments on crosses between the silky and the jungle fowl got results which led him to doubt if recessive characters derived from crosses are ever pure, as they should be if the Mendelian assumption is accurate. Cunningham thinks that the Mendelians are too anxious to discover, or invent, factors whose segregation would agree with the observed results, and suggested the desirability of research in the investigation of the divisibility of "real" characters. Morgan, continuing his work on fruit flies, found new illustrations of sex limited inheritance (see YEAR BOOK for 1911), while Strong, in breeding ring doves, found that blond males and white females gave blond hybrids which were mostly male, while the offspring of the reciprocal cross gave blond and white in about equal numbers, indicating that white is a sex limited character. Strong thought that the male is heterozygous for sex, while the female is homozygous. Davenport, reviewing the results obtained by experimental breeders, on the one hand, and by students of centrosomes on the other, in the matter of sex limited inheritance, concluded that these converging lines of attack demonstrate results which "constitute one of the greatest advances made in biology during the present decade, if not in the history of science." Davenport found his results so nearly in agreement with those obtained by other workers that he was able to state as definite laws: (1) The male carries two sex chromosomes and the female one; (2) determiners for secondary sex characters are centred in the sex chromosomes; (3) aside from secondary sex characters whose determiners are located in the sex chromosomes are others whose development is especially influenced or modified, probably by secretions of the sex glands. Pearl, in a lengthy paper on the inheritance of fecundity in the domestic fowl, stated that fecundity in this animal is inherited strictly in accordance with Mendelian laws, and that individual variations in fecundity depend upon two separately inherited physiological factors, L_1 and L_2 , high fecundity appearing only when both are present in the

same individual. One factor, L_2 , is sex limited in that it does not appear in any gamete which carries the female sex determiner. In determining fecundity, the male is as important as the female, so that mere selection of females alone would never lead to a racial increase in fecundity. Pearl suggested further that the diminishing birth rate in man might conceivably be explained on the assumption of the loss of one or more of the genes upon the presence of which high fecundity depends. Jordan, discussing human heredity, gave reasons for believing that left-handedness, a tendency to tuberculosis, and nephritis are probably inherited according to Mendel's laws. A further suggestion made by Jordan was that possibly finger print patterns might be inherited in the same fashion, which, if true, would be of importance in deciding questions of disputed parentage.

While perhaps the majority of workers believe that whatever be the material carrier of heredity quantities, they are situated in the chromatin of the sex cells, others have objected that in the spermatozoon the middle piece carrying the centrosome enters during fertilization and may contain some of this heredity material. In a series of remarkable experiments Lillie was able, using the centrifuge, to remove any part or all of the middle piece of the spermatozoon of an annelid *Nereis*, during the act of fertilization, while the head continued to enter the egg and produced a perfectly normal sperm pronucleus with a normal centrosome. Since the head of the spermatozoon is practically nothing but chromatin, and since in these cases only the head entered, yet produced perfectly normal division, it would seem as if the head is really the important portion of the spermatozoon. That a centrosome appeared in connection with this nucleus, though normally coming in with the middle piece, indicates that the centrosome is not a permanent organ, but is formed anew at each division by some forces at work in the egg. Wilson, writing from the point of view of the cytologist, took a strong position concerning the reality of unit characters. The existence of such characters, which may be independently combined, disassociated, and recombined, he regarded as definitely proved. These unit characters are dependent upon separate material bodies or substances, and these substances are the chromosomes. A unit character may be due to the coöperation of several unit factors, and different unit characters appear as unit factors are added to, or subtracted from, a given combination in the zygote. These unit factors play their specific rôle only as they form part of a still more general apparatus of ontogenetic reaction that is constituted by the organism as a whole. Thus it is not possible to speak of characters as borne by "determiners." They appear as responses of the germinal organization operating as a unit system. Wilson compared the results of combining these factors with the action of a chemist in altering the quality of a protein by addition, subtraction, or substitution of one or more side chains. Wilson thought that the chromosomes furnish a material basis for carriers of these factors.

EUGENICS. Much work was done in the investigation of eugenic problems during the year, though especially from the sociological

point of view it was urged that environment rather than heredity is responsible for human character, thus continuing the old controversy of *Eugenics versus Euthenics*. Davenport, at Cold Spring Harbor, in addition to his own investigation, has for the last two summers conducted a training course in methods of eugenic investigation at the biology laboratory of the Brooklyn Institute. The first international eugenics congress was held in London from July 24th to July 30th, with Leonard Darwin as president. See **EUGENICS**.

MUTATION. As was stated in the **YEAR BOOK** for 1911, Davis believed that *Enothera lamarckiana*, which furnished most of the evidence on which de Vries based his mutation hypothesis, is really a hybrid, and the mutants appearing in its cultures are really the reappearance of component species. In 1912 Davis published later results of his experiments which seemed to indicate that by combining *Æ. biennis* and *Æ. grandiflora* he was able to produce forms taxonomically belonging to *Æ. lamarckiana*. If this be true, de Vries's mutants are really variants due to the mixing of different protoplasm, and *Æ. lamarckiana* is really heterozygous rather than homozygous. On the other hand, Swarczewsky, comparing the mutations of various species of *Enothera*, concluded that *Æ. biennis* exhibits mutations similar to those of *Æ. lamarckiana*, indicating that the mutations of the latter are older than the species and must not be regarded as arising from a splitting of hybrids. Osborn, from the standpoint of the paleontologist, declared against the idea that species ordinarily arise through mutation, and stated that all absolutely new characters which we have traced to their beginnings in fossil mammals arise gradually and continuously. Discontinuity in inheritance, which is what is observed by the morphologist, does not prove discontinuity in origin, and all paleontological evidence is against the latter assumption.

SELECTION. Davenport questioned whether in evolution advance can ever be made by personal selection, and decided that this must still remain an open question. Swamping by intercrossing, he declared, occurs very rarely, if at all. A new character depending on many determiners may appear, but no true blend occurs, and the original characters may again segregate. Castle, however, thought that in some characters, as coat color in rats, it is possible to permanently modify the character by selection in each generation. As a result of this selection the mean shifts in each generation thus opposed to the pure line concept. Alexander Graham Bell reported that in his flock of sheep in Nova Scotia he had been able by selection to produce a race of six-nippled sheep in which there was a marked tendency toward the production of twins.

INHERITANCE OF ACQUIRED CHARACTERS. Przibram in an article, "Die Umwelt des Keimplasmas," stated that the question as to whether characters appearing in response to environmental changes will appear in their offspring under similar conditions, must now be answered in the affirmative, and as to the method of this transference there are three possibilities: (1) New characters may arise because of germinal variation; (2) they may arise first in the soma and by it be impressed on the germ plasm; (3) both soma and germ

plasm may be simultaneously affected by the same external stimulus. To decide this question Przibram proposed a coöperative inquiry as to how far external agencies could directly affect germ plasm. That is, how far can light, heat, etc., penetrate the body and act directly on the germ plasm? Seecorv, working with salamanders, found that photographic paper enclosed in a tube and put in the body of a salamander in the position occupied by the sex organs would, if the animal was exposed to light, be affected by the light rays. Congdon determined the rectal temperature of rats and found certain variations under certain conditions, but reached no definite conclusions as to the possibility of the sex organs varying in temperature. This would seem more probable in the male than in the female, as the male organs are more exposed.

SEX DETERMINATION. The most important theories concerning the determination of sex are on the one hand, those that regard sex as determined by the environment of the developing embryo, and on the other hand those that consider sex is determined not later than the time of the fertilization of the egg, probably by the presence of a peculiar chromosome or combination of chromosomes. Guyer (see **YEAR BOOK** for 1910) thought he had found an accessory chromosome in the spermatogenesis of man, indicating a chromosomal determination in the human species. Gutherz, in 1912, studying similar material, was unable to find any trace of an accessory chromosome, so that the question as to determination of sex in man must be regarded as still an open one. Miss King, continuing experiments on the question of sex determination in amphibians, treated the eggs of toads with hypertonic solutions of sugar and salt. The proportion of females developing from these eggs was slightly greater than in the control, indicating that perhaps the egg may be heterozygous in regard to sex. Extraction of water also tended to produce a larger proportion of females. Miss King concluded from her results that in the toad there is no evidence for a chromosomal control of sex. In earlier years Geoffrey Smith had discovered that crabs infested with a parasitic crustacean, *Sacculina*, would change their secondary sex characters from male to female. Smith continued these observations in 1912, and his results indicated that the roots of the parasite elaborate from the blood of the host a pigmented yolk substance similar in every way to the yolk material formed by the ovary when ripening. Thus the parasite produces changes by acting in exactly the same fashion as does the developing ovary. Riddle reported that C. O. Whitman had been able to control sex and color in pigeons. He used light and dark colored birds as respective parents, and removed eggs as fast as laid to other birds, thus forcing them to their maximum egg production. All of first several pairs of eggs produced dark male hybrids. All of last several pairs produced light female hybrids. In between is a period in which he was not able to predict the result of any crossing. Whitman did not use Mendelian phraseology, but stated in such terms, one may say that he was able to shift, control, or determine, experimentally, the dominance of sex and color.

The whole literature of the subject of sex determination was reviewed by Hertwig in

Biologisches Centralblatt. Hertwig apparently concluded that there are male and female producing spermatozoa, and that the chromosomes may have a determining action, but considered that these may be modified or destroyed in their action by environmental conditions.

VITALISM AND MECHANISM. Schäfer, as president of the British Association for the Advancement of Science, at its meeting in Belfast, discussed in a part of his presidential address the question as to the origin of life from non-living, and apparently regarded it as not impossible that such a process may be eventually carried on experimentally, though his assertions were too guarded and conservative to warrant the interpretation given them in the public press. Schäfer evidently considered it possible that a process of origin of new living matter may be going on at the present time, though if it is going on at all it is quite as likely to be taking place on land as in the sea. The geologist would have no evidence of this process, nor is it probable that the microscopist would be able to see the organisms that arose in this way. Under the title "The Mechanistic Conception of Life," Loeb published in 1912 a collection of essays relating to his thesis that life is really a chemical and physical process and that we may hope to eventually explain it in chemical and physical terms. We must, he said, either produce living matter artificially or we must find the reason why it is impossible.

Loeb thinks that activation of the egg by the spermatozoon is now practically reduced to a physico-chemical process, the sperm starting the egg to develop by accelerating the oxidations. The life of the individual begins, therefore, when the oxidations in the egg are accelerated. Death follows if the oxidations cease. He resolves all animal activities into tropisms, and maintains that here we have a strictly scientific basis for all our so-called higher mental and ethical processes. "We eat, drink, and reproduce not because this is desirable, but because, machine-like, we are compelled to do so. . . . We struggle for justice and truth since we are instinctively compelled to see our fellow beings happy. Not only is the mechanistic conception of life compatible with ethics: it seems the only conception of life which can lead to an understanding of the source of ethics."

Jennings showed that Driesch's vitalism theory is opposed to the experimental method, because it is impossible, according to it, to predict the action of the entelechy. Even though one may have determined the action of a given set of physical compounds, one would have no certainty that the action would be the same at a subsequent time, because a different entelechy might be in control.

BLAIR, CHARLES AUSTIN. An American jurist, died August 30, 1912. He was born in Jackson, Mich., in 1854, and graduated from the University of Michigan in 1876. He studied law and in 1878 was admitted to the bar. In 1882 he was elected city attorney of Jackson, and in 1895-6 he served as prosecuting attorney of Jackson county. In 1903-4 he was attorney-general of the State. In the latter year he was appointed associate justice of the supreme court of Michigan.

BLAKE, EDWARD. A Canadian statesman, died March 1, 1912. He was born in Middlesex county, Ontario, in 1833, and was educated in Upper Canada College and Toronto University. After studying law he was called to the bar in 1856. At the time of the confederation of the Provinces in 1867 he was elected both to the Canadian House of Commons and to the Provincial Legislature. He was at once offered the leadership of the Provincial Opposition, but at that time declined. He accepted the leadership, however, two years later and on the defeat of the Provincial Conservatives in 1871 became Liberal prime minister of Ontario. In the year following it was made illegal to sit in both the Federal and Provincial Parliaments, and Blake retired from the Provincial Parliament. In 1873 as the result of an exposure, which he had done much to bring about, the federal administration of Sir John MacDonald collapsed under the Pacific Railway scandal. Mr. Blake became a member of the Liberal cabinet, which was formed by Alexander Mackenzie. He was obliged to retire in a few months on account of ill health, and in 1875 returned to the cabinet as Minister of Justice. In that capacity he was responsible for the formation of the Supreme Court of Canada, the first presidency of which he declined. On the return of Sir John MacDonald to power in 1878 Mr. Mackenzie retired, and Mr. Blake thereafter was the leader of the beaten Liberal party. In 1887 he resigned the leadership to Sir Wilfrid Laurier. While impaired health was given as the cause it was known to be a fact that Mr. Blake was uneasy about the lengths to which some of his colleagues were pushing their advocacy of closer trade relations with the United States. Some of these had adopted the cry of "unrestricted reciprocity." He refused nomination at the general election of 1891 and after the Liberals had lost that election he published a farewell letter criticising the platform of the party, especially as to its stand on reciprocity. This letter had great influence in turning Canadian sentiment against reciprocity. In 1892 Mr. Blake, on the invitation of Justin M'Carthy, entered the Parliament of Great Britain as a member of the Nationalist party. He was given a seat from South Longford. He became in 1894 a member of the executive committee of the party, and in the same year was appointed a member of the Royal Commission on the Financial Relations between Great Britain and Ireland. He was returned without opposition at the elections of 1895, 1900, and 1906. In 1907 he gave up his seat and from that year until the time of his death lived a retired life in Canada.

BLODGETT, JOHN TAGGART. An American jurist, died March 4, 1912. He was born in

Belmont, Mass., in 1859 and graduated from Brown University in 1880. After studying law he was admitted to the Rhode Island bar in 1883. He was appointed judge of the United States circuit court in 1885 and in 1895 was appointed judge of the United States circuit court of appeals. In 1890 he was United States commissioner for the district of Rhode Island and in 1892 was chief supervisor of elections in that State. He was appointed associate justice of the Supreme Court of the State in 1900.

BLUE BLACK BLOC. See GERMANY, *History*.

BLYDEN, EDWARD WILMOT. An American negro author and lecturer, died February, 1912. He was born in St. Thomas, West Indies, in 1832 and after studying theology became a Presbyterian minister. For a time he was president of Liberia College. He was later appointed Liberian secretary of state for the Interior and Liberian minister at London. He wrote several books on the negro in Africa.

BOAS, EMIL LEOPOLD. An American steamship director and philanthropist, died May 3, 1912. He was born in Doerlitz, Germany, in 1854 and was educated in Breslau and Berlin. In 1878 he removed to the United States, where in New York he engaged in the banking business as representative of the firm of his uncle in Berlin. At that time this firm's office represented the Hamburg-American line of steamships and thus Mr. Boas formed a connection which finally led to his becoming resident director of this line in the United States in 1892. For his services in behalf of commerce between the United States and Europe he received many decorations from the European government. He took an active part in philanthropic and economic questions and was a member of most of the important organizations dealing with these subjects in the United States.

BOILERS. See STEAM ENGINES.

BOISE, OTIS BARDWELL. An American teacher of music, died December 2, 1912. He was born in Oberlin, Ohio, in 1844 and was educated in the public schools of Cleveland. He studied music in Leipzig and after the completion of his studies in that city settled in New York City, as a teacher of composition in the New York Conservatory and organist in the Fifth Avenue Presbyterian Church. He spent 1876 and 1877 in Europe, and resumed teaching in New York City in 1878. After seven years spent in business from 1881 to 1888 he again resumed professional work. In 1901 he was appointed head of the department of harmony and composition at the Peabody Conservatory of Music in Baltimore. He was the author of *Harmony Made Practical* (1900), and *Music and Its Masters* (1901).

BOKHARA. A Russian vassal state (83,000 square miles, about 1,500,000 inhabitants) in Central Asia. Capital Bokhara.

BOLAMA. See PORTUGUESE GUINEA.

BOLIVIA. An interior South American republic. Sucre, the seat of the supreme court, is called the capital; but the president resides at La Paz, where the Congress convenes and the foreign diplomats are stationed.

AREA, POPULATION, ETC. The area is officially estimated at 1,379,014 square kilometers (532,437 square miles) or, including territory within disputed boundaries, 1,458,034 square kilometers (562,947 square miles). No census

has been taken since that of 1900, which showed 1,744,568 inhabitants; but the estimated population in 1912 was 2,450,000. Of the inhabitants in 1900 50.9 per cent. were returned as Indian, 26.7 mestizo, 12.7 white, 0.21 negro, and 9.4 unclassified. The great elevated plateau of western and central Bolivia contains most of the larger towns. Municipal populations are reported as follows: La Paz, 94,568; Cochabamba, 28,650; Potosí, 25,000; Sucre, 23,500; Oruro, 23,800; Santa Cruz, 21,500. In 1910 elementary schools, public and private, numbered 717 (1299 teachers and 46,000 pupils); 18 secondary schools (126 and 1631); 17 institutions for superior instruction (65 and 680). The number of pupils in all educational institutions in 1911 is reported at 84,288. The State religion is Roman Catholicism.

PRODUCTION AND COMMERCE. The less sparsely peopled portion of Bolivia is distinctively a mining country. Crops include corn, rice, barley, and potatoes, but they are of little commercial importance. In the north rubber is produced in considerable quantities. The principal minerals now in exploitation are tin, silver, bismuth, and copper. In output of tin ore Bolivia ranks next after the Federated Malay States. Livestock (1910): Cattle, 734,535; horses, 96,867; sheep, 1,454,729; mules, 44,635; asses, 174,090; goats, 473,370; swine, 114,147; llamas, 428,209; alpacas, 112,033.

Imports and exports have been as follows:

	1906	1907	1908	1909	1910	1911
Imports	31,997	34,562	33,069	36,937	48,802	58,371
Exports	50,757	45,902	58,924	63,764	74,567	82,631

Classified imports in 1911: Animal substances, 9,081,844 bolivianos; vegetable substances, 12,497,512; mineral substances, 19,992,494; textiles and their manufactures, 7,219,180; paper, 1,607,052; drugs and chemicals, 577,157; beverages, 2,191,838; machinery, apparatus, etc., 2,554,661; vehicles, 561,275; arms and explosives, 2,026,414; unclassified, 61,980; total, 58,371,409. Classified exports in 1911: Mineral substances, 62,532,010 bolivianos; vegetable substances, 19,499,725; animal substances, 298,022; live animals, 102,389; animales disecados, 8500; manufactured products, 51,113; productos nacionalizados, 101,814; various, 37,599; total, 82,631,172. Principal specific exports in 1911 (values for 1910 in parenthesis): Tin, 60 per cent. barilla, 37,073 metric tons, valued at 52,639,603 bolivianos (38,548 tons, 37,006,504 bolivianos in 1910); silver, 5,379,253 bolivianos (5,269,942); bismuth, 50 per cent. barilla, 415 tons, 2,106,162 bolivianos (1,923,417); copper, 80 per cent. barilla, 2950 tons, 1,426,943 (1,786,952); wolfram barilla, 297,272 tons, 231,188 (141,629); zinc, 9798 tons, 372,490 (435,009); unconcentrated bismuth, 140,639 tons, 111,889 (43,178); rubber, 3646 tons, 18,921,192 (3007 tons, 26,825,231 bolivianos); coca, 252 tons, 511,051 (420,105); cueros vacunos, 324 tons, 259,182 (218,163).

COMMUNICATIONS. Railways in operation in 1911 aggregated 1022 kilometers (635 miles). A large railway extension has been undertaken, and the mileage was greatly increased during 1912. It was expected that the Viacha-La Paz line would be completed in February, 1913. The work was well advanced in 1912 on the Oruro-Cochabamba, Unywini-Tupiza, Mulatos-Potosí, and other lines. Telegraph lines (reported

1911), 5007 kilometers (3111 miles); offices, 161. Post offices, over 200.

Trade by countries, in thousands of bolivianos:

	Imports		Exports

FINANCE. The monetary standard is gold, pursuant to the law of September 14, 1906; monetary unit, the boliviano, par value 38.932 cents (12.5 to the pound sterling). Estimated ordinary revenue and expenditure: 1909, 13,300,000 and 16,454,625 bolivianos; 1910, 13,540,000 and 13,887,435; 1911, 13,141,175 and 17,805,859; 1912, 17,237,100 and 17,356,552. Estimated receipts for 1912 included: Import duties, 7,668,000 bs.; export duties, 3,687,100; taxes, 2,548,000. Estimated expenditures: Foreign affairs and worship 948,489 bs.; interior, 3,114,179; commerce and finance, 4,795,135; justice and industry, 1,270,102; war and colonization, 4,983,416; instruction and agriculture, 1,871,609. The foreign debt on June 29, 1912, amounted to £1,937,805, having been reduced by £27,545 in a year. Internal debt in 1912, 4,208,069 bs.; floating debt, 2,034,989 bs.

GOVERNMENT. The president, who with two vice-presidents, is elected for a term of four years, is assisted by a cabinet of six ministers. Congress consists of the Senate (16 members) and the Chamber of Deputies (75). The president in 1912 was Eliodoro Villazón (for the term beginning August 12, 1909); first vice-president, Macario Pinilla.

BOLL-WEEVIL. See **COTTON.**

BOLLER, ALFRED PANCOAST. An American engineer, died December 10, 1912. He was born in Philadelphia in 1840 and graduated from the Rensselaer Polytechnic Institute in 1861. After acting as engineer with several railway and other corporations, he became in 1865 chief engineer for the Hudson River Railroad. This position he left to engage in the iron business with Samuel Milliken as New York agents for the Phoenix Iron Company. In 1870 he became vice-president and engineer for the Phillipsburg Manufacturing Company and retained this position for twenty years. During the same period he was consulting engineer for railroads in Haiti and Cuba as well as chief engineer for the Manhattan Railroad Company and consulting engineer for the department of public works of New York City. In 1898 he entered into partnership with Henry W. Hodge, forming the firm of Boller & Hodge. He was one of the most eminent engineers in the United States.

BONAH. See **ARCHÆOLOGY.**

BONBRIGHT, DANIEL. An American educator, died November 27, 1912. He was born in Youngstown, Pa., in 1831, and graduated from Yale College in 1850. From 1854 to 1856 he was a tutor at Yale, and in the two years following studied at the universities of Berlin, Bonn, and Göttingen. In 1858 he became pro-

fessor of the Latin language and literature at Northwestern University. He was appointed dean of the faculty of liberal arts at that university in 1899, serving until 1902. From 1900 to 1902 he was acting-president of Northwestern University.

BOOTH, WILLIAM. Commander-in-chief of the Salvation Army, died August 20, 1912. He was born in Nottingham, England, in 1829, the son of a carpenter, who, by dint of strict economy, contrived to give his son educational advantages and send him to a private theological tutor for preparation for the Methodist ministry. At 23 years of age William Booth became pastor of a small chapel in Nottingham. Although he was not at this time a gifted speaker and did not seem especially qualified for evangelical work, he plunged into this field with great zeal. Shortly after his admission to the ministry, he traveled over England on itinerant preaching tours and during one of these met Catherine Mumford, to whom he became engaged. For many years he endeavored to make money enough to justify their marriage, but this did not take place until 1856. Mrs. Booth was in many ways no less remarkable than her husband. She had the same religious zeal and a kindred instinct for organization. For five years after their marriage they lived the precarious existence of revivalists. Finally they found themselves in London in the darkest part of the slums in the vicinity of Whitechapel and Shoreditch. Here William Booth conceived the idea of bringing light into the hopeless lives of those who dwelt in this part of London. He laid a plan of campaign, before the Methodist New Connection Church, but this body found it too radical. Thereupon Booth, who now had three small children and his wife to support, cut loose from orthodoxy and set about preaching to the people of the slums in his own way. Those whom he chose to lead were not only of the very poor, but the very criminal, the lowest dregs of the great city.

In 1865 he settled with his family in Mile End Waste, one of the blackest corners of East End, London. Here he began the work of saving souls by a new method. His first tabernacle was a second-hand tent, erected in a disused burying-ground, on Mile End Road. This he called the Christian Mission, and in this place the Salvation Army was born.

During the years of his ministry in Whitechapel, Booth came more and more to fit his evangelical methods to the temper and understanding of the people who listened to him. He saw that the love of show and parade attracted the inhabitants of those mean streets and he began to introduce features of display. Finally, in 1878, from a number of faithful adherents, whom he had redeemed from the slums, he organized the Salvation Army, a band of not more than one hundred, and to these he gave uniforms, flags to carry, and drums and cornets for music. The first appearance of this little band on the streets of Whitechapel was attended by a riotous demonstration on the part of the lookers-on, in many cases the police siding with the roughs and arresting the Salvationists for obstructing the highways. When reports of this method of evangelizing reached

WILLIAM BOOTH
FOUNDER AND HEAD OF THE SALVATION ARMY
Died August 20, 1912

Udacity

Mr. U

the ears of the clergy in the fashionable congregations they bitterly denounced the "vulgar sensationalism" and "irreverent trumpery" of this Salvation Army. In spite of this double opposition, Booth continued steadfastly in his work and before a year had passed, there were 127 officers in the Salvation Army, and 81 corps had been established throughout England. The military form of government was prescribed and Booth gave himself the title of "General," while the officers below him were given titles with rank corresponding to that in the regular army.

Before the Salvation Army was four years old, General Booth and his wife began a long series of social reforms and charities, which, with the Salvation Army of to-day, stand as their monuments. One of the first of these reforms was the prison-gate mission. This consisted in the establishment of pickets of the army, who should stand at the portals of the prisons and give counsel and aid to criminals who had served their terms and were being turned out of the prisons. Food stations, supported by voluntary contributions, distributed meat to the starving, training schools were established where those who were regenerated could learn honesty and self-reliance and could be fitted to be officers of the Army.

Opposition to the work of General Booth among members of the clergy continued until 1884, when Queen Victoria made public a message which she had sent to him, warmly commending his work. After that Canon Farrar, who had been among its bitterest opponents, gave his approbation to General Booth's movement, and cordial support was also given by Cardinal Manning.

With the growth of the Army came the development of General Booth's insistence upon what came to be practically a military despotism. This development came with the increase of the Army's forces and the widening of its influences. From the beginning, General Booth, first at the head of his large family of active workers, and then as supreme in command, directed every move, received all reports from subordinates, and appointed himself custodian of all funds. Title to all property owned by the Salvationists in all parts of the world either stood in his name or was held in trust by him. The insistence on the supreme control over the affairs of the Army resulted in what was probably the greatest grief of his life, the breach between himself and his son, Ballington Booth, who had been given command of the Salvation Army in America. Ballington Booth, with his wife, Maude Ballington Booth, threw himself into the work in the United States with great energy, but he found himself hampered by the dictatorship of his father. General Booth in turn declared his son too independent and not at all amenable to discipline from London. Early in 1906 General Booth peremptorily recalled Ballington Booth, from his command in America. Ballington Booth, instead of obeying, seceded from the Army in the spring of 1906 and established another organization called "The Volunteers of America." He issued a statement in which he declared that General Booth had drawn upon the funds of the American Army to keep up the exchequer in Canada and elsewhere, that he had spoken slightly of American, and that his orders directed to the commander in America had all been prejudicial to the organization in the United States. Gen-

eral Booth and his son were estranged until the former's death.

General Booth traveled in the interest of the Salvation Army all over the world. He visited the United States and Canada five times. He made two tours of India and three journeys to Australia and South Africa. He also spent some time in Japan where he was given an audience with the Emperor. He was received also by most of the royalties on the continent of Europe.

In addition to his work as active head of the Salvation Army, General Booth wrote and published several books. The best of these was *Darkest England and the Way Out*, published in 1890. In this book he set forth his theory for the care and cure of the congested criminal classes in the slums of the great cities through farm colonies. These theories were put into practice by the Salvation Army with more or less success. The best known of his other works are, *Love, Marriage and the Home*, *The Training of Children*; *Religion for Every Day*; *Letters to My Soldiers*, and *Salvation Soldiers' Visions*. He also founded the *War Cry*, the official paper of the Salvation Army, and many other periodicals which are published under Army auspices. The last four years of General Booth's life were clouded by the failure of his eyesight and weakened health. For a year before he died he was practically without the use of his eyes. Shortly after his death a paper which he had prepared and sealed many years before, was opened and it was found that he had named as his successor, Herbert Bramwell Booth, who for many years had been his father's chief aid in the conduct of the affairs of the Salvation Army.

BOOTS AND SHOES. The boot and shoe industry in 1912 was fairly prosperous, all things considered, and business was steady through the year, with prices advancing with those of leather. Calf shoes were in most active demand during the year and were the favorite variety. The agitation in connection with the proposed change of tariff continued, and with the election of a Democratic President and continued Democratic majorities in Congress, it was believed that an attempt would be made to reduce or repeal the duty on shoes. When the duty on hides was abolished in 1909 the tariff on boots and shoes was reduced to 15 per cent. if the uppers were made of kid and 10 per cent. if the uppers were made of calf or side leather. It was conceded that the superiority of American shoe factories, both in equipment and labor, was such as to make the industry independent of protection, except on the score of wages, which were reported 50 per cent. cheaper in Europe than in the United States. American superintendents and foremen had been called to Europe to organize and superintend plants in which American machinery had been set up, and the shoe manufacturers in the United States feared that they would be unable to compete with European labor and maintain the present schedules of prices. It had been argued that when the duty on hides was repealed that shoes would become cheaper, but this prediction had not been realized, as notwithstanding the free importation of hides their price had steadily appreciated.

The question of substitution in the sale of boots and shoes continued to be discussed during the year, and in several State legislatures, as well as in Congress, bills of the "Pure

Food" variety were introduced, requiring the stamping on the sole of shoes where substitutes for leather were used in any part. The shoe trade opposed such legislation, both on account of the stringency of the penalties proposed and on account of the fact that it would tend to increase the price of the lower grade of shoes, in which substitutes for leather were satisfactorily used in certain parts. They claimed that it was not adulteration or fraud, and that the effect would be to increase the price of the cheaper grades of shoes, where durability was one of the most essential elements in their commercial success.

In 1912 Haverhill, Mass., shipped 571,991 cases of shoes as compared with 530,592 cases in 1911. Brockton, Mass., however, showed a decrease in production, and the shipments, amounting to 678,966 cases, as compared with 785,534 cases in 1911, were the lowest since 1904. The value of this production, \$47,527,620, was a decrease of \$6,470,842.50 over 1911, and a decrease in labor cost of \$1,468,741.50. In Lynn, Mass., the shoe output for the year was estimated in cost of \$30,000,000. See LEATHER.

BORAH, WILLIAM E. See PRESIDENTIAL CAMPAIGN.

BORDEN, R. L. See CANADA.

BORMANN, EDWARD. A German humorist and poet, died May 1912. He was born in Leipzig in 1851 and was educated in the Polytechnic School in Dresden and at the universities of Leipzig and Bonn. His first literary work was a series of humorous sketches in dialect contributed to the *Fliegende Blätter*. He was also the author of a book of humorous songs in High German. He wrote also many volumes of poems and stories.

BORNET, JEAN BAPTISTE EDOUARD. A French botanist, died January, 1912. He was born in Guerigny in 1828. He studied medicine in Paris, but his chief tastes were for botany, and he carried on studies, especially in fungi, under the direction of Tulasne and Leveillé. He afterwards accompanied Thuret to Cherbourg, where his attention was devoted chiefly to the study of marine algæ, with which he deals in several of his books. His works, in some of which he collaborated with Thuret, include: *Recherches sur la structure de l'éphèbe pubescens* (1852); *Recherches sur la fécondation des Floridées* (1867); *Recherches sur les gonidies des Lichens* (1873); *Notes algologiques, recueil d'observations sur les Algues* (1876-80); *Revisions des Nostocacées hétérocystées*, in collaboration with Flahault (1886).

BORRELLY'S COMET. See ASTRONOMY.

BOSNIA AND HERZEGOVINA. Provinces, formerly Ottoman, annexed to the Austro-Hungarian monarchy October 5, 1908. Area: Bosnia, 16,240 square miles; Herzegovina, 3529; total, 19,769. Population according to the census of October 10, 1910 (results of the census of April 22, 1895, in parentheses): Bosnia, 1,631,006 (1,348,581); Herzegovina, 267,038 (219,511); total civil population, 1,898,044 (1,568,092); in addition, the military population numbered 33,758 (22,944), making the total number of inhabitants 1,931,802 in 1910, against 1,591,036 in 1895. The civil population in 1910 consisted of 994,852 males (52.41 per cent.) and 903,192 females (47.59). Population according to religion: Servian Orthodox, 825,338 (43.48 per cent.); Mohammedans, 612,090 (32.25); Roman Cath-

olics, 434,190 (22.88); Jews, 11,857 (0.62); Greek Catholics, 8136 (0.43); Evangelicals (Augsburg), 5849 (0.31); Evangelicals (Helvetican), 488 (0.03); others, 96; total, 1,898,044. Movement of the civil population, 1911: Marriages, 20,763; births and deaths (each including stillbirths), 76,911 and 49,840; excess of births, 27,071. Population of Sarajevo, the capital, in 1910, 51,919; Mostar, 16,392; Banjaluka, 14,800; Tuzla, 11,333; Bjelina, 10,061; Srebrenica, 7215; Brčka, 6647; Travnik, 6517.

In 1910 there were 458 elementary schools (308 general, 143 religious, and 9 private), with 41,130 pupils, against 434 schools and 38,950 pupils in 1909. There are secondary, normal, commercial, and technical schools. In 1910 Mohammedan mektebs numbered 1970, with 2032 teachers and 64,805 pupils; in addition, 94 reformed mektebs, with 7719 pupils.

The soil is fertile, but agriculture is not highly developed. The following yields are officially reported for 1910, in metric quintals (220.46 pounds): Wheat, 727,018; rye, 100,033; barley, 824,565; spelt, 56,016; oats, 772,555; millet, 85,132; beans, 64,858; corn, 2,553,219; potatoes, 1,373,830; hay, 9,332,290; clover, 97,527; apples, 49,030; pears, 50,025; cherries, 14,258; plums, 302,400. Reported number of livestock (1910): 221,971 horses, 1,308,930 cattle, 1,393,068 goats, 2,499,422 sheep, and 527,270 swine.

Mineral output (1910): Lignite, 706,659 metric tons; iron ore, 32,721; manganese ore, 4000; chrome ore, 320. Output of metals (1910): Raw iron, 48,811 tons (valued at 3,485,070 kronen); rolled iron, 27,363 tons (4,367,220 kr.); iron castings, 5091 tons (1,058,824 kr.); lead, 18 tons (7320 kr.). Salt production, 23,579 tons (2,617,291 kr.).

Bosnia and Herzegovina are included in the Austro-Hungarian customs territory; the imports from and exports to Austria-Hungary and foreign countries in 1910 were estimated at 144,538,617 kr. and 135,458,446 kr., respectively. Railways, January 1, 1911, 1956 kilometers; telegraphs, 4102 kms. of line and 12,778 kms. of wire, with 173 offices; post offices, about 175.

Estimated revenue and expenditure for 1911, 79,129,475 kr. and 79,535,715 kr., respectively. The existing constitution bears date of February 17, 1910. There is an elective diet competent to deal with provincial finance, taxation, police, railways, public works, and law, subject to Austro-Hungarian veto. The administrative authority is entrusted to the Austro-Hungarian minister of finance (in 1912, from February 20, Dr. Leon (Ritter) von Biliński).

BOSS, LEWIS. An American astronomer, died October 5, 1912. He was born in Providence, R. I., in 1846 and graduated from Dartmouth College in 1870. From 1872 to 1876 he was assistant on the United States Northern Boundary Commission. In the latter year he was appointed director of the Dudley Observatory and professor of astronomy at Union College. The former position he held until the time of his death. In 1878 he was a member of the government expedition to observe the total eclipse in Colorado, and in 1882 was chief of the government expedition to observe the transit of Venus at Santiago, Chile. He was superintendent of weights and measures in New York from 1893 to 1906. During this period he was for a short time editor and manager of

the Albany Express. In 1906 he was appointed director of the department of meridian astronomy at the Carnegie Institution of Washington. He was editor of the *Astronomical Journal* in 1909. He received medals and prizes for astronomical work from several foreign scientific societies. He was the author of *Declinations of Fixed Stars* (1878); *Catalogue of 8241 Stars* (1890), and the following monographs: *The Solar System, and related papers* (1888); *Prize Essay on the Physical Nature of Comets* (1881); *179 Southern Stars* (1898); *Solar Motion and Related Researches* (1901); *Positions and Motions of 627 Standard Stars* (1903); *Preliminary General Catalogue of 6188 Stars* (1910); *Catalogue of 1059 Standard Stars* (1910). His catalogues of stars are considered standard among astronomers.

BOSTON UNIVERSITY. An institution of higher learning in Boston under the auspices of the Methodist Episcopal Church, founded in 1869. The enrollment in all the departments of the university in the autumn of 1912 was 1425. The faculty numbered 150. There were no noteworthy changes in the faculty during the year and no noteworthy benefactions were received. The amount of productive funds of the university is about \$2,500,000. There are about 40,000 volumes in the library. President, Lemuel Herbert Murlin, D. D.

BOTANY. Judged by the output of literature and the reports of meetings, the year 1912 was an active one for botanists. The American Association for the Advancement of Science met at Cleveland, O., December 30, 1912. The address of the retiring president, Dr. C. E. Bessey, of the University of Nebraska, was on "Some of the Next Steps in Botanical Science." A number of affiliated botanical societies met at the same place. The British Association for the Advancement of Science met at Dundee, Scotland, and the section devoted to botany was well attended. Ecology and hybridism in plants were the principal topics discussed. The German Association of Scientists and Physicians met at Münster and the French Association for the Advancement of Science at Nîmes in September. At the latter meeting a special programme was arranged on the subject of fungicides. The Australasian Association met at Melbourne in January, 1913.

Among the botanists who died during the past year were: Prof. Eduard Strasburger, of the University of Bonn; E. Griffin, professor of botany at the National School of Agriculture; Grignon, France; Thomas Durand, director of the Botanic Garden at Brussels; Dr. M. B. Thomas, Wabash College; Dr. W. A. Buckhout, State College, Pa.; and W. R. Smith, for many years superintendent of the National Botanic Garden, Washington, D. C.

The subject of restrictive legislation against the spread of plant diseases and other pests has received attention, and the laws of the twenty or more countries already having such provisions have been strengthened in many respects. A national quarantine against plant

diseases and insect pests was provided in an act of Congress approved August 20, 1912. Under this law the importation of potatoes from regions known to be infested with the fungus *Chrysophlyctis endobiotica* and of species of pine capable of carrying the blister blight, *Peridermium pini*, has been prohibited. Canada has extended her import regulations to prevent the entrance of the potato disease mentioned. Restrictive regulations regarding plant importations were adopted by Chile and Uruguay during 1912.

Among papers of taxonomic interest which appeared during the year were several numbers of the *North American Flora*, issued from the New York Botanic Garden; four parts of *Das Pflanzenreich*, published by Engelmann in Leipzig; and several numbers of the *Contributions from the National Herbarium*. Dr. W. Trelease published an *Account of The Black Oaks*, and Miller and Standley a *Study of the North American Species of Nymphaea*. Dr. C. E. Bessey published a revision of his *Outlines of Plant Phyla*, in which 14 phyla are recognized with 652 families of plants.

PLANT BREEDING. The activity in this line of botanical investigation has been quite marked. Dr. Hugo de Vries, in continuing his investigations on *Oenothera*, visited the type locality of *O. grandiflora* in Alabama, studying the species in its original habitat. He found several characteristic types of the species, some of which have not been described. Zeijlstra claims that *O. nanella*, one of the forms described by de Vries as a mutant, is dwarfed by reason of the presence of bacteria. When bacteria are absent the plant develops normally according to his claim. Heribert-Nilsson believes that mutants of *O. lamarckiana* described by de Vries are only the segregations of characters observed in a natural hybrid, and that the species is not an elementary one. Gates reports a series of forms of *O. biennis* parallel with those described for *O. lamarckiana*. Heckel has described a number of experiments with various species of *Solanum* from South America, and in *S. immite* within a single year a mutant resembling *S. tuberosum* was secured by the superabundant application of fertilizers. East and Hayes claim that crossing produces heterozygosis in all characters in which the parent plants differ, while inbreeding tends to result in homozygosis. Harris found from an extended study of beans that the effects produced by starvation were inherited only to a very limited extent. Pearl and Bartlett have shown that chemical characters in maize, as low protein, low oil, etc., are inherited as Mendelian unit characters.

STUDIES OF SOIL ORGANISMS. Jensen has made a study of the soil fungi in this country, and reports on the presence of 132 species and varieties isolated from soils. Miss Dale found a marked similarity in the soil fungus flora in England to that described by Jensen, many of the genera and some of the species being identical. A large number of investigations were reported on nitrogen transformation and assimilation by soil organisms with and without symbiosis with other species of plants, and the known number of organisms taking part in this important activity has been considerably increased. Other studies have been concerned with the breaking down of materials found in the soil, and Kellerman and McBeth found

that not only bacteria, but certain fungi were important agents in the destruction of cellulose. The investigations of Bottomley on *Myrica* and of Spratt on *Eleagnus* and *Alnus* have shown the polymorphism of the organism *Pseudomonas radicola*, through which nitrogen assimilation in leguminous and other plants takes place. Von Faver has described bacteria from excrescences on leaves of tropical *Rubiaceæ* which he claims assimilate nitrogen from the air. A recent investigation into the symbiosis in lichens is thought to show that under certain conditions the alga receives a portion of its carbohydrates from material secured by the fungus from its substratum.

PLANT PHYSIOLOGY. Palladin and his co-workers have continued their investigations on respiratory chromogens and found that methylene blue accelerated respiration of plants in the presence of oxygen. Stoklasa demonstrated the photochemical synthesis of carbohydrates under the influence of ultraviolet rays. Spöhr has shown a reduction of nitrates into nitrites and ammonia with the liberation of oxygen under the ultraviolet rays. Herlitzka claims that spectroscopic differences are observable in the chlorophyll in leaves and in solutions and thinks that they are present in leaves in colloidal form. Politis, from a study of anthocyanin, has concluded that this coloring material is not derived from the cell sap, but from bodies he calls "cyanoplasts." When their degeneration takes place the coloring matter becomes diffused in the cell sap. Cailliet claims that ferns and other plants accustomed to grow in damp shady places obtain a considerable portion of their carbon from their substratum. A somewhat similar claim is also made for lichens. Parkin has confirmed the observation that sucrose is the first sugar formed in the process of photosynthesis. The subject of nitrogen nutrition of plants continues to receive much attention. Puriewitsch claims that the amino acids are the best sources from which plants may obtain the nitrogen required for protein synthesis, and Loew believes that most plants can utilize nitrates in the absence of light and that transportation to the leaves is not necessary for metabolism. Hydrocyanic acid in germinating seeds of flax and sorghum has been found by Ravenna and Vecchi. Mirande has reported it in the *Calycanthaceæ*, and Petrie has found it in 29 species of Australian plants exclusive of grasses. The synthesis of fats, according to Ivanow, is brought about by the action of lipase on glycerins and fatty acids. The rôle of various substances in the plant economy has been given further study. Bernardini and Morelli claim that magnesium plays an important part in plant development through its combining with phosphorus. Weevers claims that potassium is connected with the formation of protoplasm and also with the synthesis and metabolism of proteids. Stoklasa believes that potassium is indispensable to the building up of carbohydrates as well as to other important functions of the plant. Ivanow claims that phosphates accelerate respiration in plants. Montemartini and Javillier have shown that manganese in small quantity stimulates plant activities, but Kelley found that when present in larger amounts oxidation is produced and the ability of plants to absorb phosphoric acid is lowered.

PLANT DISEASES. Considerable attention

has been turned to the injury of plants by causes other than parasites. In France an investigation was made by a commission to determine the cause of the dying of trees and other plants in parks, and it was found due to tar-laden dust arising from tarred roads. The amount of injury was in proportion to the amount of phenol in the compound used and the distance from the roads and amount of travel. The cause and control of chlorosis are still being sought. Gile found that more than 2 per cent. of calcium carbonate in the soil caused chlorosis in pineapples. Chlorosis in maize and in grapevines has been investigated in France and Italy, and a number of causes are mentioned, among them a lack of iron, sulphur, etc., and a superabundance of lime. Anderson found that the failure of apple, pear, and cherry trees to produce fruit in the neighborhood of cement works was due to the alkalinity of the dust interfering with pollination. Floyd found that certain citrus tree troubles could be produced by the use of organic fertilizers. Among the diseases due to fungi the chestnut bark disease is perhaps receiving most attention in this country at this time. First recognized in 1904, in Brooklyn, N. Y., it has spread along the eastern seaboard, and it is now known to be present in at least ten States. In Pennsylvania a commission has been created to study and combat it, an appropriation of \$275,000 having been made for that purpose. Congress has granted \$80,000 to the U. S. Department of Agriculture to investigate its cause and means for control. The fungus was named *Diaporthe parasitica*, but it appears to differ from a harmless saprophyte common in Europe mainly in its parasitic habit. During the past summer a saprophytic form of the fungus was found in this country. It is claimed that no morphological differences are apparent between the two forms. The black canker or ink disease of chestnut trees in southern Europe, so called from the characteristic exudation accompanying it, is quite distinct from the trouble in this country.

The white-pine blister blight continues to demand attention, and it has been conclusively shown that a single inspection of pine seedlings will not determine the presence of the fungus. The importation into this country of all pine seedlings belonging to the group of white pines has been prohibited. In England and elsewhere in Europe the black wart disease of potatoes (*Chrysophlyctis endobiotica*) continues to be destructive. Its known range now includes much of England, parts of Scotland and Wales, and Germany and Austria, as well as Newfoundland, Miquelon, and probably Nova Scotia. In Germany the most serious disease of the potato is the leaf roll, a trouble of uncertain origin, and a commission has been appointed to study it. Wollenweber, Appel, and others are studying the relation of *Fusarium* to this and other potato diseases. Jones and others have reported on the life history of the fungus *Phytophthora parasitica*, the cause of the late rot of the potato. A new dry rot of the potato, due to *Fusarium trichothecoides*, has been described within the year. An investigation by Schuster in Germany has shown about a half dozen species of bacteria capable of producing potato diseases. The subject of rusts of grains and other plants continues to be investigated, and Arthur, Kern, Clinton, Hecke, Dietel,

THE CONTROL OF PLANT DISEASES. Extensive experiments are in progress in this country and elsewhere to find some fungicides superior to Bordeaux mixture. For many diseases, especially those affecting fruit trees, a lime-sulphur mixture is proving very valuable, as it is not only a fungicide, but destroys insects at the same time. For some diseases, however, its use can not be recommended. For these Bordeaux mixture should be used even if some injury follows its corrosive action. In England and Italy very dilute mixtures of Bordeaux mixture have been found efficient in controlling plant diseases and they are without some of the objectionable features of the stronger mixture. Vermorel and Dantony have shown that the wetting power, and hence the efficiency, of fungicides depend upon the surface tension of the film deposited on the leaf and that the addition of a small quantity of gelatin to the mixture increases its covering power to a remarkable degree. In France combined treatments with liquid sprays and powdered sulphur have been very successfully used for the prevention of the downy and powdery mildews of grapes. The value of spraying potatoes with Bordeaux mixture when little or no disease is present has been shown at the Vermont Agricultural Experiment Station, where in 20 years' experiments gains were made of 18 per cent. when no disease was noticeable and 215 per cent. when diseases were severe. The average gain was 205 bushels per acre. Stewart and French have found that neither lime-sulphur compound nor lead benzoate could be substituted for Bordeaux mixture in spraying po-

BOWDOIN COLLEGE. An institution of higher education at Brunswick, Me., founded in 1794. The students in all departments of the college in the autumn of 1912 numbered 393 and the faculty numbered 82, including the faculty of the medical school. During the year the changes in the faculty included the addition of an instructor in music, one in biology, and one in the department of economics. A new building for the gymnasium, funds for which were raised by subscription from the alumni and others, approached completion at the beginning of the collegiate year. The productive funds of the college amounted to \$2,149,485 and the income in 1911-12 to \$127,839. There were 103,035 volumes in the library.

President, William De Witt Hyde, D. D., S. T. D.

BOWLING. The twelfth annual tournament of the American Bowling Congress was held at Chicago in March. The individual championship was won by L. Sutton, of Rochester, N. Y. (679). M. Hotchkiss, of Detroit (674), finished second, and W. Elivert, of Toledo (664), third. The two-men team contest was won by the Owen-Sutton combination, with a score of 1259. In the five-men team event the Brunswick All-Stars of New York were the victors, with a total of 2904 pins.

The sixth annual tournament of the National Bowling Association was held at Paterson, N. J., in March. The winners and scores were: Individual, Leo Lucke, Brooklyn (699); two-men team, Lindsey-Johnson, New Haven (1301); five-men team, Grand Centrals, Rochester (2997). The five-men score breaks the record of 2969 pins made by the Bonds of Cleveland in 1911. Other new records of the year were made by Louis Violetich, of Kansas, whose high individual score at the A. B. C. tournament was 280, and by James Smith, of Buffalo, who rolled up a total of 771 for three games in the Canadian tournament held at Toronto. Smith also averaged 228 8-9 for nine games at the same tournament.

BOWYER, JOHN MARSHALL. A rear-admiral, retired of the United States navy, died March 15, 1912. He was born in Cass county, Ind., in 1853 and graduated from the United States Naval Academy in 1874. He rose through various grades, becoming lieutenant-colonel in 1899, commander in 1903 and captain in 1907. At the outbreak of the Spanish-American War he was appointed executive officer of the *Princeton* and with this vessel did patrol duty about the western end of Cuba. He took part in the suppression of the Philippine insurrection and in the Boxer outbreak in North China. From 1901 to 1905 he acted as assistant superintendent of a gun factory in the Navy Yard at Washington and as head of the Department of Yards and Docks. In 1905 he commanded the U. S. S. *Columbia*. He was the senior officer in command of the *Columbia* at Colon and the *Marblehead* at Panama in 1906 at the time of the troubles attendant upon the separation of Panama from Colombia. In 1907 he commanded the battleship *Illinois* and made the cruise to the Pacific and around the world with the Atlantic fleet. From 1909 to 1911 he was superintendent of the United States Naval Academy. He received medals for service in various campaigns. He was made rear-admiral in 1911 and retired in the same year.

BOXING. The year 1912 was a record year in boxing in the fact that eight champions were defeated. One of those to relinquish his laurels was "Abe" Attell, who for twelve years had held the featherweight championship. He was defeated by Johnny Kilbane, of Cleveland, in a 20-round battle at Los Angeles. Another champion to bow to Father Time was Ad Wolgast, of Michigan, who had won the lightweight title from "Battling" Nelson. Wolgast was beaten by Willie Ritchie, of San Francisco, in 16 rounds on a foul. Besides the Americans who lost their titles six foreign champions went down to defeat. They were "Jim" Sullivan, middleweight champion of England, who was knocked out by Billy Papke, of the United States; Jack Harrison, middleweight champion of Great

Britain, who was knocked out by Eddie McGoorty, of the United States; Dave Smith, middleweight champion of Australia, who also was knocked out by Eddie McGoorty, of the United States; Georges Carpentier, middleweight champion of France, who was defeated by both Billy Papke and Frank Klaus, of the United States; "Digger" Stanley, bantamweight champion of Great Britain, who was knocked out by Charles Ledoux, of France; Matt Wells, lightweight champion of Great Britain, who was defeated by Freddie Welsh, a former holder of the title. The men who defeated Smith, Carpentier, Harrison, and Stanley were non-residents and the titles therefore did not change hands. Sullivan retired from the ring.

The following is a list of the present world's champions: Heavyweight, Jack Johnson; lightweight, Willie Ritchie; featherweight, Johnny Kilbane, and bantamweight, Johnny Coulon. The middleweight and welterweight titles are open.

Two new classes were added in 1912 by the State Commission of New York and a change also was made in the division of weights. The additional classes are the paperweight for boys of 108 pounds or under, and the commission weight for men over 158 pounds and under 175 pounds.

During the year 46 clubs received licenses in New York State and the provision that each shall pay a tax of 5 per cent. of the gross receipts netted the State nearly \$60,000. Boxing inspectors also were appointed for each club to see to it that the commission's rules were enforced.

The boxing championships of the Amateur Athletic Union were held at Boston on April 9. The results of the final bouts were: 105-pound class, James Lynch, of Cambridge, defeated Patsy Green, of Cambridge; 115-pound class, Tommy Reagan, of East Boston, defeated George Pritchard, of Forest Hill; 125-pound class, John Cooper, of Chelsea, defeated Edward Desmond, of Boston; 135-pound class, Al Wambags, of New Orleans, defeated Mike Sullivan, of East Boston; 145-pound class, Charles Askins, of Boston, defeated W. P. Widdicombe, of Fort McKinley, Me.; 158-pound class, A. Sheridan, of New York, defeated B. A. Lavalie, of Somerville; heavy-weight class, John Silveria, of Beverly, defeated Thomas Kelly, of Roxbury.

The winners at the English Amateur Boxing championships were: Bantamweight, W. W. Allen, the titleholder; featherweight, G. R. Baker; lightweight, R. Marriott; middleweight, E. V. Chandler; heavyweight, R. Smith.

BOYCOTT. DANBURY HATTERS' CASE. This case grew out of a strike in 1902 by the union hatters in the employ of Loewe and Company in Danbury, Conn. The purpose was to maintain a closed shop. The American Federation of Labor assisted the United Hatters of North America and the American Anti-Boycott Association carried on the fight in behalf of the employers. In 1908 the United States Supreme Court declared the boycott illegal under the anti-trust law, and ordered the company to sue for damages. In 1910 a jury in the United States Circuit Court of Connecticut placed the damages at \$74,000, which sum would be trebled under the provisions of the Sherman act. This fine was levied upon the individual

members of the union. Upon appeal to the United States Circuit Court of Appeals a decision was secured in 1911 declaring this manner of levying the fine unwarranted. The case was then retried in the United States District Court at Hartford, where a jury rendered a verdict in 1912 awarding \$80,000 damages to Loewe and Company. Steps were then taken by the defense to appeal the case once more.

On the basis of this decision various suits have been begun against trade unions. Late in 1912 suit was begun against the United Mine Workers for damages of \$750,000. None of these suits have been terminated. The American Federation of Labor has been most outspoken in its opposition to the interpretation of the Sherman act, which renders trade unions illegal, and especially to that portion of these boycott decisions which has made unions liable for damages.

BOY SCOUTS. See AGRICULTURE.

BOY SCOUTS OF AMERICA. An organization founded in 1908 for the general purpose of training boys between the ages of 12 and 18 in self-reliance, manhood, and good citizenship. A member of the organization is pledged "to do his duty to God and his country and to obey the scout law; to help other people at all times; to keep himself physically strong, mentally awake, and morally straight." The movement has had an extraordinary success since its beginning. At the head of each band of scouts is the scout-master, who must be a person of influence and possess qualities which boys respect. He has general charge of the organization and training of boy scouts. During 1912, 4520 new scout-masters were commissioned, making a total of over 6000 men who have voluntarily given their services as scout-masters and assistants. An interesting tabulation of the occupation of scout-masters is furnished in the second annual report of the organization for 1912. It shows that out of a total of 1500 there were 463 clergymen, 150 clerks, 110 teachers, 76 students, 74 superintendents of schools. Others included lawyers, mechanics, and managers. Out of the 1500, 956 were college graduates. In nationality, 1232 were American, 104 English, and 124 foreigners of other nationalities. Badges are awarded to the boy scouts for excellence in service.

The most important event of the year 1911-12 was the visit of Lieutenant-General Sir Robert Baden-Powell to the United States. General Baden-Powell was the originator of the boy scout movement in England. He visited twenty of the most important scout centres of the United States and delivered lectures on the movement. During his visit the annual meeting of the national organization was held in New York City. In the summer of 1912 important summer schools for scout-masters were conducted in different parts of the country. The officers of the Boy Scouts of America in 1912 were as follows: Honorary president, Hon. William H. Taft; honorary vice-president, Col. Theodore Roosevelt; president, Colin H. Livingstone, Washington, D. C.; chief scout, Ernest Thompson Seton; national scout commissioners, Daniel Carter Beard, Adjutant-General William Verbeck, of New York, and Col. Peter S. Bonus, of New York.

BRADLEY, JOHN EDWIN. An American educator, died October 7, 1912. He was born in Lee, Mass., in 1839 and graduated from Wil-

liams College in 1865. For three years following he was principal of the high school in Pittsfield, Mass. From 1868 to 1886 he was principal of the high school in Albany, N. Y. In the latter year he became superintendent of the city schools of Minneapolis, holding this position until 1892, when he was elected president of Illinois College. He retained this office until 1900. He was a member of several educational associations and was a member of the National Congregational Council for several years, and of the International Congregational Council in 1899 and 1908. In 1900 he was vice-president of the Ecumenical International Council, New York. He was the author of *Science and Industry*; *School Incentives*; *Healthfulness of Intellectual Pursuits*; *Unconscious Education*; *Work and Play*, and *Talks with Students*.

BRAGG, EDWARD STUYVESANT. An American soldier and public official, died June 20, 1912. He was born in Unadilla, N. Y., in 1827. He studied for three years at Geneva (now Hobart College) and then began the study of law. He was admitted to the bar in 1848 and soon after removed to Fond du Lac, Wis. From 1854 to 1856 he was district attorney of Fond du Lac county. He was delegate to the Charleston Convention in 1860. He supported Stephen A. Douglas for the presidency. At the outbreak of the Civil War he entered the Union army as captain of the 6th Wisconsin Infantry. He served with distinction throughout the war, rising to the rank of brigadier-general. He participated in nearly all the campaigns of the Army of the Potomac. After the war he returned to Fond du Lac, where in 1866 he was postmaster. In the following year he was elected State senator. In 1866 and 1868 he was delegate to the National Convention and was again a delegate to the Democratic National Convention in 1872. He was elected to Congress in 1877 and served until 1883. In the following year as chairman of the Democratic National Convention he seconded the nomination of Grover Cleveland. In this speech he used the phrase which afterwards became famous in reference to Cleveland, "We love him for the enemies he has made." In 1885 he was elected to Congress for one term. He was appointed minister to Mexico in 1888. He was prominently mentioned as a presidential candidate by the delegates to the Indianapolis Convention of the Gold Democrats in 1896. In 1900 he supported McKinley. He was appointed consul-general at Havana in 1902 by President Roosevelt. In a letter to his wife, written from Havana, he said that "Uncle Sam might as well try to make a whistle out of a pig's tail as to try to make something out of the Latin race." This letter was published and caused much irritation in Cuba, and General Bragg was transferred to the consul-generalship at Hongkong. Here he remained until 1906 when he retired in consequence of ill health. Shortly afterwards a pension of \$50 a month was given him by Congress. General Bragg was, in his time, one of the most efficient debaters in public life.

BRASTOW, LEWIS ORSMOND. An American theologian and educator, died August 10, 1912. He was born in Brewer, Me., in 1834, and graduated from Bowdoin College in 1857. He studied theology at the Bangor Theological Seminary and was ordained to the Congregational ministry in 1861. He acted as chaplain of the 12th regiment of Vermont Volunteer Infantry in

the Civil War, and also as pastor in the St. Johnsbury, Vermont, Congregational Church from 1861 to 1873. He was pastor at Burlington, Vt., from 1873 to 1884. In 1885 he was appointed professor of practical theology at the Yale Divinity School, holding this chair until 1907. He was the author of *Representative Modern Preachers* (1904), and *The Modern Pulpit* (1906). He also contributed articles on theological subjects to magazines and newspapers.

BRAZIL, UNITED STATES OF. A South American republic. Capital, Rio de Janeiro.

AREA AND POPULATION. The area is not known with accuracy but is estimated at 8,550,000 square kilometers (3,301,155 square miles). Still more uncertain is the number of inhabitants. The censuses of 1890 and 1900 disclosed 14,333,915 and 17,318,556, respectively. The estimate of December 31, 1908, placed the population at 20,515,000; this figure includes the inhabitants (about 70,000) of the Acre territory, acquired from Bolivia in 1902. No census was taken in 1910 on account of lack of funds. An unofficial estimate in 1912 was 24,000,000. Recent estimates of municipal populations (necessarily not very accurate): Rio de Janeiro, 1,000,000 (probably too high); São Paulo, 400,000; Bahia, 350,000; Recife (Pernambuco), 113,000; Belem do Pará, 100,000; Porto Alegre, 100,000; Manaus, 80,000; Fortaleza (Ceará), 50,000; Curitiba, 60,000; Niterói, 50,000; Santos, 50,000.

Immigration in 1910, 88,564; in 1911, 135,967 (Rio de Janeiro, 72,970; Santos, 53,067). Of the total in 1911, 47,493 were Portuguese, 27,141 Spaniards, 22,914 Italians, 14,013 Russians, 6319 Turks, and 4251 Germans. The total number of immigrants recorded from 1820 to 1911 was 2,967,153; of these, 1,277,785 were Italians, 781,140 Portuguese, 367,221 Spaniards, 109,572 Germans, and 82,512 Russians.

EDUCATION. In Brazil, as in most of Latin America, the greater part of the population is illiterate. But in recent years primary instruction has made considerable progress. In 1910 there were 12,221 primary schools, with 634,539 pupils (352,418 boys, 282,121 girls). Of the schools, 2695 were private, 2608 municipal, and 6918 government. Secondary schools in 1909 numbered 327, with 30,258 pupils. Various institutions offer some opportunity for technical and professional instruction.

PRODUCTION. Agriculture is the principal source of wealth, but vast areas of the country are unsettled and even unexplored. The principal crop is coffee, grown chiefly in the state of São Paulo, but also in Espírito Santo, Minas Geraes, and Rio de Janeiro. The price of coffee is maintained by the imposition of an additional tax on exports over a certain amount, by the encouragement of consumption abroad, and, in São Paulo, by the prohibition of further extension of coffee plantations. The great cacao crop is produced almost entirely in the state of Bahia, which also leads in tobacco. Other important crops are sugar, produced especially in Pernambuco, cotton, rice, corn, yerba maté, and bananas. Rubber, gathered in the Amazon valley, ranks next to coffee in export value. Cattle-raising is carried on extensively in Matto Grosso, Minas Geraes, Rio de Janeiro, and São Paulo. There is some production of gold, manganese,

monazite sand, and gems, but the country's mineral resources are little developed. The leading manufacture is cotton fabrics.

COMMERCE. Imports and exports of merchandise were valued at \$235,574,837 and \$310,006,438 in 1910, against \$179,690,125 and \$308,331,829 in 1909. The leading imports include iron and steel manufactures, machinery, railway materials, cotton goods, flour, coal, wine, arms and ammunition, codfish, kerosene, jerked beef, and paper. In 1910 the principal exports included: Coffee, 9,723,738 bags of 60 kilos, valued at \$127,212,875 (against 16,850,696 bags, \$161,922,682, in 1909); rubber, 38,547 metric tons, \$124,400,714 (39,207 tons, \$91,578,388, in 1909); yerba maté, 59,360 tons, \$9,575,550; hides, 34,059 tons, \$8,626,966; tobacco, 34,149 tons, \$8,048,925; cacao, 29,158 tons, \$6,824,139; sugar, 58,824 tons; cotton, 11,160 tons; skins, 2696 tons. In 1910 the United Kingdom supplied imports and received exports valued at \$67,061,000 and \$73,441,000, respectively; Germany, \$37,456,000 and \$36,286,000; United States, \$30,254,000 and \$112,184,000; France, \$22,268,000 and \$26,117,000; Argentina, \$20,133,000 and \$11,618,000; Portugal, \$13,104,000 and \$834,000; Belgium, \$10,655,000 and \$5,612,000.

SHIPPING. Foreign entrances, 1909: 5016 vessels, of 12,422,515 tons (6,239,330 British); 1910: 5509, of 13,591,515 tons. Brazilian entrances in 1910: 16,834 vessels, of 7,813,659 tons. In 1911 the merchant marine consisted of 238 steamers, of 130,582 tons net, and 290 sailing vessels, of 60,728 tons net.

COMMUNICATIONS. According to the president's message, as reported in 1912 by the Pan-American Union, Brazil had, at the end of 1911, 22,128 kilometers (13,750 miles) of railway, as compared with 21,370 kilometers (13,279 miles) at the end of 1910. Among the important extensions in 1911 was one from Pirapora to Belem, connecting the latter city with Rio de Janeiro, distant by rail 3650 kilometers (2268 miles). Railways reported under construction at the beginning of 1911 aggregated about 3750 kilometers (2330 miles). The practical completion was to be recorded of the Madeira Mamore line, built to connect the navigation of the Amazon, where it is interrupted by rapids. A contract was let during the year to a German syndicate for the Santa Katarina Railway, while the Brazilian North-Eastern Railways, operated on a meter gauge, had under construction 186 miles of line. The railway line connecting the towns of Araguara and Pio-Preto in the state of São Paulo, a distance of 143 miles, was opened early in July, 1912. The Southern São Paulo, running from Santos to Santa Juquia, had 100 miles of line under construction. Telegraphs in 1909: Lines, 36,199 miles; wire, 73,124 miles; offices, 2070; post offices, 3246.

FINANCE. The gold milreis is valued at 54.6 cents; the paper milreis fluctuates between 31.5 and 33.5 cents. The 1911 budget showed estimated revenue of 85,048,526 milreis gold and 299,908,400 milreis paper; estimated expenditure, 69,100,356 gold and 394,186,258 paper. The 1912 budget: Estimated revenue, 91,790,776 milreis gold and 318,350,000 paper; estimated expenditure, 56,868,562 gold and 382,924,976 paper. The budget submitted to the congress for 1913 showed estimated revenue of 125,792,000 milreis gold and 345,243,000

paper; estimated expenditure, 80,861,000 gold and 431,374,000 paper. Public debt, December 31, 1911: Foreign, £82,903,120 and 300,000,000 francs; internal, 620,525,600 milreis paper; floating, 256,546,647 milreis paper; paper money in circulation, 612,519,626 milreis. A presidential decree of April 24, 1912, authorized a bond issue up to approximately \$35,000,000.

NAVY. In 1912 the Brazilian navy included: Two dreadnoughts (*Minas Geraes* and *São Paulo*), aggregating 38,500 tons; one old battleship (*Riachuelo*), 5700; two armored coast guards (*Deodoro* and *Floriano*), 6320; two monitors, 940; two scout cruisers (*Rio Grande* and *Bahia*), 6200; one protected cruiser (*Barroso*) 3450; two second-class cruisers, 5840; three torpedo cruisers, 3090; one old gunboat, 800; one old destroyer, 500; ten modern destroyers, 6500; two schoolships, 4000. In addition, there were several old torpedo boats, river gunboats, transports, and dispatch boats. Brazil's third dreadnought, the *Rio de Janeiro*, 27,500 tons, which was begun in February, 1910, at Elswick, was not completed in 1912. Owing to changes in design, there has been considerable delay in her construction. Three armored gunboats for river patrol duty were ordered in January, 1912.

ARMY. The reorganization of the Brazilian army under the law of 1908 was completed in 1912 and a peace strength of about 28,000 men was secured, which it was proposed to increase to 30,000. Service is compulsory from the ages of 21 to 44—two years with the colors, seven in the reserve, seven in the second line, four in the national guard, and four in its reserve. The organization of the permanent army consisted of 15 regiments of infantry, each of 3 battalions; 12 regiments of light infantry, 15 machine-gun companies, 9 regiments of cavalry and 3 independent regiments, 10 squadrons for infantry brigades, scouting troops for the cavalry, 45 4-gun batteries, 5 8-gun howitzer batteries, 9 4-gun horse batteries, 6 4-gun mountain batteries, siege artillery, 15 ammunition columns, and engineering and transport troops. The republic is divided into 13 military inspection districts, in 4 of which "strategic brigades" were organized.

GOVERNMENT. The president is elected for four years by direct vote and is not eligible for the succeeding term. He is assisted by a cabinet of seven ministers appointed by and responsible to himself. The congress consists of two houses, the Senate and the Chamber of Deputies. Senators, numbering 63, are elected by direct vote for nine years, three for each state and the federal district. The deputies, 212 in number, are elected for three years. The president in 1912 was Marshal Hermes da Fonseca, who was elected March 2 and inaugurated November 15, 1910.

HISTORY. There were election disturbances in the state of Bahia in January which required the calling out of the federal troops to restore order. Threatened disorders in the state of Para led also to government intervention in October. The death of Baron Rio Branco (q. v.), Brazil's most famous minister for foreign affairs, through whose efforts the territories of the republic had been greatly increased, withdrew an influential figure from South American politics. He was succeeded as foreign minister by Dr. Lauro Miller. A treaty of commerce and navigation was con-

cluded with Bolivia. A fish commission to protect the Brazilian whale industry was created in July. Legislation for improving the condition of the Brazilian Indians was enacted. For the question with the United States in connection with the Brazilian coffee valorization syndicate, see **COFFEE VALORIZATION**, and **UNITED STATES, Foreign Affairs**. See also **IRRIGATION**.

BREAD. See **FOOD AND NUTRITION**.

BREEDING. See **STOCK-RAISING**, and **BIOLOGY**.

BRETHREN, CHURCH OF THE (also known as **Dunkers** or **Dunkards**). A religious denomination which had its origin in Germany in 1708. It includes a considerable body of Christians in the United States. Bodies of worshippers settled first near Germantown, Pa., whence they spread to various sections of the country. The faith and practice of the denomination are not generally known outside of the communities in which they live. There are three groups, the Conservatives, Progressives, and Old Order. The first are the most numerous, numbering about 95,000 communicants, 3066 ministers and 938 organized churches in the United States, and about 20 in foreign countries. This body maintains ten colleges and one of the largest denominational printing houses in the West at Elgin, Ill. During the year this body found it necessary to close the work hitherto carried on in France and Switzerland, but arrangements were made to add to the forces in Denmark and Sweden. Four new missionaries were added to the workers in India. Missions are carried on in China, and these were greatly hindered in 1912 by the revolution in that country. An orphanage was opened during the year in China and a girls' school will be opened soon. The denomination maintains about 50 missionaries in foreign countries. The national conference of the denomination was held in York, Pa., in the early part of June. The conference for 1913 will be held at Winona Lake, Indiana, in June. The Progressive Brethren in 1912 numbered about 20,000 communicants, with 220 churches and 185 ministers. They maintain a college and publishing house at Ashland, Ohio. The Old Order numbers about 4000 communicants, 75 churches and 225 ministers. A small body known as the Seventh Day German Baptists numbers about 240 communicants, 14 churches and 9 ministers. It is found in the vicinity of Ephrata, Pa.

BREWING INDUSTRY. See **EMPLOYERS' LIABILITY**.

BRIDGES. There were no extraordinary developments in bridge construction during the year 1912. A large number of works which embodied few if any new features of engineering design were in course of construction. As was to be expected, reinforced concrete in one form or another was gaining in use, and this material figured in a larger proportion of the smaller bridges as well as some of notable size. In the United States, excepting a few large railway bridges and the completion of the St. Louis bridge, little out of the ordinary run of construction and erection was to be noted. A bridge across the Hudson River from Manhattan Island to the New Jersey shore continued under discussion during the year, and meetings were held by commissioners looking towards the evolution of a plan for such a structure. The great growth of automobile traffic between New York City and New Jersey, both pleasure and commercial, stimulated this discussion, as such

traffic could not be handled by any tunnel or tunnels, which if railway transportation alone was concerned, would be far more economical and feasible. The National government has always regarded very zealously the channel of the Hudson River, and the location of piers in this stream would be such as to require a great width of span. The height of an appropriate structure would also involve considerable expense on the New York side on account of the cost of approaches, but various locations in the upper part of New York City were proposed where this concern would not be insurmountable. During the year progress was made on the great Hell Gate bridge, connecting Long Island with the mainland of New York, and this structure promised to be an important addition to the notable group of bridges around New York City. In Canada progress was being made with the piers for the new Quebec bridge, and the adopted designs of the structure continued to be discussed.

ST. LOUIS MUNICIPAL BRIDGE. The municipal or free bridge, the fourth to be built across the Mississippi River at St. Louis, was reaching completion at the end of 1912, including the approaches on the west side of the river, which involved a viaduct for both railway and highway. This involved a steel superstructure of the plate girder type, with a maximum grade on the highway of 3.443 per cent. and on the railway of 1.385 per cent. This approach was built through the city by cutting a right-of-way 100 feet in width through the settled portion, with extra space for a station building, between 4th Street and Broadway. The total length of the approach is about half a mile, and the estimated cost for foundations, superstructure, right-of-way, etc., was about a million and a quarter dollars.

GALVESTON CAUSEWAY. During the year there was completed the earth, steel, and concrete structure crossing the two-mile stretch on Galveston Bay and connecting the island on which the city is built to the mainland of Texas. This work has been in course of construction since 1909, and represents the final work in the campaign which was designed to render the city independent of the storms and tidal waves from the Gulf of Mexico, that had caused such great damage to the city in years past. The causeway, 12,642 feet in length, carries the tracks for the railway lines entering the city and a driveway on which trolley cars are operated, in addition to accommodations for vehicles and pedestrians. The causeway proper amounts to 10,170 feet, protected by concrete piling and concrete slabs, and the two sections of this are united by an arch bridge construction, 100 feet of which is taken up by a roller-lift bridge. This bridge, which is carried on a massive concrete pivot pier 78 x 553 feet in plan, weighs 3,283,000 pounds, of which 1,400,000 is steel and the remainder is 300 cubic yards of concrete which is used as a counterbalance. The bridge is balanced so perfectly that it is operated by a 50 horsepower electric motor, two of which, along with a 50 horsepower gasoline engine with dynamo and storage batteries, are located in a concrete power house on the west side of the causeway. The arched bridge portion of the causeway consists of 28 concrete arches, each with a 70-foot span and 9-foot elevation, supported on reinforced concrete piers founded on 30-foot piles driven into the clay bed of the river. The double-track railway on top of the causeway is laid with 90-pound rails and

equipped with an elaborate and modern block signal system. The cost of the entire project was estimated at about \$2,000,000.

CANADA. The most striking bridge construction of the year was possibly to be found in Canada, where progress was being made on the foundations for the great Quebec bridge, but there were also a high level bridge at Edmonton across the Saskatchewan River and a bridge for the Grand Trunk Railway across the Pembina River which had one 240-foot span and two 220-foot spans, besides approaches. Bridges built with steel piers and girders across the McCleod River, 1060 feet in length and 118 feet high; across the Battle River, 2272 feet in length and 184 feet high, and the Clover Bar Bridge, 1665 feet in length and 137 feet high, were all in course of construction.

GREAT BRITAIN. Bridge construction in the United Kingdom during 1912 was limited, and aside from a few lift bridges, as that over the Trent River and two for Dublin, most of the work was of ferro-concrete construction, a bridge at Waterford being the largest structure of reinforced concrete in the United Kingdom. It had 12 spans 45 feet each, with a lifting span of 90 feet, and was 48 feet in width. This bridge, as well as reinforced structures for the Stour near Ballingdon and the Wallsend bridge, were reaching completion at the end of 1912.

A large suspension bridge with a principal span of 414 feet was built in novel form over the Danube at Passau. On one side of the river chains were anchored directly to the cliff, while on the opposite bank the usual form of tower was built.

MERSEY SUSPENSION BRIDGE. A suspension bridge of 2700 feet span over the Mersey River at Liverpool, England, was one of the propositions made during the year. This bridge was designed to accommodate automobile and street car traffic and would be 2700 feet in length on the main span, towers 506 feet high (200 feet in height above high-water mark), depth of girders 50 feet, weight of girders 2100 tons, width between girders 50 feet, width between towers 300 feet, and weight of cables (410 square inches in each) 6400 tons. The total cost was estimated by L. H. Chase, who was responsible for the proposition, at not to exceed \$4,000,000, exclusive of the land and legal expenses. A novel feature of the design was to employ a spiral incline instead of long approaches on each shore. This spiral was to have an external diameter of 300 feet and an internal diameter of 200 feet, with a building occupying the space inside the helix.

CONSTANTINOPLE PONTOON BRIDGE. During 1912 a new pontoon bridge at Constantinople, crossing the Golden Horn and connecting Galata with Stamboul, was opened. This structure takes the place of a former floating bridge built forty years previously across the Golden Horn, which at this point is 1542 feet in width. The particular form of construction was dictated by motives of economy in which the length of span, depth of water, nature of the bottom and necessity for providing for steamships of large draught in the vicinity figured. Work was begun in 1910 and abutments were built on either shore 1530 feet apart. The pontoons are arranged in two rows parallel to the longitudinal axis of the bridge, and the roadway is a continuous structure built upon them 82 feet in width between the railings with two footways of 18 feet and a central driveway 46 feet

in width. There are two clear openings 39 feet in width with a clear headway of 17 1-2 feet, while, when the middle opening span is swung clear, a passage of 205 feet is given for vessels. This middle span is swung around through 180°, propellers driven by electric machinery being the motive power.

CHINESE BRIDGES. A cantilever bridge that had been three years in course of construction across the Yellow River near Tsinanfu on the line of the Tientsin-Pukow River in China was completed during 1912 by the Maschinen-fabrik Augsburg-Nürnberg, of Germany. This bridge is a cantilever structure 4100 feet in length, composed of nine spans of 300 feet each and a three-span cantilever structure comprising anchor arms of 420 feet and a cantilever span of 540 feet. Eight of the bridge spans are on the north bank and one on the south bank of the river. The bridge is designed to carry ultimately two standard railway tracks, but one track was laid at the time of its construction and the trusses were proportioned for that weight, it being the intention to provide duplicate trusses outside of the original parts when the strength incidental to the double tracking was required. False-work was used in the construction of the approach and anchor spans, but the channel spans required cantilever erection on account of the soft bottom and changing conditions of the river, which varies greatly in flood times. This also involved difficulties in constructing the piers which are of concrete with stone facing founded on reinforced-concrete piles driven in open cylinders or cofferdams, except in the case of the river piers. The river at low-water width is about 1300 feet across, but at times of flood it spreads out over a vast area embraced between high-water dikes. The superstructure is made up of trusses of the subdivided Warren type with parallel cords, except that the top cord of the cantilever is up-curved towards the main piers to get extra depth. On the cantilever span the roadway is level with the rail-level in mid-channel 144 feet above low-water. The trusses are spaced 31 feet apart. Each cantilever arm is one-sixth of the span length and the suspended span is two-thirds the cantilever span length, or 360 feet, the closure of the suspended span being made on October 9, and the bridge opened on December 1. The cost of the bridge was stated at between \$2,400,000 and \$2,850,000.

Another Chinese bridge of importance was that on the Antung-Mukden Railway, across the River Yalu, with six 300-foot spans, one of which opened, was also under construction during the year, at an estimated cost of \$1,200,000.

INDIA. Important bridge building was reported from India during the year, where progress was being made on the foundation of the Sara Ghat bridge across the Lower Ganges. The structure consists of 15 bow string girders 350 feet long and 52 feet deep. At Allahabad the Bengal and North-Western Railway was building a bridge with 40 spans of 150 feet. It had made considerable progress during the year, while the Jumna bridge on the East Indian Railway at the same place, which has 14 through spans of 213 feet 9 inches, was being widened. A double-leaf rolling lift bridge of 225 feet span was being built over the Pambam channel.

AFRICA. In Africa several important bridges were under construction in Egypt, while in Nigeria an important bridge at Jebba on the Lagos Railway, was under construction, the northern channel crossing being already completed, while a 7-span structure was being built across the southern channel. A notable masonry bridge 1466 feet in length and consisting of 27 arches was building at Constantine in Algeria during the year. The arches making up this bridge are from 28 to 98 feet in span, with one of 230 feet, and the bridge itself forms a half-circle. It was being built with two masonry ribs with girders across them and a ferro-concrete slab floor. A steel arch of 525 feet span over the Sauanga River was also under construction.

BRINKLEY, FRANK. An English editor, died October 28, 1912. He was born in 1844. He removed to Japan and in 1867 commanded the Royal Artillery. He was principal instructor at the Marine Artillery College at Tokyo in 1871, and later was appointed professor of mathematics at the Imperial Engineering College, Tokyo. In 1881 he became editor and proprietor of the *Japan Daily Mail*. He was adviser to the Japanese government and was Japanese correspondent of the *London Times*. In recognition of his service to the government, the Japanese Order of Sacred Treasure was conferred upon him. Among his published writings are, *Japan* (1901), and *Japan and China* (1903). He also compiled an unabridged Japanese-English Dictionary. He wrote the article on "Japan" for the *Encyclopædia Britannica*.

BRISSON, HENRI. A French statesman and writer, died April 14, 1912. He was born in Bourges in 1835. After studying law in Paris he was called to the bar in 1859. His most important work in his earlier days, however, was in journalism. He was one of the famous group of Liberal and Republican writers which included Jules Ferry, Charles Floquet, and Louis Blanc. These writers became famous for their attacks on the Empire in the columns of *Le Temps*. In 1868 Brisson founded *La Revue Politique*, but this was soon suppressed by the military authorities. In 1869 he made his first attempt to enter politics as a candidate for a Paris division but he was defeated. He was elected in 1871 one of the deputies for Paris to the National Assembly. He became identified with the extreme Left. He took a notable part in the proceedings of the Assembly and at the beginning of the session of 1881 was elected president of the Chamber of Deputies. To this position he was reelected nineteen times during the next thirty-two years, although there were intervals when others occupied the chair. In 1885 he was appointed prime minister and minister of justice. He at once found himself in complications as the result of a coalition of the Right and the extreme Left over the votes for the occupation of Tongking and for the execution of the treaty of Tien-tsin. The ministry, having refused to accept the decision of a special commission which advised the abandonment of all territories occupied by France or under French protection in China, found its majority reduced to two or three votes. The position of Brisson was further compromised by the fact that he was a candidate for the presidency to succeed Grévy. Grévy was reelected for a second term, Brisson receiving only 68 votes. He with his

cabinet then resigned. It is said one of his greatest ambitions was to become president of France and that he did not abandon this ambition up to the time of his death. In the elections of 1889 he defeated the Boulangist candidate and was throughout the whole Boulangist episode one of the strongest adversaries of that movement. As one of the members of the Assembly he was one of the first to initiate the political campaign against the religious orders and constantly took a prominent part in the debates in the Chamber. In 1893 he presided over the Panama Inquiry Commission. From 1894 to 1898 he was president of the Chamber. In 1898 he was again appointed prime minister. France was then in the midst of the throes resulting from the Dreyfus affair. Among the members of Brisson's cabinet were Delcassé, Bourgeois, Cavaignac, and Lockroy. On July 7, Cavaignac, as minister of war, delivered the famous speech which conveyed the impression that the Dreyfus affair was finally closed. It soon appeared, however, that the authenticity of the documents upon which this information was based was questioned, and on July 9, General Picquart addressed his celebrated letter to Brisson denouncing the documentary evidence as false. The events which followed led to the fall of the ministry. From that period until the time of his death M. Brisson was chiefly known as a Radical politician. From 1905 he was president of the Chamber. His views were particularly strong on questions concerning the church and state. Although brought up in the Catholic faith he became a pronounced freethinker.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. See BIOLOGY.
BRITISH COAL MINERS' STRIKE. See STRIKES.

BRITISH COLUMBIA. A province of the Dominion of Canada (since July 1, 1871). Capital, Victoria (population, 1911 census, 31,660). Area, 355,855 square miles; population, 1911 census, 392,480. Lieutenant-governor (in 1912, appointed 1909), Thomas W. Patterson. There are an executive council (responsible ministry) of seven members and an elective legislative assembly of forty-two members. Premier in 1912, Sir Richard McBride. See CANADA.

The provincial general election gave the Conservatives a decisive majority. An important factor was the great personal popularity of the premier, Sir William McBride. The extensive programme of railway building held the people together. Not a Liberal secured a seat and only two Socialists won against the Conservatives. The delegation to the Dominion House of Commons continued to be solidly Conservative.

BRITISH EAST AFRICA PROTECTORATE. The territory lying between the Umba and the Juba rivers, from German East Africa to Italian Somaliland and Abyssinia, and inland to Uganda; a British dependency. Area (estimated), about 200,000 sq. miles, inclusive of coast territory leased from the sultan of Zanzibar. Population (1901), about 4,000,000; estimated population in 1910, of the administrative districts only, 2,295,336. Mombasa, the largest town and chief port, has a population of about 30,000 (230 Europeans). Nairobi (14,000 inhabitants, of whom 700 are Europeans and 3171 Indians) is the administrative headquarters and the central station of

the Uganda Railway. At Kilindini improvements are in progress that will make it the finest harbor on the east African coast and the centre of trade for equatorial Africa. In 1910, of the 389,598 acres (6216 freehold, 383,382 lease) classed as productive, 369,746 were devoted to grazing, 19,852 to crops. Cattle, sheep, and ostriches are raised. The crops include grains, coconuts, cotton, sisal, rubber, tobacco, coffee, and fruits. The worked mines yield carbonate of soda, limestone, graphite, and gold. The cost of construction of the Uganda (Mombasa-Victoria) Railway (585 miles) to March 31, 1911, was approximately £5,683,297. Two branches were under construction in 1912, one to Magadi Lake and the other from Nairobi towards Port Heli. On the line from Jinja at the Ripon Falls, Victoria Nyanza Lake to Kakindu on the Nile, navigation was opened. Four steamers are operated on Victoria Nyanza in connection with the railway. Railway passengers carried (1910-11), 403,224; tons of goods, 77,478; revenue, £300,116; expenditure, £201,596. The telegraph system, exclusive of the lines in Uganda, has 2263 miles of line (the railway line has three wires).

	1907-8	1908-9	1909-10	1910-11
Imports	£799,717	£797,158	£775,246	£1,000,346*

* Agricultural implements, £29,265; apparel, £25,065; cotton goods, £261,141; cereals, £80,664; machinery, £24,840; provisions, £77,351; sugar, £33,332; tobacco, £22,697.
† Copra, £30,608; grain, £59,166; hides and skins, £62,258; ivory, £21,975; rubber, £31,963.
‡ Uganda Railway, £283,617; licenses and taxes, £162,734; customs, £78,123; posts and telegraphs, £22,725; fines and court fees, £19,857; government property, £18,351.
§ Tonnage entered at Mombasa and Kilindini.

The import figures are exclusive of railway material, government stores, and specie. The United Kingdom supplied imports to the value (1910-11) of £359,556, and received exports valued at £354,525; British possessions, £250,276 and £85,986; Germany, £105,154 and £185,222; the United States, £70,022 and £132,419; the Netherlands, £67,313 imports; France, £112,658 exports.

The governor (appointed 1911) was, in 1912, Col. Sir Percy Girouard.

BRITISH GUIANA. A British colony on the northeast coast of South America. Area, 90,500 square miles; the interior is unbroken forest. The census of 1911 gave returns as follows: 6901 aborigines, 126,517 East Indians, 114,780 negroes, 2622 Chinese, 706 Africans, 10,084 Portuguese, and 3937 other Europeans; a total of 296,041 (153,717 males, 142,324 females). The unenumerated aborigines inhabiting the unsettled parts of the country are roughly estimated at 10,000. Population (1891) of Georgetown, the capital, 57,528. Cotton and coffee, once important products, have declined; sugar production is now the main industry. There are 44 sugar plantations, with a combined area of 156,666 acres (73,324 under sugar-cane, 5196 under plantains, etc., and the remainder unproductive). The export in 1910-11 was 100,954 tons of sugar (in great part Demerara crystals), 2,515,176 pf. gallons of rum, 179,163 gallons of molasses, and

2930 tons of molascuit. Rice is grown in the lowlands, on about 36,000 acres (export in 1910-11, 8,472,214 pounds). Batatas, timber, and charcoal are also exported. Rubber is cultivated.

Gold and diamond diggers, about 10,000; gold exports (1910-11), 55,543 ounces; diamond export, 3009 carats. About half the trade is with Great Britain and a third with the United States. Railway lines: Georgetown to Rosignoi, 60½ miles; Vreeder Hoop to Greenwich Park, 15; branch line to the gold diggings, 18¾. There are telegraph, telephone, and cable systems.

	1907-8 (In £)	1908-9 (In £)	1909-10 (In £)	1910-11 (In £)

Trade is inclusive of transit (£97,998 in 1910-11) and bullion and specie. † Tonnage entered and cleared. ‡ Flour, £185,318; manures, £150,065; textiles, £143,440; machinery, £257,161; oils, £56,414; currency, £57,464, etc. § Raw sugar, £1,040,464; gold bullion, £198,119; batatas, £139,623; spirits, rum, £95,215; rice, etc., £50,603; timber, etc., £35,538; molascuit, £21,930; molasses, £7541; charcoal, £8488; diamonds, £6161; etc.

Customs revenue (1910-11), £329,578. Public debt, March 31, 1911, £887,115. Sir F. M. Hodgson (appointed 1909) was governor in 1912 (Charles T. Cox, acting).

BRITISH HONDURAS. A British crown colony on the east coast of Central America. Area, 8598 square miles; population (1911 census), 40,510. Belize, the capital, had (1911) 10,478 inhabitants; Stann Creek, 2640; Corosal, 1789; Orange Walk, 856. Valuable forests are alternated with stretches of rich arable land on which oil-bearing nuts, vanilla, etc., grow wild in great profusion. Wood-cutting is the main occupation of the people; output 1910: 10,175,571 superficial feet of mahogany, 711,237 of cedar, and 3669 tons of logwood. The fruit export (1910) included 441,181 bunches of bananas, 3,514,101 plantains, and 4,871,321 cocoanuts; other products are sapodilla gum (2,790,890 pounds in 1910), rubber (16,835 pounds), and sponges and tortoise-shell (2703 pounds). Specie export, £15,475. Total imports in 1910 amounted to \$2,819,217; exports, \$2,344,380; revenue (1910-11), \$459,295; expenditures, \$542,810; customs revenue, \$258,118; tonnage entered and cleared, 979,427; public debt, \$168,815. Col. Sir E. J. E. Swayne was governor in 1912 (W. Collet, acting).

BRITISH INDIA. See INDIA, BRITISH

BRITISH NEW GUINEA. See PAPUA.

BRITISH NEW GUINEA. See EXPLORATION.

BRITISH NORTH BORNEO. The northern part of the island of Borneo, forming together with adjacent islands, a British protectorate, under the jurisdiction of the British North Borneo Company. Area, 31,000 square miles. The 1911 census returns about 208,000 inhabitants, mainly Bruneis, Illanuns, Bajaus, and Sulus on the coast, Dusuns, Muruts, etc., in the interior—peaceable in the main, but occasionally engaging in head-hunting expeditions. The Europeans number 355, and the Chinese 28,000. The exports go al-

most entirely to Singapore and China, and consist of timber in considerable quantities, tobacco (nearly three million dollars' worth in 1908), rubber, cocoanuts, sago, coffee, pepper, cattle, cutch, etc. The chartered company does not engage in trade. Coal is worked, iron ore and oil have been discovered. British, Mexican, and other dollars having ceased to be legal tender, the Straits Settlements dollar (worth \$0.56776) is now the standard coin. Completed railways, 120 miles. Imports (1910), 3,801,306 S. S. dollars; exports, 4,809,021; shipping entered and cleared, 316,499 tons; revenue proper, 1,752,791 dollars; land sales, 143,932; expenditure, 815,207. The company administers the country through a resident governor (F. R. Ellis in 1912). Sandakan (administration headquarters), Jesselton, Lahat, Datu, Tawao, and Kudat are the principal towns or stations.

BRUNEI (3000 square miles, 30,000 inhabitants), on the northwest coast, is under British protection.

BRITISH SOLOMON ISLANDS PROTECTORATE. The southern islands of the group, under British protection, have a total area estimated (March 31, 1911) at 14,800 square miles (according to the *Handbook of the British Solomon Islands Protectorate*, 1911); and an estimated population of 150,000 natives and 443 foreigners (252 British). Head-hunters and cannibals exist among the native tribes. The climate is unhealthy. The British resident-commissioner (C. M. Woodford in 1912) has his headquarters at Tulagi. Imports (1910-11) £103,147; exports, £88,890 (copra, pearl, and tortoise-shell, etc.); revenue, £14,130; expenditure, £9493.

BRITISH SOMALILAND. A British protectorate on the Gulf of Aden. Area, about 68,000 square miles; population (1911), 302,859, largely wandering tribes of Mohammedans. Berbera, Bulhar, and Zeila are the chief ports. Livestock constitutes the wealth of the country. Imports amounted in 1910-11 to £267,183; exports, £247,333; revenue, £30,862; expenditure, £99,224; grant-in-aid, £101,000. Administrator (1912), H. A. Byatt.

BRITISH TRADE UNION CONGRESS. See TRADE UNIONS.

BRITISH WEST AFRICA. See articles on NORTHERN NIGERIA, SOUTHERN NIGERIA, GOLD COAST, SIERRA LEONE, and GAMBIA.

BROOKLYN RAPID TRANSIT COMPANY. See RAPID TRANSIT.

BROWN, JUSTUS MORRIS. An American soldier, died December 21, 1912. He was born in Claremont County, Ohio, in 1840. He studied medicine at the University of Pennsylvania and in 1862 was appointed assistant surgeon in the United States army. He served through the war, reaching the rank of captain and assistant surgeon. After the close of the war he was promoted through various ranks until in 1901 he was made colonel and assistant surgeon-general. In 1903 he was retired at his own request after 40 years of service. By act of Congress he was advanced to the rank of brigadier-general, retired, in 1904. He received brevets of captain and major in 1865 for faithful and meritorious services during the war.

BROWNE, WILLIAM HAND. An American writer, educator and librarian, died December 13, 1912. He was born in Baltimore in 1828. He graduated from the medical department of the University of Maryland in 1850. In 1879

he was appointed librarian and assistant professor of English literature at Johns Hopkins University and in 1891 was made full professor of English literature and held this chair until 1910, when he became professor emeritus. He was author of, *Maryland, the History of a Palatinate*; *George Calvert and Cecilius Calvert, Barons Baltimore*; *Life of Alexander H. Stephens* (with Colonel R. M. Johnston). He compiled the *Clarendon Dictionary of the English Language* and *Selections from the Early Scottish Poets*. He was the translator of several works from Latin and from French and German. In 1867-8 he edited the *Southern Review* and from 1870 to 1875 the *Southern Magazine*. He was the editor also of *The Archives of Maryland*, and other historical works.

BROWNING, ROBERT WIEDEMANN BARRETT. Son of Robert and Elizabeth Barrett Browning, died July 7, 1912. He was born in 1849 and lived the greater part of his life in Italy. He adopted art as a profession and for several years studied at Antwerp. He then returned to Italy and lived with his father in the Palazzo Rezzonico, Venice, where on December 12, 1889, Robert Browning died. The son afterwards erected a home on a piece of ground at Asolo where his father had hoped to build his Pippa's Tower. His most notable literary venture was the publication in 1899 of the *Love Letters of Robert and Elizabeth Browning*.

BROWN UNIVERSITY. The total number of students enrolled in all departments of the university in the autumn of 1912 was 934. Of these, 634 were men in the undergraduate department, 211 were in the women's college, and 89 were graduate students. The faculty numbered 84. Among the important changes in the faculty during the year were the following: President W. H. P. Faunce was on leave of absence during the year and Professor W. G. Everett was appointed acting-president. Professor Alexander Meiklejohn (q. v.) resigned the chair of logic to become president of Amherst College. Professor A. H. Jones was appointed to fill the vacancy as professor of logic. Professor Meiklejohn was also dean of the university, and Professor O. E. Randall was made dean in his place. Professors J. I. Manatt, H. T. Fowler, L. T. Damon, and C. von Klenze were on leave of absence during the year. Dr. S. S. Colvin was appointed professor of educational psychology. The movement to raise the million dollar endowment fund of the university was successfully completed in June, 1912. The payments on the fund will not be completed for two years. The income of the university from investments for the year 1911-12 was \$123,730; from other sources, \$118,571. There were about 195,000 volumes in the library. President, W. H. P. Faunce, D. D.

BRUNEL. See BRITISH NORTH BORNEO.

BRUSH, GEORGE JARVIS. An American mineralogist and educator, died February 6, 1912. He was born in Brooklyn in 1831 and was educated privately. He studied chemistry and mineralogy at the Sheffield Scientific School and in 1850 went to Louisville as assistant to Professor Silliman in the university in that city. In 1852-3 he was assistant in chemistry at the University of Virginia, and for three years following 1853 he studied in Europe. In 1855 he was appointed professor of metallurgy at the Sheffield Scientific School. He held this chair until 1871. For a portion of this time he acted

also as professor of mineralogy and later was made professor of this branch alone. He held this chair until 1898 when he was appointed professor emeritus. He was director of the Sheffield Scientific School from 1872 to 1898. He was a member of many learned and scientific societies in the United States and foreign countries. He wrote extensively on mineralogical subjects.

BRYAN, WILLIAM J. See PRESIDENTIAL CAMPAIGN.

BRYN MAWR COLLEGE. An institution for the higher education of women at Bryn Mawr, Pa., founded in 1885. The students enrolled in the college on November 1, 1912, numbered 442. Of these, 69 were graduate students, and 373 undergraduates. The faculty numbered 61. New additions made to the faculty at the beginning of the year included the following: Don Roscoe Joseph, M. D., was appointed associate professor of physiology; Clarence Henry Haring, was appointed associate in history; James Fulton Fergusson, Ph. D., was appointed associate in ancient history and in Latin; Thomas Clachar Brown, Ph. D., was appointed associate in geology; James Ryals Conner, Ph. D., was appointed associate in mathematics; Roger Frederic Brunel, Ph. D., was appointed associate in chemistry. Important benefactions received during the year included a legacy of \$750,000 from Carola Woerishoffer, a graduate of the college in the class of 1907. This sum has been set aside by the board of directors as a special endowment fund. The sum of \$25,000 was collected and presented by the class of 1905 for the purpose of building an infirmary for the college. This infirmary was approaching completion at the end of the year. The endowment fund of the college amounted at the end of the year 1911-12 to \$1,890,334. The library contained 67,209 volumes. President, M. C. Thomas, Ph. D., LL. D.

BUBONIC PLAGUE. See PORTO RICO, and PLAGUE.

BUCHHOLZ, CHARLES WALDEMAR An American engineer, died October 20, 1912. He was born in Hettin, Prussia, in 1843 and received his education as an engineer in that country. In 1861 he removed to the United States, where he entered the navy as an ensign. He afterwards resigned and took up the practice of engineering. From 1877 to 1880 he was chief assistant engineer of the Madeira and Mamore Railroad in Brazil. He was afterwards for many years chief engineer of the Erie Railroad. In 1907 he retired from active service on this road but continued to be consulting engineer. In addition to his work for the Erie and other railroads he was president and chief engineer of the Quaker City Elevated Railroad, an enterprise which resulted in failure. Mr. Buchholz was at one time spoken of as consulting engineer for the Panama Canal. He was one of the leading engineers of the United States.

BUCKHOUT, WILLIAM A. An American educator, died December 3, 1912. He was born at Oswego, N. Y., in 1848 and graduated from the Pennsylvania State College in 1868. In the same year he was appointed instructor in natural science in that institution. In 1871 he became professor of botany and horticulture and served in this capacity until his death. He became widely known through his research work in connection with the department of agri-

culture of Pennsylvania. He was a Fellow of the American Association for the Advancement of Science.

BUCK STOVE COMPANY CASE. See **BOYCOTT.**

BUCKWHEAT. The data relating to the yields of buckwheat in 1912 in the principal buckwheat growing countries indicated a normal world's production. Russia produced 57,178,000 bushels; Canada, 10,924,000 bushels, and the United States, 19,249,000 bushels. France grows annually over a million acres, and produces normally about 25,000,000 bushels. The crop is also grown in Germany and other European countries, but statistics are not available. This year the culture of the crop and particularly the harvest was seriously interfered with in Europe by wet weather. In the United States the production of buckwheat during recent years has shown a tendency to increase. The crop of 1912 was the largest since 1868 and was about 20 per cent. above the 5-year average. The farm value per bushel on December 1, 1912, as given by the Department of Agriculture was 66.1 cents and on this basis the total value of the crop was \$12,720,000, which exceeded the 5-year average by more than 12 per cent., and which has been exceeded since 1869 only by the value of the crop of 1911, the difference being only \$15,000, due to the higher bushel value of 72.6 cents. Among the twenty-four States reporting buckwheat yields in 1912 Pennsylvania ranked first with 7,405,000 bushels, New York second with 6,593,000 bushels, Michigan third with 1,088,000 bushels, and West Virginia fourth with 888,000 bushels. The average yield per acre for the entire country was 22.9 bushels as compared with 21.1 bushels in 1911. The highest average acre-yield for any State in 1912 was 31 bushels, produced in New Hampshire, which had an area of only 1000 acres.

BUDGETS. See **MUNICIPAL GOVERNMENT.**

BUILDING OPERATIONS. The table in the next column prepared by the United States Geological Survey shows the building operations in a number of the leading cities of the country in 1910-11. Of the 51 cities included in this table 28 showed a decrease and 23 an increase in 1911. The total increase was \$29,762,561; the total decrease was \$62,672,039, a net decrease of \$32,909,478 or 4.48 per cent. In 1910 29 of these cities showed an increase and 22 a decrease, the net decrease in that year being \$7,824,566 or 4.90 per cent. The greatest decrease in 1911 was in New York City, \$18,371,910. The greatest increase was in Cincinnati, O., \$4,635,670, or 57.57 per cent.

BUILDINGS, TALL. See **TALL BUILDINGS.**

BUKOWINA. See **AUSTRIA-HUNGARY, Area and Population.**

BULGARIA. One of the "Balkan states"; a constitutional monarchy of Europe. Formerly a principality under the suzerainty of Turkey. Capital, Sofia.

AREA AND POPULATION. Area and population (December 31, 1910) are shown below:

of whom 2,887,684 were Bulgarians and 530,275 Turks; in 1910 the Bulgarians numbered 4,293,853 and the Turks 23,632. Sofia had, in 1910, 102,812 inhabitants; Varna, 47,981; Ruschuk, 36,255; Slivno, 25,142; Shumla, 22,225; Plevna, 23,049. Philippopolis, the capital of Eastern Rumelia, had, in 1910, 47,981 inhabitants. Movement of population 1909: 38,917 marriages, 172,583 living births, 1544 stillbirths, 113,304 deaths; surplus of births over deaths, 59,279. The national religion is the Orthodox Greek, but the Bulgarian Church is not included in the Orthodox communion. In 1909-10 there were reported to be 3786 elementary schools with 8697 teachers and 430,011 pupils (262,394 boys and 167,717 girls.)

PRODUCTION. The following table shows main crops, area in hectares devoted to each in 1911 and 1912; yields in quintals, and average yield per hectare in 1912.

COMMERCE AND COMMUNICATIONS. In the table below will be found imports and exports in thousands of leva:

	1908	1909	1910	1911
Imports	130,150	160,430	177,357	199,345
Exports	112,357	111,434	129,052	184,634

In thousands of leva the details of the 1910 trade are as follows: Imports—textiles, etc., 49,383; metals, etc., 23,299; machinery, etc., 19,777; colonial products, 10,348; skins, etc., 9188; timber, etc., 6993; chemical products, 5538; resins and oils, 5109; paper, etc., 3772. Exports—cereals, 80,811; animal products, 13,002; textiles, etc., 10,037; animals, 7324; perfumes, 5555; skins, 4038; colonial products, 2056; metals, etc., 1127; woodenwares, 656; etc. In the order of their import importance

	Hectares		Quintals		Qa.
	1911	1912	1911	1912	ha.
Wheat	1,118,409	1,120,500	19,596,528	17,350,000	15.5
Rye	220,721	215,000	3,751,176	3,150,000	14.7
Barley	251,178	280,000	4,425,593	4,000,000	15.4
Oats	180,797	160,000	2,967,735	1,750,000	10.9

† Estimate.

‡ Most.

the countries of origin and destination were Austria-Hungary, Germany, Great Britain, Turkey, France, Belgium, Italy, etc.

Total railway lines constructed and in operation in 1910, 1,891,800 kms., of which 1,888,920 kms. operated by the state. Four lines of railway were under construction in Bulgaria during the opening months of the year, previous to the outbreak of the war. Until 1908, 435,555 kms. of the foregoing belonged to Turkey and to the Compagnie Orientale, but were in that year bought by the Bulgarian government. The value of all lines is given (1909) as 225,530,645 leva; of rolling stock, at 24,942,487. Net receipts (1909), 19,187,200; net expenditures, 13,873,687.

FINANCE. A table showing revenue and expenditure for three years in leva (1 lev=19.3 cents):

	1910	1911	1912*
Revenue	173,389,493	178,445,300	190,273,440
Expenditure ...	163,451,041	178,395,443	188,929,057

*1912 estimate.

In 1911 the revenue from customs amounted to 63,230,000 leva; direct taxes, 39,949,000; transport, 30,420,000; domains, etc., 12,680,000; imports, 10,710,000; licenses, 9,450,000; fines, 1,031,000. Expenditure for public debt, 40,440,000; war, 39,642,000; public works, 30,382,000; instruction, 23,598,000; interior, 10,460,000; commerce and agriculture, 10,083,000; finance, 8,443,000; foreign affairs, 6,452,000; justice, 5,836,000. On January 1, 1911, the public debt stood at 555,590,213 leva.

NAVY. At the opening of the war with Turkey the navy contained 6 first-class torpedo boats (*Smely, Hrabry, Derzky, Choumny, Letiachty, and Strogly*) of 100 tons each; one cruiser (*Nadejda*) of 735; two yachts, one transport; two second-class torpedo boats of 20 tons each; and some small craft.

ARMY. During 1912 an opportunity was afforded to test the efficiency and training of the army of Bulgaria. The expectations of military critics who had observed the organization, training, and equipment of this force during the ten years preceding the outbreak of hostilities in the Balkan War, were more than realized. The army is recruited from a contingent of about 80,000 young men who become available each year and of these 24,000 are usually embodied in the standing army, which on a peace basis was maintained with about 3500 officers and 61,000 men. Military service is compulsory from the age of 20 for a period of 25 years and in case of war the young men may be summoned at the age of 17. In the active army 2 years are spent in the infantry and 3 years in the other arms of the service, though in practice this had been

reduced somewhat. There was service in the reserve of the active army for 18 years in the infantry and for 16 years in the other arms, with an annual training period of from 14 to 18 days. In the first Ban of the militia 4 years' service is required in the infantry and 5 years in the other arms, with from 7 to 21 days a year training. In the second Ban of the militia 2 years with from 3 to 7 days' training is required for all arms of the service. The system of organization and recruitment with its feature of a large reserve was designed to put a strength of 380,000 officers and men with about 425 guns into the field upon mobilization. How far this was realized during the year will be found discussed in the articles on **MILITARY PROGRESS** and **TURKEY AND THE BALKAN PEOPLES**.

GOVERNMENT. The executive authority is vested in a king (since October 5, 1908). Ferdinand I., king of the Bulgarians, was born at Vienna, February 26, 1861, son of Prince Augustus of Saxe-Coburg and Gotha. Prince Boris (born January 30, 1894) is the eldest son of the king's first marriage, in 1893, to Princess Marie Louise of Parma.

The ancient Bulgars were of Finnic stock; the modern Bulgarians are made up of Slavic, Teutonic, and Mongoloid elements, amalgamated with Mussulman and Greek. Their language belongs to the southern Slavic group and the Cyrillic alphabet is used.

By the constitution of 1879 (amended 1893 and 1911), the legislative authority was vested in a single chamber, the Sobranje, whose members are elected by universal manhood suffrage (one member to every 20,000 of the population). The king acts through a council of ministers nominated by himself. The ministry as constituted March 29, 1911, was composed in 1912 as follows: Iv. Ev. Guechov, premier and minister for foreign affairs; T. Theodorov, finance; M. Pelev, instruction; P. Abrachev, justice; Gen. W. Nikyphorov, war; Chr. Theodorov, commerce, industry, and labor; D. Christov, agriculture and state domains; D. Yablansky, public works; A. Franghia, railways, posts, and telegraphs; interior and public sanitation, vacant.

HISTORY

In February the treaty with Russia concerning reimbursement for the cost of Russian occupation of Eastern Rumelia was signed. It provided for the payment of 10,680,250 roubles in bi-annual installments of 250,000 roubles each, without interest, until the debt should be liquidated. The treaty was submitted to the Sobranje for ratification. On August 15, 1812, Bulgaria celebrated at the ancient capital Tirnovo the twenty-fifth anniversary of the accession of Prince Ferdinand

of Saxe-Coburg-Gotha, who in 1908 was proclaimed king and has since been recognized in that capacity by the European powers. The extraordinary advance of Bulgaria under his rule as shown by the events of 1912 makes a brief review of her recent history desirable. In the closing months of 1912 the splendid successes of Bulgaria in the Balkan War proved that a new and vigorous national state had developed in eastern Europe. Twenty-five years before when Ferdinand assumed the duties of government Bulgaria, newly liberated from the Turks, was regarded as an insignificant principality and a catspaw of Russia. At that time (1887) only a year had passed since his predecessor, Prince Alexander, had been punished for his attempt to pursue the aim of national independence by enforced abdication and transportation to Russian soil. Russia denounced the union with Eastern Rumania, urged the Turks to reconquer what they had lost, recalled her representatives from Bulgaria, and forbade the meeting of the Sobranje. Russophile uprisings and conspiracies were only put down by the ruthless methods of Stambouloff. In the disordered conditions which Prince Ferdinand found, he fell in with the high-handed policy of Stambouloff as the lesser of the two evils, though he saw the need of coming to terms with Russia as soon as circumstances permitted. Stambouloff was virtually dictator, and during the first years of his reign, Prince Ferdinand's situation was precarious. Russia declared him a usurper; Turkey refused to acknowledge him, and Austria withheld her support. The Orthodox bishops refused to do him homage and were expelled by Stambouloff. Brigandage attributed to Russian influence was common and a Russian officer attempted a military raid on Burgas. A political ally of Stambouloff was assassinated at Sofia, and the Bulgarian representative at Constantinople was murdered. Stambouloff brought to light a military conspiracy under Major Panitzka and the latter was executed. The severity and arbitrary nature of Stambouloff's course caused the prince much anxiety and finally he broke openly with Stambouloff, who resigned in 1894. A year afterwards the latter was murdered in Sofia by Macedonian avengers of Major Panitzka's death. From this time Prince Ferdinand sought the friendship of Russia. On February 14, 1896, the conversion of the heir-apparent, Prince Boris, to the Orthodox faith, secured Russia's good will. Soon afterwards Turkey and the other powers recognized Prince Ferdinand and his position became secure. Russian influence was again paramount, but was not exerted in internal affairs. The fear of the Bulgarian people, however, that the designs of Russia would result in arrangements prejudicial to the interests of the Bulgars in Macedonia offered a serious difficulty. A revolt in Macedonia in 1903 was suppressed with great cruelty. The rivalry there between Greeks and Bulgars was another element of danger. When the opportunity for independence presented itself in 1908 the popular demand for it could not be disregarded, and at Tirnovo on October 5 of that year, Prince Ferdinand proclaimed the independence of Bulgaria and assumed the royal title. Since then the aim of his policy has been the maintenance of friendly relations with Russia and Austria.

BULGARIA AND TURKEY. The incessant quar-

rels between Bulgars and Turks in Macedonia had several times brought the two countries to the verge of war. The popular demand for the liberation of Macedonia from the Turk grew more pressing in the summer of 1912, especially after the Kotchana massacre (see **TURKEY**, paragraphs on *History*). For the events preceding the war and for an account of the war itself, see **TURKEY AND THE BALKAN PEOPLES**.

BULL MOOSE. See **PRESIDENTIAL CAMPAIGN**.

BURNHAM, DANIEL HUDSON. An American architect, died June 1, 1912. He was born in Henderson, N. Y., in 1846 and moved with his parents to Chicago in 1856. He was educated in private schools in that city and studied under private instructors in Waltham, Mass. He studied architecture in Chicago and in 1872 became senior member of the firm of Burnham and Root. This firm in 1891 became E. H. Burnham & Company. He first attained eminence as an architect in the designing of skyscrapers. He with his partner John Well-born Root designed "The Rookery" in Chicago and this was followed by designs for the Masonic Temple, the Great Northern Hotel, Railway Exchange, Marshall Field's department store, and other well-known buildings. He also designed buildings in San Francisco, Buffalo, Cleveland, Philadelphia, Pittsburgh, and Detroit. The Columbian Exposition of 1893 first directed his attention forcibly to the building of cities. The chief architect of the Exposition was Mr. Root, but he died when the work was well under way and Mr. Burnham became supervising architect of the Exposition. As the designer of the exposition buildings and the organizer and controlling operator of all the forces which carried out that undertaking, he achieved an international reputation. He began to receive appeals from cities for plans to increase their beauty. He became chairman of the National Committee for the beautifying of Washington, the other members of which were C. F. McKim, Augustus St. Gaudens, and Frederick Law Olmstead, Jr. Under the plans prepared by this commission the work of beautifying the national capital is now being carried on. One of Burnham's personal contributions to the scheme is the new Union Station in Washington. He was also chairman of the committee which prepared plans for beautifying the city of Cleveland, and after the San Francisco earthquake he perfected a scheme for remodeling the plan of the city, which, however, was not undertaken. The United States government sent Mr. Burnham to the Philippines to reconstruct the cities of Manila and Baguio. Plans prepared by him are being carried out in Chicago. He was a Fellow of the American Institute of Architects and was its president in 1894.

BURTSELL, RICHARD LALOR. An American Roman Catholic priest, died February 4, 1912. He was born in New York City in 1841 and after studying at Fordham University and in Rome was appointed assistant to Monsignor Preston, rector of St. Anne's Church in New York City. He was soon appointed rector of the Church of the Epiphany. Dr. Burtzell came into prominence in 1890 when he was deposed by Archbishop Corrigan on account of his espousal of the cause of Dr. Edward McGlynn in the famous controversy which led to Dr. McGlynn's excommunication. The Arch-

bishop made charges to Propaganda at Rome and these were sustained. Dr. Burtzell was removed from his parish and sent to Rondout. The Church of the Epiphany endeavored to have Dr. Burtzell restored to his pastorate and in 1893 a petition signed by 50,000 residents of New York City was presented to Monsignor Satolli, the papal delegate in Washington. Monsignor Satolli replied that the only course was a personal appeal to the Pope. In 1894 Dr. Burtzell went to Rome and asked the Pope to leave the final decision to Monsignor Satolli. There was no result from this intercession, and in 1898 Dr. Burtzell was made an irremovable rector by Archbishop Corrigan. In 1901 he was appointed rural dean for Ulster and Sullivan counties. This was taken to signify a complete reconciliation with the church authorities. Dr. Burtzell accompanied Cardinal Farley on his visit to Rome to receive the cardinal's hat in 1911. He was appointed a domestic prelate at that time.

BURT, SILAS WRIGHT. An American soldier and civil service reformer, died December 1, 1912. He was born in Albany, N. Y., in 1830 and graduated from Union College in 1849. He studied engineering and from 1849 to 1854 was civil engineer. He served as colonel and assistant inspector-general in New York State from 1861 to 1868. During the Civil War he was engaged in raising, organizing, and equipping volunteers for the Civil War. He was special deputy naval officer at the port of New York from 1869 to 1878 and was naval officer from 1878 to 1883. From 1883 to 1885 he was chief examiner of the State civil service. He was again naval officer of the port from 1885 to 1889. In 1895 he was appointed a member of the civil service commission of New York and served in this capacity until 1900 and was its president in this year. He was one of the founders of the Civil Service Reform Association of New York and of the National Civil Service Reform League.

BUSINESS CONDITIONS IN 1912. See FINANCIAL REVIEW.

BUTLIN, SIR HENRY TRENTHAM. An English physician, died January 24, 1912. He was born in 1845 in Camborne, Cornwall, and was educated by private tutors. He received his professional education at St. Bartholomew's Hospital, where he became house surgeon in 1868. After the expiration of his term in this position he practiced for some time in the country, but in 1870 returned to London where he obtained a fellowship in the College of Surgeons in 1871. He rapidly became one of the most eminent surgeons in England. He served in various important positions in St. Bartholomew's Hospital, acting as chief surgeon from 1892 to 1902. In 1909 he was elected president of the Royal College of Surgeons and retained this position until within several months of his death. He made a careful investigation into the subject of cancer and in November, 1911, delivered two lectures on the parasite of cancer, which may be described as the latest attempt at the solution of the problem. He first brought forward the theory that the cancer cell is a parasite, in 1905, and the lectures in 1911 were in amplification of that theory.

BUTT, ARCHIBALD CLAVERING. An American soldier, died at sea, April 15, 1912. He was born in Georgia in 1871 and was educated at Sewanee University, Tenn. He engaged in

newspaper work and was for a time Washington correspondent for five newspapers in the South. He afterwards became secretary of the American Legation in the City of Mexico. He then resumed newspaper work and wrote several novels based on his Mexican experiences. He entered the army as captain in one of the volunteer regiments that served in the Philippines at the time of the Spanish-American War. He was in the Quartermaster's Department and rendered service of remarkable efficiency. On his return from the Philippines he entered the regular army and served in Cuba during the occupation of Havana by the American army. He was then detailed as personal aid to President Roosevelt and he also served President Taft in this position. He was promoted to be a major in 1911. He was one of the victims of the wreck of the steamship *Titanic*, on which he was returning from a brief visit abroad. From the testimony of witnesses, Major Butt conducted himself with the greatest unselfishness and heroism previous to the sinking of the *Titanic*.

BUTTE DAM. See DAMS.

BUTTER. See DAIRYING.

BYERS, MARGARET (MORROW). An Irish educator, died February 21, 1912. She was educated privately and for a short time taught school. She married Rev. John Byers and made her home in Belfast. She became deeply interested in the conditions of Irish women and began efforts for their improvement. She founded and became director of Victoria College, which was prominent in pioneer educational work. The institution began as a secondary school before college education for women had been discussed. In 1878 she worked for the inclusion of girls in the benefits of the Irish Intermediate act. In 1881 the Royal University of Ireland offered its examination and degrees to women. Mrs. Byers was the first Ulster woman to receive an honorary degree from a university. She was a member of the first senate of the Queen's University of Belfast. In conjunction with other women she founded in 1874 the Belfast Women's Temperance Association and Christian Workers' Union out of which was developed the Belfast Prison Gate Mission for Women and the Victoria Homes for the reclamation and training of neglected and destitute girls. She was the first president of the Irish Women's Temperance Union. She was the author of many papers on different phases of the progress of girls' education in Ireland and on Irish industrial schools and temperance. She received the degree of LL. D. from the University of Dublin.

BYRD, ADAM MONBOE. An American public official, formerly congressman from Mississippi, died June 21, 1912. He was born in Sumter county, Ala., in 1859, and when eight years of age removed to Mississippi, where he was educated in the common schools and at Cooper Institute, Daleville, Miss. He studied law at the Columbian University, taking his degree in 1884. From 1887 to 1889 he was superintendent of education in Neshoba county, Mississippi. He was a member of the State senate in 1889, 1890 and 1892, and of the House of Representatives in 1895. In 1897 he was appointed judge of the 6th chancery district of Mississippi and was reappointed in 1901. He was elected to Congress in 1903 and was

successively reflected until 1911, representing the 5th Mississippi district.

CABINET. See UNITED STATES.

CALGARY. See MUNICIPAL GOVERNMENT; COMMISSION PLAN; GARBAGE AND REFUSE DISPOSAL.

CALICE, COUNT. An Austrian diplomat, died August 29, 1912. He was born in 1831. He entered the diplomatic service and from 1880 to 1906 was representative of Austria in Turkey, and he held a place of great influence in Constantinople. He played an important part in nearly all the crises of the period in which he was ambassador and was a strong supporter of the Near Eastern policy of Counts Kalnoky and Goluchowski. His influence was felt especially during the peace negotiations between Turkey and Greece in 1897, and when Austria and Russia agreed upon a programme of reforms for Macedonia he was the chief author of the Austro-Hungarian suggestions. He was identified also with the February and October programmes of 1903 and the reforms to which they led. Soon after the accession of Baron von Aehrenthal as premier, Count Galice retired from official life. Earlier in his diplomatic career he was successively consul and consul-general at Liverpool, consul-general and minister-resident in China, Japan and Siam, and minister to Rumania, and from 1877 to 1880 was one of the principal heads of the department at the Austrian Foreign Office.

CALIFORNIA. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population in the State in 1910 of 2,377,549 the foreign-born whites numbered 517,355, compared with 316,505 in 1900. The largest number, 76,208, came from Germany; from Italy, 63,549; from Ireland, 52,440; from Canada, 41,311; from England, 48,606; from Mexico, 33,384; from Sweden, 26,395; and from Portugal, 22,570. In the City of San Francisco, with a population of 416,912, the foreign-born whites numbered 130,892. Of these 24,121 came from Germany, and 23,127 from Ireland.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911-12 are shown in the following table:

	Acreage	Prod. Bu.	Value
Corn 1912	52,000	1,924,000	\$1,635,000
..... 1911	51,000	1,836,000	1,652,000
Wheat 1912	370,000	8,290,000	8,850,000
..... 1911	480,000	8,640,000	7,603,000
Oats 1912	200,000	7,800,000	4,290,000
..... 1911	210,000	7,140,000	4,213,000
Rye 1912	8,000	141,000	127,000
..... 1911	8,000	136,000	116,000
Rice 1912	1,400	70,000	64,000
..... 1911	150	6,000	4,000
Potatoes .. 1912	78,000	10,140,000	6,591,000
..... 1911	72,000	9,720,000	8,748,000
Hay 1912	2,600,000	3,825,000	52,402,000
..... 1911	700,000	1,225,000	13,352,000

a TONS.

MINERAL PRODUCTION. The total output of the metal mines of the State in 1911, according to the United States Geological Survey, was valued at \$25,174,677, a decrease of \$1,845,728 from the value of the product of 1910. The total decrease was due mainly to the curtailment of the output of copper because of litigation over the smelter fumes question. The value of the production of gold in 1911 was \$19,738,908, an increase over the value of

the output of 1910 of \$23,468. The output of silver amounted to 1,270,445 fine ounces, valued at \$673,336, a decrease of 569,640 fine ounces in quantity and \$320,310 in value from 1910. The output of lead in 1911 was 1,398,111 pounds, valued at \$62,915, a decrease of 1,472,866 pounds in quantity and \$63,408 in value from 1910. The output of zinc, of which none was produced in 1910, was 2,807,035, valued at \$160,001. There were 522 producing gold mines in the State, 11 silver mines, 31 silver-lead, and 30 copper mines, in 1911. There was produced from the placer mines of the State in 1911 gold to the value of \$8,986,527 and 39,541 ounces of silver.

The output of copper in 1911 was 35,835,661 pounds of blister copper, compared with 45,780,200 pounds in 1910. The reduction in output was due to the necessity of eliminating from the smelter smoke ingredients injurious to vegetation. This resulted in the shutting down of all but one of the smelters in the copper-producing districts. At the close of 1911 California had produced about 480,970,000 pounds of copper or 2.9 per cent. of the output of the country since 1845. In 1911 it ranked sixth among the States producing copper. Five plants treated copper ores in 1911, although several were operated for only a short period.

The increased production of petroleum in the State, which has been a marked feature of its mineral history in recent years, continued in 1911, when 81,134,391 barrels were obtained from the wells of the State, compared with a production of 73,010,560 barrels in 1910. California far surpassed all other States in the production of petroleum. The value of her product in 1911 was \$38,719,080. The price per barrel was lower than in 1910, 47.7 cents, compared with a price of 49 cents in 1910. The largest producing field in 1911 was the Kern field which yielded 45,921,712 barrels. From the Fresno fields were obtained 18,483,751 barrels. Explorations carried on in 1911 showed the probable existence of other large fields, which were still undeveloped.

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909 and were compiled in 1912. A summary of the results of the census will be found below:

	P.C. of Number or Amount Inc'ase		
	1909	1904	1904-9
Number of establishments	7,659	6,839	12.0
Persons engaged in manufactures. . .	141,576	120,040	17.9
Proprietors and firm members...	8,077	7,402	9.1
Salaried employees	18,203	12,283	48.2
Wage earners (average numb.)	115,296	100,355	14.9
Primary horsepower.	329,100	210,359	56.4
Capital	\$537,134,000	\$282,647,000	90.0
Expenses	476,154,000	321,928,000	47.9
Services	107,097,000	79,056,000	35.5
Salaries	22,955,000	14,399,000	59.4
Wages	84,142,000	64,657,000	30.1
Materials	325,238,000	215,726,000	50.8
Miscellaneous	43,819,000	27,146,000	61.4
Value of products...	\$529,761,000	\$367,218,000	44.3
Value of prod'ts less cost of materials	204,523,000	151,492,000	35.0

Although agriculture and mining are the principal industries in California, it will be seen from this table that the State showed a marked growth in manufactures during the

period between the last census and the present one. Of the 7659 manufacturing establishments, those devoted to printing and publishing ranked first in number, 1240. Manufactories of bread and bakery products numbered 864; lumber and timber products, 644; foundry and machine shop products, 543; copper, tin, and sheet iron products, 233. The total number of persons engaged in all industries of the State at the time of this census was 141,576. Of these, 123,929 were male, and 17,647 were female. Of the total number of persons engaged in these industries, 9.6 per cent. were proprietors and officials, 8.9 per cent. clerks, and 81.4 per cent. wage earners. The prevailing hours of labor in the State averaged from 54 to 60 a week; 21.1 per cent. of the total were employed in establishments where a week of less than 54 hours prevailed, and 8.8 per cent. in establishments where the prevailing hours were more than 60 a week. The largest number of wage earners were found in San Francisco, where the average number was 28,244; in Los Angeles, 17,327, and in Oakland, 6905. The number of employees in San Francisco decreased about 10,000 in the five year 1904-1909.

EDUCATION. The students enrolled in the public schools of the State in 1912 numbered 423,824. Of these 356,945 were in the elementary schools, 47,420 in the high schools, 9713 in the kindergarten schools, and 3164 in the normal schools. The total enrollment in 1911 was 394,752. The teachers employed in the State in 1912 numbered 13,820, of whom 10,674 were teachers in the elementary schools. The total expenditures for education in 1911 amounted to \$225,604,155. The expenditures for 1912 exceeded that amount by a considerable sum. The total number of elementary school buildings, including primary and grammar schools, was 4081. The average amount paid to teachers in the elementary schools per annum was: For men, \$1010.18, and for women, \$726.94. There were 229 high schools maintained in 55 counties. The total enrollment in the high schools was 47,420.

FINANCE. There was a balance in the treasury at the beginning of the fiscal year, June 30, 1911, of \$7,453,602. The cash receipts during the year ending June 30, 1912 were \$39,323,132. The disbursements amounted to \$36,620,818. There was a balance on hand at the end of the fiscal year of \$9,903,533. The chief receipts are from county taxation and from the taxation of franchises and corporations. The chief expenditures are for education, expenses of the State institutions, and the administration of the State offices.

POLITICS AND GOVERNMENT. The year 1912 was one of great political excitement in the State. Governor Johnson was one of the most aggressive supporters of Mr. Roosevelt and his nomination as vice-president on the Progressive ticket made him one of the most prominent figures in the contest. The fact that women were for the first time to vote in the presidential campaign gave added zest to the contest in the State. The presidential primary, employed for the first time in the history of the State, made still another feature of political interest. The Progressive sentiment in California had been very strong since the organization of the Progressive movement and it was anticipated that in the presidential pri-

mary election held on May 14, Colonel Roosevelt would carry the State. Two days before the election President Taft issued an appeal for the votes of women. This appeal was based solely on the achievements of his administration. It included a short review of the most important acts of the administration, and he appealed to the Republican men and women who exercised the franchise, to consider fairly and well his achievements, especially those which affected California. At the presidential primary election Mr. Roosevelt carried the State by a plurality of nearly 70,000 over Mr. Taft and by a plurality of more than 25,000 over Mr. Taft and Senator La Follette combined. The total vote was as follows: Roosevelt, 138,563; Taft, 69,345; La Follette, 45,876. The total vote cast in the primary was 253,784. This may be compared with a vote in the presidential election of 1908, which was 214,398. Mr. Taft did not carry a single county in the State. Mr. Roosevelt ran second in only one county, which voted for Senator La Follette by a small margin.

The contest for two delegates to the National Convention which formed one of the most discussed cases before the National Committee, will be found treated in the article **PRESIDENTIAL CAMPAIGN** under the head of *Disputed Contests*. These delegates were finally given, by the decision of the committee, to President Taft. In the Democratic primaries Champ Clark defeated Governor Wilson by even greater majority than Mr. Roosevelt obtained over President Taft. Primary elections for representatives to the State and national legislatures were held on September 3. In these elections the Progressive party was again successful by large majorities. More than 80 of the 100 nominees for the State legislature who were elected, were pledged to vote for Roosevelt electors in the legislative convention. The California law provides that the legislative nominees shall constitute a State convention which names candidates for presidential electors. As a result of this election, the Progressive party was given official place on the ballot, while it was necessary for the regular Republican candidates to be nominated by petition. The head of the Progressive movement, Meyer Lisaner, announced, however, on September 7 that the Progressives would waive their right to nominate electors when the convention met on September 24 and would place the Roosevelt electors on ballot by petition.

In accordance with this decision it was necessary for the Taft electors to be nominated by petition. This was neglected until it was too late, and those who wished to vote for President Taft in the election were practically disfranchised. As a result, most of the Republican voters who did not wish to vote the Progressive ticket apparently cast their votes for Governor Wilson. The result of the election on November 5 was so close that it required an official count before it could be determined. The count disclosed that Mr. Roosevelt had a plurality of 164 votes. The total vote was as follows: Wilson, 283,441; Roosevelt, 283,605; Taft, 3943; Debs, Socialist, 69,869. Two Roosevelt electors received fewer votes than Wilson electors, and the electoral vote was therefore eleven for Roosevelt and two for Wilson. The Progressives elected all the representatives to Congress with the exception of 2. A great increase in the total vote in 1912 com-

pared with 1908 is due to the increased number voting as a result of woman suffrage. It is worthy of note that Mr. Roosevelt apparently did not carry the preponderance of the votes of the women in the State in spite of the fact that he was the only one of the candidates who openly advocated woman suffrage.

OTHER EVENTS. On February 26 the Supreme Court of the State decided in favor of the Southern Pacific Railroad in a case involving a claim to California land valued at more than \$1,000,000. Clarence Darrow, chief counsel for the McNamara brothers in the trial in which they were convicted of blowing up the building of the *Los Angeles Times* in 1911, was indicted for bribery on January 27. It was alleged that he had instigated the bribery of a juror in the case to vote for an acquittal of the defendants. Mr. Darrow, after a long trial, was acquitted of the charge on August 17.

On March 23 the legislature rejected the proposed local option amendment to the State constitution.

LEGISLATION. The legislature met in two extra sessions in 1912. Important measures were passed in both these sessions. In the first the following laws were enacted: (1) A measure providing for the registration of voters. (2) An act providing for the confinement and care of persons so addicted to the intemperate use of narcotics or stimulants as to have lost the power of self-control. (3) An act providing for the organization of a State railroad commission, and defining its powers, duties, etc. (4) An act amending the law as to primary elections. This contained in particular one feature which provides for the order in which names are to be printed on the ballots so that as far as possible, each candidate shall have his name at the head of the list on equal terms with all the others. A presidential primary act was passed (see *Politics and Government* above). Other measures provided for the organization and management of municipal water districts, and various acts were passed amending the banking laws of the State. Measures were passed providing for the recall of elective officers of counties and subdivisions thereof; for the initiative and referendum in counties; for the recall of officers of cities and towns; and for the initiative and referendum in cities and towns. Other measures relating to elections regulated election ballots and provided for the appointment of a registrar of voters in counties by the board of supervisors thereof.

At the second session was passed an elaborate act providing for the protection of horticulture, and to prevent the introduction into the State of insects, diseases, or animals injurious to fruit or fruit trees, bushes or vegetables. Constitutional amendments were passed for submission to the people regulating the deposit of moneys belonging to the State and providing for the publication of free text-books.

STATE GOVERNMENT. Governor, H. W. Johnson, Prog.; Lieutenant-Governor, A. J. Wallace; Secretary of State, F. C. Jordan; Treasurer, E. D. Roberts; Comptroller, A. B. Nye; Adjutant-General, Edwin A. Forbes; Attorney-General, U. S. Webb; Superintendent of Education, Edward Hyatt; Commissioner of Insurance, E. C. Cooper; Commissioner of Agriculture, R. L. Telfer—all Republicans, except Governor.

JUDICIARY. Supreme Court: Chief Justice, W. H. Beatty; Associate Justices, H. A. Melvin, Lucien Shaw, F. M. Angellotti, M. C. Sloss, F.

W. Henshaw, W. G. Lorigan; Clerk, B. G. Taylor—all Republicans.

STATE LEGISLATURE, 1913. Democrats, Senate, 12; House, 25; joint ballot, 37. Republicans, Senate, 1; House, 8; joint ballot, 9; Progressives, Senate, 27; House, 46; joint ballot, 73; Socialist, House, 1; joint ballot, 1. Progressive majority, Senate, 14; House, 12; joint ballot, 26.

The representatives in Congress will be found in the article CONGRESS, section *United States*.

CALIFORNIA, UNIVERSITY OF. An institution of higher learning at Berkeley, Cal., founded in 1860. The students enrolled in the university in the autumn of 1912 numbered 6659, of whom 1871 were summer session students. The faculty numbered 407. Among the important additions to the faculty during the year were the following: I. W. Howerth, professor of education and director of university extension; T. F. Hunt, professor of agriculture and director of experiment station; G. N. Lewis, professor of physical chemistry; F. R. Marshall, professor of animal industries; J. T. Nance, professor of military science and tactics; C. L. Seeger, professor of music; W. C. Bray, assistant professor of chemistry; W. W. Bonns, assistant professor of pomology and plant physiologist; C. G. Chinard, associate professor of French; J. V. Cooke, assistant professor of pathology and director of laboratory of animal experimentation; J. E. Dougherty, assistant professor of poultry husbandry; F. S. Foote, Jr., associate professor of railroad engineering; S. J. Holmes, associate professor of zoölogy; Mary L. Kissell, associate professor of domestic art; W. A. Morris, associate professor of English history; P. E. Smith, assistant professor of anatomy; R. C. Tolman, assistant professor of chemistry. The important benefactions of the year included gifts from Mrs. Phoebe A. Hearst of collections and of moneys for maintenance for the Museum of Anthropology, and a rich collection of occidental and oriental manuscripts, early printed books, rare bindings, etc.; from Miss Annie M. Alexander, a gift of \$10,500 for the support of the Museum of Vertebrate Zoölogy; from Ernest V. Cowell, a bequest of \$750,000, one-third of which is to be used for a gymnasium, one-third for a stadium, and one-third for a hospital. A number of other smaller benefactions were also received. The endowments of the university amounted to about \$4,350,000. The total income from all sources for the year 1911-12, not including gifts, was about \$1,800,000. The volumes in the library numbered about 250,000. The most important event in the academic year was the reorganization of the agriculture department in the autumn of 1912. Dr. Thomas Forsyth Hunt, formerly of the Pennsylvania State College, took office on October 1 as professor of agriculture, director of the Agriculture Experiment Station, and dean of the College of Agriculture. The Regents of the university have taken steps to establish one of the foremost agricultural colleges and experiment stations in the United States with important outlying stations in other parts of California. Dr. Herbert John Webber, formerly professor of plant breeding at Cornell University was called to the same professorship at California University. Dr. John Washington Gilmore, president of the College of Hawaii, was appointed professor of agronomy. President, Benjamin Ide Wheeler.

CALIFORNIA FIGS. See **HORTICULTURE**.
CAMBODIA. A French protectorate on the Gulf of Siam; part of the French colony of Indo-China (q. v.). The capital is Pnom-Penh, with 50,000 inhabitants; other towns are Kampot and Khsach-Kandal. A large part of the country is covered with forest. The natives cultivate cotton, rice, betel, tobacco, indigo, cardamons, coffee, cacao, etc.; they also raise cattle and buffaloes. The great lakes are fished in primitive fashion. The most of the trade goes through Saigon (Cochin-China). Sisonath is the native king. The French resident superior was M. Outrey in 1912.

CAMBRIDGE. See **ARCHITECTURE**.

CAMEROON. See **KAMERUN**.

CAMORRA. See **ITALY**.

CAMPAIGN, PRESIDENTIAL. See **PRESIDENTIAL CAMPAIGN**.

CAMPANILE. See **ARCHITECTURE**.

CANADA, DOMINION OF. A British self-governing dependency between the United States and the Arctic Ocean. Capital, Ottawa, Ontario.

AREA AND POPULATION. The following table shows by provinces and territories: (1) Area in square miles, by planimetric calculation, inclusive of 125,765 square miles of water, but excluding the territorial seas, the Gulf of St. Lawrence, and the Canadian portion of the Great Lakes; (2) population according to the census of 1901; (3) population according to the final returns of the census of April 2, 1911; (4) increase per cent. between 1901 and 1911:

Provinces	Area	1901	1911	Inc.
Alberta	255,285	73,022	374,663	413.1
Brit. Columbia	355,855	178,657	392,480	119.7
Manitoba	73,732	255,211	455,614	78.5
New Brunswick	27,985	331,120	351,889	6.3
Nova Scotia	21,428	459,574	492,338	7.1
Ontario	260,862	2,182,947	2,523,274	15.6
Pr. Edward Isl.	2,184	103,259	93,728	9.2
Quebec	351,873	1,648,898	2,032,712	21.5
Saskatchewan	251,700	91,279	492,432	439.5
Yukon (ter.)	207,076	27,219	8,512	68.7
Northwest Territories	1,921,685	20,129	17,196	15.8
Canada	3,729,665	5,371,315	7,204,838	34.1

* Decrease.

The rural population in 1911 was 3,924,394 and the urban 3,280,444, the former figure showing an increase in ten years of 574,878, or 17.16 per cent., and the latter 1,258,645, or 62.25 per cent. The increase over 1901 by provinces was: Alberta, 180,327 rural and 121,314 urban; British Columbia, 100,318 and 113,505; Manitoba, 70,511 and 129,892; New Brunswick, decrease 1493 rural and increase 22,262 urban; Nova Scotia, decrease 23,981 rural and increase 56,745 urban; Ontario, decrease 52,184 rural and increase 392,511 urban; Prince Edward Island, decrease 9546 rural and increase 15 urban; Quebec, increase 39,951 and 313,863 respectively; Saskatchewan, 287,338 and 113,815; Yukon, decrease 13,430 and 5277; Northwest Territories (population wholly rural), decrease 2933. These figures indicate particularly the rapid development of Alberta and Saskatchewan and, in the older parts of the Dominion, the trend of population from country to town.

In 1911 the population comprised 3,821,067 males (53.03 per cent.) and 3,383,771 females (46.97 per cent.); single, 2,369,160 males (32.88), 1,941,354 females (26.94); married, 1,131,564 (18.48), and 1,251,182 (17.37); wid-

owed, 89,121 (1.24), and 179,598 (2.49); divorced, 839 and 691.

Population of the Dominion capital and the provincial capitals in 1911: Ottawa, 87,062; Edmonton, Alb., 24,900; Victoria, B. C., 31,660; Winnipeg, Man., 136,035; Fredericton, N. B., 7208; Halifax, N. S., 46,619; Toronto, Ont., 376,538; Charlottetown, P. E. I., 11,198; Quebec, Que., 78,190; Regina, Sask., 30,132; Dawson, Yukon (ter.), 3013. Other cities: Montreal, Que., 470,480; Vancouver, B. C., 100,401; Hamilton, Ont., 81,969; London, Ont., 46,300; Calgary, Alb., 43,704; St. John, N. B., 42,511; Brantford, Ont., 23,132; Kingston, Ont., 18,874.

Immigrants in years ending March 31: 1910, 208,794 (of whom 59,790 from the United Kingdom and 103,984 from the United States); 1911, 311,084 (123,013 and 121,451); 1912, 354,237 (138,121 and 133,710). The immigrants from the United States are practically all farmers and farm laborers and come principally from the Western States.

EDUCATION. Public instruction is controlled by the separate provincial governments. Primary education is free and, except in Quebec and Manitoba, compulsory.

Alberta. Statistics for 1909 and 1910 respectively: Schools, 970 and 1195; pupils enrolled, 46,048 and 55,307; average attendance, 22,225.06 and 29,611.45; teachers, 1323 and 1610; expenditure on school buildings and grounds, \$769,201 and \$1,062,987; teachers' salaries, \$758,816 and \$908,045 (average in 1910, \$704.97). Total expenditure in 1910, \$3,362,393.

British Columbia. Years ending June 30, 1910 and 1911: Schools, 211 each; pupils enrolled, 39,822 and 45,125; average attendance, 28,094.16 (70.54 per cent.) and 32,163.24 (71.27 per cent.); teachers, 1037 and 1179; expenditure, \$1,917,236 and \$2,641,522 (education proper, \$612,053 and \$715,734).

Manitoba. For 1910: Enrollment, 76,247; attendance, 43,885 (57.55 per cent.); teachers, 2774; expenditure, \$4,000,671.

New Brunswick. During the year ending June 30, 1911, there were enrolled in the public schools 68,951 pupils, compared with 68,154 in 1910. For terms ending June 30, 1910 and 1911: Schools, 1860 and 1885; pupils enrolled, 62,994 and 63,073; average attendance, 42,418 (67.33 per cent.) and 41,597 (65.95); teachers, 1974 and 1975.

Nova Scotia. Years ending July 31, 1910 and 1911: Schools (common and high), 2579 and 2639; pupils enrolled, 102,035 and 102,910; average attendance, 65,629 (70 per cent.) and 61,250 (68.1 per cent.); teachers, 2723 and 2799. Enrollment in common schools, 93,378 and 94,234; high schools, 8657 and 8676; technical schools, 2183 and 2410; government night schools, 123 and 66; grand total, 104,341 and 105,386; expenditure, \$1,265,233 and \$1,379,332.

Ontario. For 1909 and 1910: 1. Elementary schools, 6380 and 6408; pupils enrolled, 456,302 and 459,145; average attendance, 60.17 per cent. and 60.84 per cent.; teachers, 10,274 and 10,518; expenditure, \$8,141,423 and \$9,343,202; average of teachers' salaries, male \$660 and \$711, female \$449 and \$483. 2. Secondary schools, 145 and 146; pupils enrolled, 31,101 and 32,612; average attendance, 20,791 and 20,389 (62.52 per cent.); teachers, 820 and 853; expenditure, \$1,621,637 and \$1,636,166; average of teachers' salaries, \$1195 and \$1250. The total enrollment in elementary and secondary schools,

including kindergartens and night schools, was 508,563 in 1909 and 512,345 in 1910.

Prince Edward Island. Years ending September 30, 1910 and 1911: Schools, 478 and 478; pupils enrolled, 17,933 and 17,397; average attendance, 11,632 (64.8 per cent.) and 10,511 (60.4); teachers, 591 and 591; expenditure, \$181,572 and \$181,177 (of which government \$127,548 and \$126,438). The average of teachers' salaries ranged in the several classes from \$149 to \$410 in 1911.

Quebec. Years ending September 30, 1910 and 1911: Elementary: Schools, 5720 and 5905; pupils enrolled, 218,914 and 226,438; average attendance, 162,928 (74.42 per cent.) and 167,168 (73.82); teachers, 6901 and 7134. Model: Schools, 661 and 671; pupils enrolled, 100,492 and 106,386; average attendance, 82,514 (82.11 per cent.) and 86,758 (81.55); teachers, 2988 and 3186. Secondary: Academies and Roman Catholic classical colleges, 255 and 242; pupils enrolled, 61,740 and 63,439; teachers, 3133 and 3214. Total, including normal schools, night schools, universities, etc.: Schools, 6760 and 6934; enrollment, 394,945 and 410,422; average attendance, 78.23 and 77.53 per cent.; teachers, 14,000 and 14,597. Of the teachers, in the latter year, 3272 were male and 11,325 female; 8532 were lay teachers and 6065 were in religious orders. Aggregate contributions for education in 1909-10, \$6,210,530; in 1910-11, \$6,794,333.

Saskatchewan. Years ending December 31, 1909 and 1910: Elementary schools, 1692 and 1912; pupils enrolled, 53,969 and 63,964; average attendance, 28,202 (52.25 per cent.) and 33,731 (52.80); teachers, 2294 and 2672; expenditure, \$3,032,999 and \$3,586,036 (of which \$1,044,011 and \$1,208,651 teachers' salaries). There are 13 high schools, a normal school, and a training school for teachers for foreign-speaking communities.

AGRICULTURE. In 1911, the area under field crops was 32,404,110. acres, which yielded a value, computed at local market prices, of \$558,099,600, a record figure. Of the total, 22,704,028 acres were under grain crops. The principal crop, wheat, was the largest on record. The following table compares the yield of the leading crops in 1911 with the yield in 1901, and for 1911 shows the acreage and the value (all figures in thousands):

Crops	1000 bu.		1911	
	1901	1911	1000 ac.	1000 \$
Wheat	55,572	215,851	10,374	138,567
Oats	151,497	348,188	9,227	126,812
Barley	22,224	40,641	1,404	23,004
Rye	2,317	2,694	143	2,086
Peas	12,349	4,536	287	4,648
Buckwheat	4,547	8,156	359	5,232
Mixed grains		16,679	560	10,127
Flaxseed		7,867	683	11,855
Beans	861	1,156	61	2,219
Corn for husking	25,876	18,773	316	12,172
Potatoes	55,363	66,023	159	39,358
Turnips, etc.	76,076	84,933	227	19,541
Hay and clover	7,853	12,694	7,903	146,596
Fodder corn		2,577	285	12,469
Sugar beets		177	21	1,165
Alfalfa		228	102	2,249

Crops in 1912 are reported as follows. in metric measure: Wheat, 3,949,029 hectares, 55,979,230 quintals; oats, 3,729,895 ha., 58,835,238 qs.; barley, 572,703 ha., 9,556,819 qs.; rye, 60,176 ha., 783,875 qs.; corn, 118,511 ha., 3,611,514 qs.; flaxseed, 678,972 ha., 5,370,533 qs.;

sugar beets, 7689 ha., 1,850,620 qs. These figures for 1912 show increased production as compared with those for 1911 except in the case of wheat and corn.

Livestock estimates June, 1911: Horses on farms, 2,266,400; milch cows, 2,876,600; other cattle, 4,210,000; sheep, 2,389,300; swine, 2,792,200. See AGRICULTURE, AND AGRICULTURAL LEGISLATION.

HOMESTEADS. Ordinary homestead entries and preëmptions in 1910 and 1911:

Provinces	Homesteads		Pre-ëmptions	
	1910	1911	1910	1911
Manitoba	3,132	2,944
Saskatchewan	26,878	20,681	10,795	6,714
Alberta	18,013	14,960	7,567	3,869
British Columbia	234	324
Total	48,257	38,909	18,352	10,583

Purchased homesteads in 1910, 1863; in 1911, 1514. Entries for South African volunteer homesteads, 2186 and 2064.

MINING. The value of Canada's mineral production increased from \$16,763,353 in 1890 to \$64,420,983 in 1900 and \$106,823,623 in 1910. In 1911 the output declined to \$103,220,994. The following table shows for calendar years the value of the principal mineral products and of the total product, in thousands of dollars:

	1901	1906	1910	1911
Silver	3,265	5,659	17,580	17,355
Nickel	4,595	8,949	11,181	10,230
Gold	24,129	11,502	10,206	9,781

non-metals	23,865	37,337	57,385	57,116
Grand total	65,805	79,287	106,824	103,221

* From Canadian ore.

About half of the coal is now produced in Nova Scotia, two-fifths of the gold in Yukon, more than one-third of the nickel in Ontario, almost all of the silver in Ontario, and of the asbestos in Quebec.

FISHERIES. In the year ending March 31, 1911, the total catch was valued at \$29,965,433, against \$29,629,170 in 1909-10. Value by provinces in 1909-10 and 1910-11: Alberta, \$82,562 and \$82,460; British Columbia, \$10,314,755 and \$9,163,235; Manitoba, \$1,003,405 and \$1,302,799; New Brunswick, \$4,676,315 and \$4,134,144; Nova Scotia, \$8,081,111 and \$10,119,243; Ontario, \$2,177,813 and \$2,026,121; Prince Edward Island, \$1,197,556 and \$1,153,708; Quebec, \$1,808,436 and \$1,692,475; Saskatchewan, \$173,580 and \$172,903; Yukon (ter.), \$82,562 and \$82,460. The most valuable fish taken in the year 1910-11: Salmon, \$7,205,871; cod, \$5,921,248; lobsters, \$3,784,099; herring, \$2,278,842; halibut, \$1,251,839; haddock, \$1,218,759; whitefish, \$983,594; trout, \$825,290. Persons employed in the fishing industry in 1909-10 and 1910-11, 90,357 and 93,588; vessels, 1750 and 1680; boats, 41,170 and 38,977; capital invested, \$17,357,932 and \$19,019,870.

MANUFACTURES. As a part of the Fifth Census, a census of manufactures was taken in June, 1911, for the calendar year 1910. The following table shows the chief general results as compared with figures for 1900 (*a* number of establishments, *b* capital, *c* employees on salaries, *d* salaries, *e* employees on wages, *f* wages, *g* value of raw and partly manufactured materials, *h* products):

	1900	1910	Total	Increase	P. C.
<i>a</i>	14,650	19,218	4,568	31.18	
<i>b</i>	\$446,916,487	\$1,247,583,609	\$800,667,122	179.15	
<i>c</i>	30,691	44,077	13,386	43.61	
<i>d</i>	\$ 23,676,146	\$43,779,715	\$20,103,569	84.92	
<i>e</i>	308,482	471,126	162,644	52.72	
<i>f</i>	\$89,573,204	\$197,228,701	\$107,655,497	120.19	
<i>g</i>	\$266,527,858	\$601,509,018	\$334,981,160	125.68	
<i>h</i>	\$481,053,375	\$1,165,975,639	\$684,922,264	142.38	

The returns for 1910 compared with those for 1905 show the increase per cent. of capital 47.36, of employees on salaries 20.77, of salaries 42.49, of employees on wages 32.32, of wages 46.77, and of products 62.31.

Groups of industries, number of establishments, capital, and value of products in 1910:

	Estab.	Capital	Produce
Food	6,985	\$133,344,523	\$245,669,321
Textiles	1,444	108,787,407	135,902,441
Iron and steel...	824	123,561,319	113,640,610
Timber, lumber, and re-mfrs...	4,999	259,889,715	184,630,376
Leather & mfrs.	3,999	48,788,803	62,850,412
Paper & printing	773	62,677,612	46,458,053
Beverages & liq.	260	43,237,757	28,936,782
Chemicals, etc...	178	26,926,124	27,798,833
Clay, glass, stone.	771	45,859,507	25,781,860
Metals & mfrs., exc. steel.....	341	67,133,540	73,241,796
Tobacco & mfrs.	173	21,659,935	25,329,323
Land vehicles...	465	49,397,096	69,712,114
Water vehicles...	172	10,351,765	6,575,417
Miscellaneous ...	1,011	235,148,103	104,618,560
Hand trades....	423	11,120,403	14,829,741
Total	19,218	\$1,247,583,609	\$1,165,975,639

Capital and value of products by provinces in 1910: Alberta, \$29,518,346 and \$18,788,826; British Columbia, \$123,027,521 and \$65,204,235; Manitoba, \$47,941,540 and \$53,673,809; New Brunswick, \$36,125,012 and \$35,422,302; Nova Scotia, \$79,596,341 and \$52,706,184; Ontario, \$595,394,608 and \$579,810,225; Prince Edward Island, \$2,013,365 and \$3,136,470; Quebec, \$326,946,925 and \$350,901,656; Saskatchewan, \$7,019,951 and \$6,332,132; total, \$1,247,583,609 and \$1,165,975,639.

The number of kinds of industries in 1900 was 264, with 14,650 establishments; in 1905, 274, with 15,796 establishments; and in 1910, 300, with 19,218 establishments.

COMMERCE. The following table shows imports of merchandise for home consumption, of total merchandise, of coin and bullion, and total imports, value in dollars, in years ended March 31:

	Mdse. Home Consump.	Total Mdse.	Coin and B.	Total Imports
1910	369,815,427	385,835,103	6,017,589	391,852,692
1911	451,745,108	462,041,330	10,206,210	472,247,540
1912	521,448,309	533,286,663	26,033,881	559,320,544

For the same years, exports of domestic merchandise, of total merchandise, of coin and bullion, and total exports:

	Domest. Mdse.	Total Mdse.	Coin and B.	Total Exports
1910	279,247,551	298,763,993	2,594,536	301,358,529
1911	274,316,553	290,000,210	7,196,155	297,196,365
1912	290,223,857	307,716,151	7,601,099	315,317,250

In the fiscal year 1911, dutiable imports of merchandise, \$291,818,801; free, \$170,222,529; import duties, \$73,312,368; in 1912, \$343,370,082, \$189,916,581 and \$87,576,037 respectively.

Principal imports for consumption by classes, in thousands of dollars, in the fiscal year 1912 (1911 in parentheses): Metals, minerals, and their manufactures, 123,375 (105,727), including iron and steel 96,140 (81,771); coal, coke, etc., 41,338 (32,264); cotton and manufactures, 30,983 (32,876); wool and manufactures, 26,677 (26,383); sugar, molasses, etc., 18,152 (17,481); settlers' effects, 15,145 (14,073); wood and manufactures, 20,620 (17,237); fruits, 15,314 (11,955); breadstuffs, 13,483 (10,284); drugs, chemicals, etc., 12,582 (12,178); carriages, automobiles, etc., 11,754 (7258); oils, 8912 (7869); hides and skins except furs, 8904 (8105); rubber and manufactures, 8103 (6951); silk and manufactures, 7431 (6930); tea, 6707 (5655); leather and manufactures, 6387 (5332); paper and manufactures, 6348, (5537); tobacco, 5701 (4816); spirits and wines, 5604 (4538); books, etc., 5327 (4589).

The following table shows by great classes domestic exports and total exports in the years ending March 31, 1911 and 1912 (*a* produce of mine; *b* produce of fisheries; *c* produce of forest; *d* animals and their produce; *e* agricultural produce; *f* manufactures; *g* miscellaneous; *h* total merchandise; *i* coin and bullion; *j* grand total):

	1911		1912	
	Dom. exps.	Total	Dom. exps.	Total
a	\$42,787,561	\$43,078,440	\$41,324,516	\$41,510,582
b	15,675,544	15,789,859	16,704,678	16,815,192
c	45,439,057	45,597,599	40,892,674	41,104,887
d	52,244,174	53,053,837	48,210,654	49,220,897

f	35,283,118	40,432,526	35,836,284	42,508,985
g	285,815	1,988,836	111,676	1,101,122
h	274,316,553	290,000,210	290,223,857	307,716,151
i	7,196,155	7,601,099
j	274,316,553	297,196,365	290,223,857	315,317,250

The leading export is grain, details of which (domestic exports) in thousands of bushels (*b*) and thousands of dollars (*d*) are shown below for fiscal years; also, wheat flour, in thousands of barrels (*b*) and thousands of dollars (*d*):

Years	Wheat	Oats	Barley	All grain	Wheat flour
1905-b.....	14,700	2,367	1,041	19,748	1,321
d.....	12,387	862	515	15,125	5,878
1910-b.....	49,741	3,402	2,045	56,867	3,064
d.....	52,609	1,567	1,108	56,751	14,860
1911-b.....	45,802	5,432	1,545	53,841	3,949
d.....	45,521	2,145	831	49,536	13,855
1912-b.....	64,466	8,881	2,062	76,001	3,739
d.....	62,591	3,820	1,324	68,428	16,034

Other important domestic exports, in thousands of dollars, in the fiscal year 1912 (1911 in parentheses): Lumber, 32,367 (36,136); cheese, 20,889 (20,740); silver, 15,908 (15,010); live animals, 4720 (9599); meats, 9313 (9002), of which, bacon, 7520 (8019); flaxseed, 2842 (6095); wood manufactures, 6022 (6661), of

which wood pulp, 5094 (5716); wood for pulp, 5698 (6093); copper, 5648 (5575); gold, 7193 (5344); hides and skins except furs, 5064 (4608); furs, 3842 (4278); codfish, 4271 (4389); salmon, 4312 (4092); paper, 3867 (3912); nickel, 3744 (3842); lobsters, 3648 (3265); apples, green or ripe, 5104 (1757); asbestos, 2098 (2076); coal, 4338 (6014); hay, 6374 (2723); agricultural implements, 5699 (5903).

For years ended March 31, the following table shows by principal countries imports for consumption (including merchandise and coin and bullion) and total exports:

Countries	Imports		Exports	
	1911	1912	1911	1912
United States...	284,934	356,354	119,397	120,535
Great Britain...	109,936	116,907	136,965	151,853
France	11,564	11,745	2,782	2,124
Germany	10,047	11,090	2,663	3,815
South America...	7,334	10,533	5,150	4,825
West Indies....	9,036	8,491	6,567	6,901
Belgium	3,614	3,686	2,773	3,732

Yukon (ter.)...	1,058	953	221	2,275
British prepaid postal parcels	53	100		
Total	461,951	547,482	297,196	315,317

SHIPPING. The shipping figures given below for fiscal years are exclusive of the coasting trade:

	Entered		Cleared	
	Vessels	Tons	Vessels	Tons
	Sea-going			
1901.....	13,752	7,514,732	12,953	7,328,330
1902.....	15,339	7,603,034	14,967	7,128,454
1911.....	15,235	11,919,339	14,709	10,377,847
1912.....	16,642	12,768,191	16,224	11,821,414
	On Inland Waters			
1901.....	20,814	5,720,575	20,313	5,766,171
1902.....	23,585	7,695,741	23,822	7,698,175
1911.....	23,820	13,286,102	23,668	11,846,257
1912.....	23,235	14,496,915	24,013	13,886,607

In 1912 British vessels entered from sea numbered 2409, of 6,026,767 tons; Canadian, 2845, of 1,517,879 tons; foreign, 3312, of 2,021,130 tons. Of the total entrances from sea, 9247, of 11,854,795 tons, were steam, 7395, of 913,396 tons, sail.

COMMUNICATIONS. The total single-track railway mileage in operation increased from 13,151 on June 30, 1890, to 17,657 in 1900, 20,-

487 in 1905, 24,731 in 1910, and 25,400 on June 30, 1911. The following figures are for the fiscal years 1910 and 1911 respectively: Gross earnings, \$173,956,217 and \$188,733,494; working expenses, \$120,405,440 and \$131,034,785; net earnings, \$53,550,777 and \$57,698,709. Mileage in operation by provinces in 1911: Alberta, 1494; British Columbia, 1842; Manitoba, 3406; New Brunswick, 1548; Nova Scotia, 1354; Ontario, 8322; Prince Edward Island, 269; Quebec, 3882; Saskatchewan, 3121; Yukon (ter.), 102. Capital expenditure for construction of government railways to March 31, 1911, \$261,414,695; capital expenditure for canals, to 1911, \$99,311,890. Electric railways (total computed as single track), June 30, 1911, 1587 miles. During the year nearly 400 miles of contracts were let by the Canadian Pacific Railway, and work on most of these was in active progress. These contracts include the Waybourne to Lethbridge line, of 100 miles; the Swift Current extension, 80 miles; the Waybourne to Stirling line, 25 miles, and the Sutherland line, 30 miles. Extensions were being made on the Vancouver Island system and active surveys on the western part of the main line, with the view of revising and improving the grades, were in progress. The expenditures for new work during the year were expected to amount to \$20,000,000.

Progress continued on the Grand Trunk Pacific Railway, and especially on the eastern or government section. The line from Winnipeg to Cochrane was practically completed at the end of the year, while the section from Moncton to the New Brunswick boundary was finished and rails had been laid nearly 500 miles west from that boundary. Similar progress had been made west of the Ontario boundary, where about 400 miles of rails had been laid. The eastern section also includes the new Quebec bridge, which was somewhat behind the rest of the work, and provision was made for a train ferry until its completion. It was estimated that the expenditures for construction of the eastern portion would amount to over \$25,000,000 in 1912. The western section which was being built by the company, had been constructed as far as Tête Jaune Cache by the middle of the year on its way from Prince Rupert to Hazelton. At the end of the year the branches to Moose Jaw, Brandon, Calgary, Battleford, Prince Albert, and the Alberta coal fields were either completed or nearly finished. The Grand Trunk Pacific shares a Union Station at Winnipeg with the Canadian Northern, and this structure was opened in June.

The third of the great transcontinental lines was the Canadian Northern Company, which on its route to the Pacific had over 1000 miles of construction in hand. This line crosses the Rocky Mountains at Yellowhead and then deflects from the Grand Trunk so as to reach Vancouver for its western terminal. At this place there were to be elaborate terminal arrangements, and the line was in progress eastward to meet the construction now carried on in the mountains. The Canadian Northern for its Montreal terminal will work in connection with the Canadian Northern Tunnel and Terminal Company, and use a three-mile double-track tunnel under Mount Royal, in Montreal, so as to gain access to the city and to the wharves. Construction all along the line and especially between Port Arthur and Montreal was reported

well in hand, and at the close of the year ending June 30, 1912, it was reported that 586 miles had been added to the system, giving a total average mileage for the year of 3888.

During the year the Algoma Central Railway Company's main line had reached Hobon on the Canadian Pacific, 221 miles north of Sault Ste. Marie. The Kettle Valley Railway in British Columbia was building from Cold Water westward to Hope Mountain, while progress was recorded on the Kootenay Central and on the Pacific and Great Eastern. Work on the Hudson's Bay Railway was begun from Le Pas to Spitlock and a further length had been contracted for. Port Nelson was definitely decided upon as the Hudson Bay terminus in place of Fort Churchill. In the maritime provinces the Atlantic-Quebec and Western Railway was completed.

In 1911, the government telegraphs comprised 4807 miles of line, with 603 offices; chartered companies, 33,905 miles of line and 173,546 miles of wire, with 3249 offices. Post offices in 1911, 13,324.

FINANCE. Dominion expenditure and revenue for fiscal years ending March 31 (except 1902, which ended June 30) are shown in the table below, in dollars. The various items are indicated as follows: *a* expenditure chargeable to Consolidated Fund, *b* expenditure chargeable to Capital, *c* railway subsidies, *d* other charges, *e* total disbursements; *f* revenue on account of Consolidated Fund; *g* other revenue; *h* total revenue; *i* difference between receipts and expenditures; *j* sinking funds; *k* net difference between receipts and expenditures, i. e., net excess of expenditure (except in 1912, when there was a net excess of receipts).

	1902	1910	1911	1912

Principal source of Consolidated Fund receipts in the year ended March 31, 1912: Taxes, \$105,847,804 (customs \$85,051,872, excise \$19,261,662, Chinese revenue, \$1,534,270); railways, \$11,034,166; posts, \$10,492,394; Dominion lands, \$3,775,857; interest on investments, \$1,281,317; public works, \$354,065; canals, \$263,717. Leading items of expenditure chargeable against Consolidated Fund: Collection of revenue, \$28,256,780 (including railways and canals \$12,330,463, posts \$9,172,035, customs \$2,443,846, and Dominion lands \$2,277,100); charges on public debt, \$12,706,853 (interest \$12,259,397, management \$447,457); sinking funds, \$1,156,456; subsidies to provinces, \$10,281,045; public works, \$10,344,487; militia and defense, \$7,580,600; civil government, \$4,777,678; legislation, \$2,439,807. Of the expenditure chargeable to capital (\$30,939,576), \$21,110,352 was for the National Transcontinental Railway, \$4,116,385 for various public works, \$2,560,938 for canals, and \$1,710,449 for inter-

colonial and connected railways. Net public debt at end of fiscal years: 1890, \$237,533,212; 1900, \$265,493,807; 1910, \$336,268,546; 1911, \$340,042,052; 1912, \$339,919,461. The gross public debt on March 31, 1911 and 1912, respectively, was \$474,941,487 and \$508,338,592, while total assets were \$134,899,435 and \$168,419,131.

SAVINGS BANKS. On March 31, 1912, the 1172 post office savings banks had 147,919 open accounts, with deposits and interest \$43,563,764 (average account, \$294.51). On the same date, the 18 government savings banks (of which 13 in Nova Scotia) had deposits and interest \$14,655,564. Total, \$58,219,328, against \$58,094,331 March 31, 1911.

ARMY. Every citizen of Canada between the ages of 18 and 60 is liable to military service under the provisions of the Canadian Militia act of 1904, but up to 1912 there was no necessity for compulsion and the system of cadet and volunteer training flourished so that compulsory service was quite unnecessary. The permanent force which approximates to a regular army was the chief means of instruction, while it was proposed to develop the Kingston Military College into a staff college and have associated with it military colleges in other parts of the Dominion. Progress was being made with the general scheme of reorganization determined on in the preceding years, and at the end of the year, 1912, the established strength of the Canadian active militia for 1912 was reported as follows: Officers, 5202; non-commissioned officers and men, 58,532; making a total of 63,734, with 15,471 horses. On December 31, 1912, the strength of the permanent corps was: Officers, 215; non-commissioned officers and men, 2709, making a total of 2924.

NAVY. The department of the Naval Service was created by a law which became effective May 4, 1910. Up to the end of 1912 no ships of fighting value had been acquired except the first-class cruiser *Niobe* (11,000 tons), and the second-class cruiser *Rainbow* (3600 tons). On July 29, 1911, during the gale and fog, the *Niobe* sustained damage by grounding off Cape Sable, N. S. She was repaired at Halifax. In October, 1912, a floating dock, with 27,500 tons' lifting capacity, arrived in the St. Lawrence from Barrow, to be placed at the eastern end of Montreal harbor. There are 24 small vessels for fishing protection, lighthouse and revenue service, etc. In August, 1911, the king approved of the Canadian naval forces receiving the style "The Royal Canadian Navy." See discussion of naval policy under *History* below, and **NAVAL PROGRESS.**

GOVERNMENT. The executive government and authority are vested in the king and exercised in his name by a governor-general aided by a privy council, or responsible ministry, which includes 15 heads of departments. Parliament consists of the Senate (87 members nominated for life by the governor-general) and the House of Commons. The latter body is elected by popular vote for five years unless sooner dissolved. Its membership for the period beginning 1911 was 221; under the reapportionment necessitated by the 1911 census, the next Commons will have 231 members (Quebec having a constant representation of 65). Representation by provinces: Alberta, 4 senators and 12 commoners; British Columbia, 3 and 11;

Manitoba, 4 and 15; New Brunswick, 10 and 11; Nova Scotia, 10 and 16; Ontario, 24 and 82; Prince Edward Island, 4 and 3; Quebec, 24 and 65; Saskatchewan, 4 and 15; Yukon (ter.), one commoner; total, 87 and 231. The governor-general in 1912 was Prince Arthur, Duke of Connaught and Strathearn (brother of Edward VII.), who was appointed March 6, and assumed office October 13, 1911. The ministry of Sir Wilfrid Laurier, who as a Liberal had been prime minister since 1896, was succeeded October 10, 1911, by a Conservative ministry under the premiership of Robert Laird Borden; its composition in 1912 was as follows: Prime minister, R. L. Borden; minister of trade and commerce, George Eulas Foster; interior, Dr. William James Roche; public works, Robert Rogers; railways and canals, Francis Cochrane; finance, William Thomas White; postmaster-general, Louis Philippe Pelletier; minister of marine and fisheries, and of the naval service, John Douglas Hazen; justice, Charles Joseph Doherty; militia and defense, Col. Samuel Hughes; secretary of state, Louis Coderre; minister of labor, Thomas Wilson Crothers; inland revenue and mines, Wilfred Bruno Nantel; customs, Dr. John Dowsley Reid; agriculture, Martin Burrell; ministers without portfolios, George Halsey Perley, Albert Edward Kemp, James Alexander Loughheed. Leader of the opposition in the Commons, Sir Wilfrid Laurier.

Each province has an elected legislature and an executive (lieutenant-governor) appointed by the governor-general and aided by a responsible ministry. See articles on the several provinces.

HISTORY

PARLIAMENT. Parliament was opened on January 10 and closed on April 1. Conflict between the two houses prevented the passage of several measures, the Senate insisting on certain amendments which the House of Commons would not accept. Among the measures thus held up were the highways subsidy bill and the tariff commission bill, the latter providing for a board of three commissioners to be appointed by the governor-general in council to inquire into the industrial conditions of the country. A grain act amending the law regulating storage and distribution of wheat was passed during the session. (See AGRICULTURE.) On February 27 a bill was brought in to extend the limits of Manitoba to Hudson's Strait and to transfer Ungava to Quebec; to Ontario was granted a strip of territory to admit of railway communication with Nelson River or Fort Churchill and Manitoba was to provide terminal facilities with freedom from taxation. The federal subsidy to Manitoba was increased from \$833,000 to \$1,349,346. Very early in the new administration there was evidence of a breach between the Quebec Nationalists and the Borden government. The Nationalist leaders, having used every effort in vain to force the government into establishing Roman Catholic schools in Keewatin, now began a savage attack on the ministry for refusing to extend the Quebec school system to the new territory added to Manitoba. The Nationalists argued that there was as good reason for establishing separate schools in this territory as in establishing them in the Northwest Territories

where, in 1875, before the new provinces of Alberta and Saskatchewan were created, such schools had been established. The government's attitude toward the marriage question (see below), also alienated the Nationalists. In parliamentary circles at the close of the year the chief subject of discussion was the question of naval defense. See paragraph below on *Naval Policy*.

THE MARRIAGE LAW. Early in the year, a bill concerning civil and religious marriage was introduced in Parliament. It provided that a marriage performed by a competent authority could not be invalidated by any law or canonical decree or custom of any province. Parliament submitted to the Supreme Court the questions whether such a law was within the competence of Parliament, and whether the Quebec law invalidates a marriage not contracted before a Roman Catholic priest, though otherwise legally binding. The subject came to public attention in the famous Hebert case in Quebec. A marriage celebrated by a Protestant minister in 1907 was afterwards annulled by the archbishop, in accordance with the Papal decree of *Ne Temere*, and his action was ratified by the Superior Court. On February 22, however, the decision was reversed on appeal, the judge declaring that any officer qualified to perform marriage can legally unite people of any religious faith. The question involved was whether the authority of the *Ne Temere* decree was binding in Quebec. According to this judgment the *Ne Temere* decree has no civil effect, and in general, the canon law of the Roman Catholic Church is not binding on the state. Appeal was taken from this decision to the Imperial Privy Council. The decision of the Supreme Court on the questions submitted by Parliament pronounced the latter body incompetent to pass a general marriage law for the whole Dominion, declaring the solemnization, including the form and ceremony, to be within the exclusive legislative competence of the several provinces; but that the law of Quebec does not invalidate marriages not contracted before a Roman Catholic priest. The decision of the Imperial Privy Council on July 21 confirmed the judgment of the Supreme Court, denying the competence of Parliament in the matter.

NAVAL POLICY. There was much discussion during the year of the government's naval policy, especially on the occasion of the official visit of Mr. Borden and six of his colleagues to London at the end of June. The chief purpose of the visit was to confer with the British admiralty as to the best means of cooperating with the imperial government in the defense of the empire. During the naval conference in London between the Canadian and imperial ministries there was evidence of strong popular feeling on the subject of Canadian naval policy. The public became more insistent on Canada's assumption of responsibility for naval defense. It was said that Canada was lagging behind New Zealand and Australia. It was loudly demanded that Canada should do her share. The new Conservative government decided to submit to Parliament, when it assembled in November, certain emergency proposals in regard to the navy. In October, after this determination was made known, Mr. F. D. Monk, the Nationalist member of the cabinet, resigned his portfolio of public works, having steadily insisted that before the government took action on the navy it should order a referendum. The

Conservative party came into power on the understanding, in the words of Mr. Borden, that it would "consult with the British government in order to ascertain whether or not the conditions existing were or were not so grave as to require immediate and effective aid." If necessary, aid would be given, and if Parliament would not concur, the matter would be referred to the people. As to a permanent policy, when that had been developed and explained, the subject would be referred to the people. On December 5, Mr. Borden set forth the government's policy in an address to the House of Commons at Ottawa. The main features were: The contribution of three dreadnoughts, at a cost of \$35,000,000, to be built in the United Kingdom to form a part of the battle line of the British navy, and to be directed and maintained by the British admiralty. Later, if a Canadian navy is decided upon, these vessels may be returned to Canada by the admiralty. Concerning Canada's voice in imperial naval affairs, an arrangement was proposed whereby a Canadian minister should take part in the proceedings of the British committee of imperial defense. The greater cost of construction in Canada, estimated at \$12,000,000, was the reason for having the vessels built in the United Kingdom, but the admiralty was ready to order a number of smaller vessels to be built in Canadian yards. Mr. Borden declared that the three new dreadnoughts were to be the "largest and strongest ships of war that science can build or money supply." In the course of his address he read a memorandum from the admiralty which set forth the needs of the British navy and dwelt especially on the recent German policy of naval expansion. In general the attitude of the Liberal opposition was that there was no emergency which called for this departure from the principle of a strictly Canadian navy. On the other hand, the government contended that the situation was sufficiently grave to demand immediate action.

Sir Wilfrid Laurier offered an amendment on December 12, declaring for a Canadian navy with fleets on each coast, to be manned and maintained by Canada, and for Canadian shipyards. He objected to the policy of turning over the vessels to be equipped, manned, and maintained by the British admiralty. The matter was still under discussion when Parliament adjourned, December 18, to meet on January 14, 1913. See NAVAL PROGRESS.

THE LANGUAGE QUESTION. Complaints of inefficiency and of discrimination against the English language in the bi-lingual schools of Ontario led to investigation of the subject by a government commission, which reported in the autumn that these charges were well founded. It declared that in over thirty of these schools the Roman Catholic catechism was taught in violation of the rules, that teachers lacked the requisite training, that French was used in many schools more extensively than English, and that many teachers could not speak English with any facility. Lack of funds accounted largely for these defects. New regulations were made after the publication of the report providing for more thorough teaching of English in the bi-lingual schools. They required additional inspection, the withholding of state aid if satisfactory English teaching was not provided, that teaching in English should be begun on entering school, and that

French should be used as the language of instruction only in the first form.

An important Congress of the French Language was held in the summer and one of its chief purposes was to protect the French interests as regards these schools in Ontario. It was proposed that the 3,000,000 French of North America should unite for their rights and religion. It was declared that the life and unity of the French race depended upon the preservation of their language, and their right to speak and conserve it had long been recognized as an unwritten law. They protested against "the cynically brutal" attempt to assimilate the French of Ontario. The congress passed resolutions to the effect that: (1) French people in Quebec wishing to migrate should be encouraged to settle in the west and form colonies; (2) the French of Quebec and Ontario should unite for their common interests; (3) that all pupils of French schools in America should pray for the French schools in Ontario; (4) that the French press should denounce the reduction in the schools of Ontario and the double inspection; (5) that the French of Alberta should insist on a better status for French in the bi-lingual schools there; (6) that in any bi-lingual school the language instruction should be that of the majority and that pupils should be permitted to choose the language for written examinations; (7) that in Quebec the teaching of English should be improved. In the autumn there was considerable opposition in Ontario to the new school regulations.

MISCELLANEOUS. On June 30, Regina, the capital of Saskatchewan, with a population of 17,000, was struck by a cyclone which inflicted serious loss of life and damage to property. Thirty deaths were reported and 150 persons were said to have been injured. Many buildings were completely destroyed. The damage was roughly estimated at \$6,000,000. On April 9 Canada signed a trade agreement with the West Indies and South America, to go into effect January 1, 1913. An agreement between representatives of Canada and the West Indies was signed in April, whereby mutual trade preferences were to be given and arrangements made for improving steamship and cable communication.

CANALEJAS Y MENDEZ, JOSÉ. Prime minister of Spain, assassinated November 12, 1912. He was born in 1859. His public career began at the age of eighteen, when he delivered a course of lectures at the Academy of Jurisprudence in Madrid. The following year he made addresses before political meetings in many of the larger Spanish cities, pro-

mulgating strongly liberal ideals of jurisprudence and government. At the age of 25 he was sent to the Cortes from the District of Soria and he took his seat in that body among the advanced Liberals. During the existence of the ephemeral republic which followed the resignation of King Amadeo of Savoy he served as subsecretary of the president. He had taken a prominent part in the overthrow of the monarchy and his identification with the cause of the republic gained for him an unpopularity with the crown and its representatives which it took him years to outlive. In spite of this he rose rapidly. He served as minister of finance and justice in several cabinets although he was not welcome at the Royal Palace. He formed the Radical Party which was made up largely of advocates of State socialism and this further widened the cleavage between him and the rulers of the government. It was not until 1900, however, that he became an important national figure. General Azcárraga was prime minister and headed a reactionary and clerical ministry. The Cortes was the scene of frequent hostile demonstrations against the government and this was accentuated by outbreaks in Barcelona. Canalejas urged in the Cortes that war must be waged on Clericalism. Immediately the Socialists and Republicans who had not hitherto dared openly to voice their convictions rallied around him and hailed him as the man of the hour.

In 1902 he accepted the portfolio of agriculture in the cabinet of Premier Sagasta and in this office he introduced many reforms for the working classes. This added largely to his popularity among the Liberals. He demanded that the new cabinet should meet formally and sign a document setting forth in unmistakable language the position of the ministers on all political issues of the day. He denounced the tenant system of land-holding and the concentration of lands into fewer and fewer hands. In 1904 in an oration which is memorable in Spain, he defended the Parliamentary immunity which the Conservatives were trying to have suspended in order to further their reactionary designs.

In 1905 King Alfonso, who had hitherto been hostile in his attitude toward Canalejas and looked upon him as a dangerous man, heard the latter make an address at the Academy of Jurisprudence. Upon hearing this speech the king revised his opinion, and to this change in his attitude was due largely the election of Canalejas as president of the Cortes in 1906 while the Liberals were in power and during the ministries of Morot and Lopez. From this time there began a cordial friendship between King Alfonso and Canalejas which lasted unbroken until the latter's death. King Alfonso in 1910 created a sensation when he asked Canalejas to become premier and form a ministry. It was the first time that such an advanced Radical had been elevated to the premiership. Canalejas had a difficult task in assembling a cabinet and he once resigned, but was induced to reconsider and before long secured a firm hold on the conduct of public affairs. His trouble was due chiefly to his programme for the separation of church and state and his efforts to accomplish this eventually brought about a rupture of the relations between the Vatican and the Spanish government.

He had not been premier long before a royal order was issued whereby non-Catholic religious organizations were permitted to display emblems on the walls of their churches. Next the premier, acting in full accord with the king, introduced into the Cortes a measure which aimed to reduce the number of Catholic religious orders in the country each of which was free from taxation. This greatly offended the Vatican and precipitated the final struggle. Negotiations followed between the Pope and the government and after a bitter controversy during which a bill was introduced in the Cortes forbidding the organization of any new religious organization, the Council recalled its ambassador to Rome. Canalejas was then left in control of the situation. There were many demonstrations by Catholics throughout the country and the prime minister even went so far as to suppress meetings held by them. On December 23, 1910, the entrance of any new religious organization into Spain was forbidden for two years or until the Concordat of 1851 was revised. Following this there were passed government acts which authorized religious societies without admitting the validity of perpetual vows, but prohibiting them from holding real estate except what was necessary for their actual requirements. All congregations were liable to taxation and no foreigners were permitted to organize religious bodies until they took the oath of allegiance and became Spanish citizens. Negotiations with Rome were resumed and the associations bill was submitted to the Cortes without any reference to the wishes of the Pope, on May 8, 1911.

On April 1, 1911, Canalejas resigned the premiership as the result of an attempt to revise the decision in the case of Ferrer, the anarchist philosopher who was sentenced to death for his part in the revolutionary uprising at Barcelona. He was directed by the king, however, to form a new ministry and thus remained in power.

The troubles in Morocco in 1911 brought much trouble to the premier owing to the sharp division of public opinion. As to the conduct of the campaign, the Republicans and Socialists opposed his programme. The doctrine of anti-militarism was preached throughout the country and in August, 1911, Spain suffered from a long series of strikes, involving railroads, mines and industries. Canalejas charged that the Radicals, Socialists, and Anarchists were at the bottom of the plots to bring about trouble and he again showed his fearlessness by putting down disorder. On November 12, 1912, he was shot and killed by an anarchist in the streets of Madrid. For events of 1912, see SPAIN, *History*.

Canalejas was a conspicuous figure in public life for thirty-five years and was undoubtedly one of the strongest figures in Spanish political history in modern times. He showed great wisdom and patriotism and in spite of inborn Radicalism was cautious and moderate in action. He had undertaken economic reforms in Spain which promised to lift that country to the level of most European nations. These included the building of railroads and the development of industries in all parts of the country. He was a man of wealth, but of simple habits. His leisure time was spent with his books or in hunting. In 1897 just previous

to the outbreak of the Spanish-American War he visited New York for the ostensible purpose of learning the opinion of the American people and the administration in regard to the existing situation in Cuba.

CANALS. The construction of the Panama Canal which made more than its usual progress in 1912 was naturally the most important event in the construction of artificial waterways throughout the world. This will be found treated elsewhere in the YEAR BOOK under its own title. (See PANAMA CANAL.) No other works throughout the world were comparable with this project, but at the same time important extensions and improvements were in progress. These are briefly summarized in the following paragraphs:

NEW YORK BARGE CANAL. During 1912 the progress of construction on the New York State barge canal system continued and at the end of the year the value of the work completed was approximately \$54,000,000, or more than 60 per cent. of the total construction. So great was the progress that speculation was aroused whether the barge canal could be constructed within the appropriation of \$101,000,000, the sum authorized in 1903 for the improvement of the Erie, Champlain, and Oswego canals, and that of \$7,000,000, appropriated in 1909 for the improvement of the Cayuga and Seneca Canal. Up to October 1, 1912, the work placed under contract amounted to \$77,029,116, and the work actually completed amounted to \$50,684,369. Plans were prepared during the year for the remainder of the contracts so that the entire waterway would be ready for navigation by the year 1915. In his annual report for 1912 the State engineer stated that the work could not be completed within the original appropriations and that further action should be taken by the Assembly to provide for the completion along the original lines.

In 1912 a break of considerable size occurred in the canal at Irondequoit Creek where the barge canal followed the alignment of the old canal. This break interfered with navigation for about six weeks and required the construction of a temporary trough and some modifications in the plans for the work at this point.

CAPE COD CANAL. During 1912 work actively progressed on the Cape Cod Canal between Cape Cod and Buzzards Bay which involved the construction of 8 miles of canal from shore line to shore line or of 13 miles from the 30-foot depth contour in Barnstable Bay to the same depth in Buzzards Bay. This involved the dredging of approach channels 300 feet wide in the former bay and 25 feet in width in the latter. The canal has a depth at mean low water of 25 feet and the banks where constructed through sand will have a slope of 1 to 3. In soft or exposed places the banks are to be rip-rapped from 6 feet vertically below low-water to 6 feet above high-water. There was also in course of construction a 3000-foot breakwater to protect the eastern terminus of the canal.

During the year 1912 about 2,600,000 cubic yards of material were excavated and removed. The breakwater at the Sandwich end was carried to its full length, 3000 feet from the shore, and at the end of the year was substantially completed with the exception of some dressing of the slope. During the year the placing of rip-rap on the banks to protect them from wave action of passing vessels was begun and was

completed for a length of about 1 1-2 miles at the easterly end. The re-locating of the old Colony Railroad was completed and there was but one railroad crossing on the canal and that was at Buzzards Bay. An additional highway bridge at Sagamore similar to that at Bourne was finished during the year and the various changes in the highways were adopted by the local authorities with the object of giving a continuous east and west highway on both sides of the canal. These new highways, with the exception of one small piece, were completed. At the end of the year it was estimated that a greater rate of progress than previously would be maintained and the canal completed in the year 1914.

The equipment at work on the canal and channels included 4 steam shovels and a 16-inch suction dredge inland, 2 dipper dredges in Barnstable Bay, and 3 dipper dredges in Buzzards Bay.

WELLAND CANAL. The improvement of this important waterway was in progress, and the completion of the entire project was estimated to cost some \$45,000,000 and result in a saving of eight hours' time in the trip between Port Colborne and Fort Dalhousie, as the number of locks was being reduced from 22 to 7. The depth of water in the canal was being increased from 15 to 25 feet and to 30 feet in the locks. The canal itself was being widened from 150 to 200 feet.

CANADIAN SAULT SAINTE MARIE CANAL. Progress was made during the year on the new lock for the short canal between Lake Superior and Lake Huron on the Canadian side at Sault Sainte Marie. This lock was 1715 feet in length, or 1350 feet between the inner gates, and 50 feet in width. It had a depth of 24 1-2 feet as against 18 feet in the older locks, but this increase would only be useful after the dredging of the lock channels to a depth of 21 feet, which had been maintained. The new Canadian lock was to cost almost \$10,000,000.

During the year 1912, 22,778 ships of 65,736,807 net tons register passed through the canals at Sault Sainte Marie, of which number 14,916 of 30,947,133 net tons used the United States canal and 7861 vessels of 25,789,674 tons used the Canadian canal. The total freight movement was 72,472,676 net tons, of which 32,824,815 tons were carried through the United States canal and 39,647,861 tons through the Canadian canal. These figures indicate that while more vessels used the American canal, yet a larger class of vessels carrying a greater portion of freight was using the Canadian canal.

PROPOSED GERMAN CANAL. A commission appointed to consider the construction of a canal so as to render communication between interior cities and some German port independent of Holland reported during the year. This project was considered of great commercial importance, as much of the trade of Germany has had to pass through Dutch seaports. It was proposed to start a canal at Wesel on the Rhine and extend it in a northerly direction between that river and the Netherlands frontier, joining the Ems a few miles above its mouth. The estimated cost of the project was about \$55,000,000, and in addition to the commercial advantages of the waterway it would assist in reclaiming a large area of fen land through which it would pass. An alternative proposition was to start a canal at Cologne on the Rhine and by con-

structing a channel 23 feet deep make it possible for seagoing ships to reach that city. The objections to this plan were both the great number of roads and railways to be crossed and the great cost of its execution.

CANALIZATION OF THE MAIN RIVER. Since this river was first made navigable from its junction with the Rhine and Frankfort in 1886, various improvements had been made so that by 1912 it was in regular use for boats of 1500 tons, drawing 8 feet, as far as Hanau. It was proposed to extend the canal from that city to Aschaffenburg at an estimated expense of about \$7,000,000. The river traffic since its canalization has increased annually, and the harbor facilities at Frankfort were considered quite inadequate to meet the demands of the traffic. It was decided to extend the present basin at an expense of about \$17,000,000, which includes the cost of the land required.

At Berlin two new basins were to be added to increase the extent of harbor accommodations.

IMPROVEMENT OF THE SEINE. In 1912 nothing had been accomplished to protect Paris from floods, which in previous years had occasioned great damage. It was proposed to raise the quays and facilitate the flow of water through the city by widening the narrow parts of the river and deepening it between Suresnes and Bougival, at an estimated cost of about \$7,000,000. The damage of the previous great inundation involving an expenditure of about \$400,000 had been made good, but no advance was made in the various schemes previously suggested for dredging and improving the river, both in view of flood and to increase its commercial availability.

CANARY ISLANDS. A Spanish possession made up of islands lying off the northwest coast of Africa. Santa Cruz (Teneriffe) is the seat of government and Las Palmas the leading town. Area, 2808 square miles; population, 403,908.

CANCER. Among the interesting developments of the year in cancer investigation were the experiments of Wasserman and his colleagues with the combination of selenium and eosin. Working on the principles of chemotherapy already laid down by Ehrlich, these observers obtained remarkable results in the cure of experimental tumors of mice. The problem was primarily that of finding a substance which had a greater affinity and toxicity for parasitic cells than for the normal cells of the host. Starting with the accidental observation that salts of the rare metals selenium and tellurium, when brought into contact with tumors, are taken up selectively by the tumor cells, they set out to discover how these metals might be introduced into tumors in living animals and exert their specific toxic action. A compound of selenium and eosin was finally evolved which, injected daily into mice afflicted with cancer, caused a softening of the tumor by the third day, and total absorption often by the tenth day. When the tumors were large there occurred severe, even fatal, intoxication, attributed to the rapid absorption of the products of tissue disintegration. The animals which recovered were observed for months, and in cases where the tumor totally disappeared under the influence of the injections no recurrence took place. But where the tumors were not completely destroyed

rapid recurrence was the rule. These experiments were performed with four different varieties of carcinoma and one of sarcoma, none of which is curable by any other form of treatment yet devised. Experiments with two spontaneous tumors in mice also produced complete cures. These experiments show that selenium-eosin has a definite affinity for mouse-cancer cells, being deposited about the nuclei and producing complete disintegration of the cells. The investigators take pains, however, to point out that the extreme toxicity of selenium combined with the harmful effects of rapid absorption of disintegrating tumors makes the treatment too hazardous to try upon human beings. They say that their work "merely establishes an essential scientific fact, namely, that the existing view that it may be possible to have chemical substances specifically pass out of the vessels into a tumor and destroy it, is untenable. We wish most particularly, in order to prevent false hopes and excitement among persons with tumors, to emphatically point out that at the present time we have no evidence that this substance will act in the same way with human cancers. We have not yet investigated this question. It may well seem not impossible that an essential beginning has been made and a solid foundation established, extension of which along these lines may yield progress in human therapy."

While noteworthy, Wasserman's experiments and their results must not be taken as settling firmly the parasitic theory of cancerous disease. The trend of thought based on all authoritative investigation is away from cancer infectivity. Other efforts along the same lines of investigation were made by Neuberg, Caspari, and Lohe, who worked on the hypothesis that the greater autolytic power of tumor tissue as compared with normal tissue must be due either to a direct increase of certain ferments or to a defect in protective elements, and tried to produce an active autolysis *in vitro* by the addition of colloids of a number of the heavy metals. These investigators tried to obtain salts and other compounds of heavy metals in such form as to be nontoxic for the host and yet to exercise a direct action on the tumor. They employed organic chemical compounds of a rather complex nature (the exact composition of which they refuse to divulge) of the heavy metals, such as lead, silver, arsenic, antimony, vanadium, mercury, copper, gold, etc. Cobalt and silver were found to yield the most marked effects.

The reaction following intravenous injection is described as most striking and rapid. Within a minute afterward the tumor may become hyperemic and a condition of stasis so extreme may develop that at times a serous exudate oozes from the surface. Hemorrhages may occur within the tumor, which in twenty-four hours becomes soft and fluctuating. Primary and transplanted carcinomas of mice, rat sarcomas, and an adenocarcinoma of a dog all yielded readily to the treatment and disappeared completely.

Of the many investigations dealing with the essential nature of malignant tumors those of Peyton Rous, of New York, were most significant. This investigator proved conclusively that sarcoma may be produced by injecting the fluid obtained from a tumor after it has been

freed from every trace of tumor cells. This result is interpreted as due to a living virus so small that it passes through rather coarse filters, though it is not impossible that some non-living substance produced by the cells in the animal body may be involved. At any rate, this is so far the only demonstration that a growth corresponding in every characteristic to a malignant tumor can be propagated by cell-free material, except possibly the remarkable thyroid proliferations that occur epidemically in fish hatcheries, and as to the real nature of which there is some doubt.

To this evidence in favor of the infective theory of the causation of cancer may be added that derived from the study of plant tumors by Erwin F. Smith, of the bureau of plant industry in the United States Department of Agriculture. Smith is convinced that the disease of plants known as crown-gall is in reality a plant cancer. The growth is cellular and infiltrative in character; it sends out long strands of new tissue in the course of which secondary growths may develop having the same structure as the parent growth, so that when the primary growth is in the stem secondary growths in the leaf do not have the structure of the leaf but of the stem. These growths differ from animal cancer in that discontinuous metastasis does not seem to occur, metastatic growths being connected with the primary growth by strands of new tissue, but Smith points out that since plants lack a rapid circulation discontinuous metastasis can hardly be expected. The disease is caused by a definite bacterium (*Bacterium tumefaciens*), discovered by Smith, which occurs in the cells of the growths and produces typical crown-galls when inoculated into certain plants. Smith believes that this bacterium stimulates the cells to rapid and indefinite proliferation, and that the facts discovered in regard to crown-gall or plant cancer have a direct bearing on human cancer. A similar growth in the sugar beet shows a similar analogy in structure and development to human and animal cancer.

If the view advanced by Smith is accepted, to him will belong the credit of having discovered the precise cause of a cancerous growth; but on account of the absence of complete analogy between the structure of plants and that of animals, the question whether crown-gall is a cancer or not in the ordinary sense of the word must for the present remain unsettled. See *Bulletins 213* and *255*, Bureau of Plant Industry, United States Department of Agriculture.

The electro-therapeutic treatment of cancer has received a new impetus within the past year in consequence of the visit to this country of de Keating-Hart, of Paris, and of his demonstration at the New York Skin and Cancer Hospital of the two methods evolved by him, viz., fulguration and thermo-radiotherapy. Dr. Bainbridge, who as secretary of the committee on scientific research of the Skin and Cancer Hospital has tested many proposed surgical and non-surgical methods of treating cancer, is now giving a thorough test to both of the de Keating-Hart methods. In a paper read before the American Electro-therapeutic Association in September, Bainbridge gave a preliminary report of this work, stating that while it is yet too early to make definite predictions concerning the value of the methods there is

enough of good in them to warrant the careful test to which they are being subjected by him and his staff.

FULGURATION (DE KEATING-HART). This consists in the application, from a specially constructed apparatus, of long sparks (ten to twelve centimeters) of a unipolar current, of high frequency, high tension, and relatively low amperage. After as thorough surgical removal as possible of the macroscopic evidences of cancer the wound is "bombarded" with the fulguration sparks. The application is made by means of a special electrode, in the form of a sound, consisting of a smooth, metallic mandrel, or obturator, which works snugly within an insulated tube of hard rubber. By means of bellows a current of carbon dioxid, or sterilized cooled air, is driven through the rubber tube, the purpose of this being to prevent a rise in the temperature of the column of air within the electrode and to remove coagulable liquids from the immediate field of contact. The length of the spark is controlled by the withdrawal to a greater or less degree of the metallic obturator. The electrode is kept in constant motion during the fulguration process in order to prevent burning at any given point. The dosage, or duration of application of the sparks upon a given point, may be generally stated as "ten minutes of fulguration for an area of ten square centimeters." From this it will be seen that the de Keating-Hart fulguration is distinctly not a destructive method. In this regard it is to be distinguished from the so-called "destructive fulguration," "high-frequency cauterization," "high-frequency desiccation," and other methods in which short sparks of a bipolar current of high-frequency, low tension, and relatively high amperage are employed.

The theory upon which the de Keating-Hart fulguration method has been developed is that "the *unipolar long spark of high frequency and high tension acts not upon the neoplasm but upon the soil on which the neoplasm has developed.*" In other words, it is "in no sense a destroyer of tissue, but a *modifier* of trophic nerve centres."

THERMO-RADIOTHERAPY is based upon the premise that, "other conditions being equal, the radiosensitiveness of tissues depends upon their temperature." It consists, therefore, in the application of X-rays immediately after or coincidentally with the warming of the tissues by fulguration or other means. Heat is usually applied, according to the nature and location of the tumor, (1) by the injection into the neoplasm (sarcoma) of hot physiological salt solution; (2) by irrigations with warm fluids (in cancer of rectum, vagina, stomach); (3) by passing a high-frequency current through needles thrust into the skin or through a flat electrode placed on the surface of the tumor (in tumors of woody consistency). In order to obviate the danger of X-ray dermatitis in the treatment of deep-seated tumors, the surface over the tumor is cooled by means of cracked ice wrapped in cotton, or by blowing air upon the surface which is first dampened.

Whereas it is claimed by de Keating-Hart that cancer may be cured and recurrence prevented by fulguration, thermo-radiotherapy is employed solely as a palliative measure.

CAPE COD CANAL. See CANALS.

CAPE COLONY. See **CAPE OF GOOD HOPE PROVINCE.**

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa (see **SOUTH AFRICA, UNION OF**). Capetown, the capital, had, according to the census of 1911, with suburbs, 161,579 (85,442 whites); Capetown municipality had 67,159 (29,863 whites). Kimberley and Beaconsfield, 44,433 (17,507 whites); Kimberley municipality, 29,525 (13,598); Beaconsfield municipality, 14,294 (3404); Kenilworth, 614. Port Elizabeth, 30,888; with suburbs, 37,063 (20,007 whites). East London, 20,867; with suburbs, 24,606 (14,899 whites). Grahamstown, 13,830; Paarl, 11,018; Simonstown, 4751; Vryburg, 2461; Mafeking, 2296. Of the total population, Europeans form about one-quarter and the colored races three-quarters; one-fifth of the population is urban. For area, population, production, and trade, see **SOUTH AFRICA, UNION OF**. Of the total population, 1,735,491 (859,716 males) were unable to read or write. Protestants outnumbered those of other sects, and Catholics, Mohammedans, and Jews followed in the order named; over one million were classed as of no religion. The amount of public revenue for the eleven months ending May 30, 1910, was £7,747,332; the expenditure, £7,611,298; customs revenue, £1,248,322; public debt outstanding May 30, 1910, £48,240,891. Administrator (1912), Sir N. F. de Waal.

CAPE VERDE ISLANDS. A Portuguese colony off the west coast of Africa, having a total area of 1475 square miles and a population (1909) of 147,424. Praia (São Thiago) is the capital.

CAR CONSTRUCTION. See **RAILWAYS.**

CAREY, ASA BACON. An American soldier, died April 4, 1912. He was born in Windham county, Conn., in 1835 and graduated from the United States Military Academy in 1858. In the same year he was appointed second lieutenant in the 7th Infantry. At the beginning of the Civil War he was made first lieutenant in the 13th Infantry and in the same year was appointed to be captain. He was promoted to be major and paymaster in 1867, lieutenant-colonel and deputy paymaster in 1896, colonel and assistant paymaster-general in 1898 and brigadier-general and paymaster-general in 1899. In the same year he was retired by operation of law. In 1862 he was brevetted major for gallantry and meritorious services in the campaign against the Indians in New Mexico. He received a brevet for lieutenant-colonel for services against the Navajo Indians in 1865. He was the author of *Legislative History of the Pay Department of the United States Army*.

CAREY ACT. See **IRRIGATION, and LANDS, PUBLIC.**

CARINTHIA. See **AUSTRIA-HUNGARY, Area and Population.**

CARLETON, WILL. An American poet, died December 18, 1912. He was born in Hudson, Michigan in 1845 and graduated from Hillsdale College in 1869. For several years after leaving college he engaged in newspaper work in Detroit, Chicago, Boston, and New York. Nearly his whole life was given up to the writing of poetry, chiefly in the ballad form and his writings met with a large sale. He was well known as a writer and lecturer. For several years prior to his death he was editor of *Everywhere*, a monthly magazine. Among

his best known works are: *Farm Ballads; Farm Legends; Farm Festivals; Young Folks' Rhymes; City Ballads; City Legends; City Festivals; Songs of Two Centuries; Poems for Young Americans; A Thousand Thoughts; Correct Affinities, and Ghosts, or Dreams?*

CARNEGIE, ANDREW. See **GIFTS AND BEQUESTS.**

CARNEGIE FOUNDATION. See **UNIVERSITIES AND COLLEGES.**

CARNEGIE INSTITUTE OF TECHNOLOGY. An institution for higher technical education in Pittsburgh, Pa., founded by Andrew Carnegie in 1900. Until 1912 it was known as the "Carnegie Technical Schools." In that year it was incorporated under the present title. The enrollment for 1912-13 was 2700 students from 37 States and 21 foreign countries. The institute consists of four separate schools, each with its own faculty, building, and student body. These are the School of Applied Science, School of Applied Design, School of Applied Industries, and the Margaret Morrison Carnegie School for Women. In connection with the institute is operated Camp Louise Carnegie, which is situated near Pittsburgh on the Allegheny River. This is a 750-acre engineering camp where students in certain courses are stationed for their field work. The endowment of the institute, contributed wholly by Mr. Carnegie, amounts to \$7,000,000, and about \$4,000,000 has been spent for building and equipment. Director, Arthur Arton Hamerschlag, Sc. D., LL. D.

CARNEGIE INSTITUTION OF WASHINGTON. Investigations were carried on throughout the year in all departments of research into which the work of this institution is divided. During the year many specialists were invited to become associated with each of the departments for limited periods of time. Eight such specialists were connected with the departments during 1912 by direct appointment of the executive committee.

DEPARTMENT OF BOTANICAL RESEARCH. The work of this department centres in the Desert Laboratory, Tucson, Ariz., but the work was extended through 1912 to include certain parts of the desert of Northern Africa. In the early winter of 1911-12 Dr. Cannon carried on investigations in the deserts of Algeria, and during the winter of 1911-12 Director MacDougall in the Libyan desert. Studies were continued at the Desert Laboratory, at the Carmel Laboratory on the Carmel coast, at the Salton Sea, and at various substations, where observations were made on the phenomena presented by plants under varying conditions. The desiccation of the Salton Sea, now under observation, presents many instructive conditions which are being carefully studied in their climatic, biological, and physical aspects. One of the most important investigations undertaken during the year was that of a comprehensive study of the cactus plants. In this study Professor N. L. Britton, director of the New York Botanical Garden, and Dr. J. N. Rose, of the Smithsonian Institution, coöperated.

DEPARTMENT OF EXPERIMENTAL EVOLUTION. The advances made by this department during the year were chiefly along the lines of study in cytology, in the chemistry of pigmentation, in the factors of mutation, and in the problems of human heredity. These studies were car-

ried on by the aid of experiments with plants and animals and by the aid of data concerning human traits and their transmission through successive generations. The director of the institution, Dr. Woodward, gave much of his time to studies in human heredity. In this he made use of his connection with the Eugenics Record Office, whose work was liberally supported by Mrs. E. H. Harriman and Mr. John D. Rockefeller.

DEPARTMENT OF ECONOMICS AND SOCIOLOGY. The work of this department has now reached such a stage of advancement that the time of its completion depends mainly on the amount of leisure the collaborators may obtain for consecutive attention to their several contributions to the *Economic History of the United States*.

GEOPHYSICAL LABORATORY. This department issued during the year twenty-six publications. Two of the most notable of these were *High Temperature Gas Thermometry* and *The Methods of Petrographic-Microscopic Research*. Among the more interesting of the investigations of the laboratory are those of the physics and chemistry of active volcanoes, which were carried on during the summer of 1912. Members of the staff descended into the crater of Kilauea and collected considerable quantities of gas as it emerged from the liquid lavas of the crater.

DEPARTMENT OF HISTORICAL RESEARCH. This department is chiefly concerned with the preparation of publications, and the most important issued during the year was the *Guide to the Manuscript Material Relating to American History in German State Archives*, prepared by Professor Marion D. Learned. Two other volumes, *Guide to the Materials for American History, to 1873*, in the *Public Record Office of Great Britain* and *Guide to the Materials for the History of the United States in the Principal Archives of Mexico* were in press at the end of the year. Progress was made on materials for American history in the archives of Paris. Search was also made in several other European cities for sources of American history. The work of editing the series of *Letters of Delegates to the Continental Congress* was continued during the year, as was labor on the compilation of *European Treaties Having a Bearing on United States History*.

DEPARTMENT OF MARINE BIOLOGY. Investigations were carried on chiefly by the vessel *Anton Dohrn* in the Gulf and West Indian region. During February and March, 1912, a temporary laboratory was established at Montego Bay, Jamaica, where important researches were conducted. In May the director and three collaborators visited the Bahamas, making a successful cruise of 517 miles with the *Anton Dohrn*. Many papers of interest and value were issued from this department during the year.

DEPARTMENT OF MERIDIAN ASTROMETRY. Particular attention was given in this department to studies of stellar motion, for which the extensive data accumulated by the department are furnishing evidence. Special attention was also given to the reduction of meridian observations made in 1911 in São Luis, Argentina.

NUTRITION LABORATORY. Many interesting studies were carried on by this laboratory during the year. One of the most interesting of these was that of the metabolism of a subject

who underwent a prolonged fast extending to thirty-one days, without food, and who drank only distilled water during that period. Another noteworthy investigation was that of metabolism during severe muscular work. Many important papers were published in the journals of the laboratory during 1912.

DEPARTMENT OF TERRESTRIAL MAGNETISM. Satisfactory progress was made by this department during the year in its magnetic survey of the globe. By means of the non-magnetic ship *Carnegie* it is now easier to make a magnetic survey of the ocean areas than of the land areas. On February 3, 1912, the *Carnegie* reached Manila after a circuit of the Indian Ocean. From Manila she proceeded to Suva, thence to Tahiti, and at the end of the year 1912 was en route to Coronel, Chile. Unexpectedly large errors were found in the best magnetic charts of the Indian Ocean and in some parts of the Pacific Ocean. Observations by this department were carried on simultaneously on land areas embracing portions of five continents in about twenty different countries. Many noteworthy series of transcontinental stations have been completed. The first volume of researches of the department, giving the results of land observations from the time of its establishment in 1905 to the end of the year 1910, was in press at the end of the year. The final computations of the ocean observations made during the various cruises of the *Galilee* and the *Carnegie* were well advanced for a second volume during the year. Many improvements in instrumental appliances were made in response to needs and suggestions arising from the extensive experience of the department on land and sea. One of the most important of these new appliances is that called an "earth inductor," which permits the measurement of the dip of the magnetic needle with decreased labor.

SOLAR OBSERVATORY. Effective progress was made during the year in many branches of solar and stellar research. The new tower telescope was completed and important auxiliary apparatus has been added to the equipment of the 60-inch reflector. This 150-foot tower telescope with its spectrograph and spectroheliograph was tested and found to be quite up to expectations. Two research associates, Professor Kapteyn, of Gröningen, and Professor Stormer, of Christiania, took part in the work of the observatory during the year. The total amount of the expenditures of the institution in 1912 was \$1,147,937. The total receipts amounted to \$1,240,308. At a meeting of the board of trustees held on December 13, 1912, appropriations amounting to \$1,318,773 were authorized for 1913. The president of the institution is Robert S. Woodward. The chairman of the board of trustees is John S. Billings, the vice-president is Elihu Root, and the secretary Cleveland H. Dodge.

CARNEGIE PEACE ENDOWMENT. See PEACE ENDOWMENT, CARNEGIE.

CARNIOLA. See AUSTRIA-HUNGARY, *Area and Population*.

CAROLINE ISLANDS. A German possession lying north of New Guinea and forming part of the German New Guinea Protectorate. Area (Caroline, Pelew, and Marianne or Ladrone islands, excepting Guam), about 600 square miles; population, about 55,000. Capitals, Ponapé and Yap. Imports (1910), £117,-

Copyright by Underwood and Underwood, N. Y.

DR. ALEXIS CARREL
RECIPIENT OF THE NOBEL PRIZE IN MEDICINE, 1912

1461

750; exports, £502,100; revenue (1912, with New Guinea), £78,000; expenditure, £138,000.

CARREL, ALEXIS. A French chemist, awarded in 1912 the Nobel prize in medicine. He was born in Lyons, France, in 1873 and was educated at the University of Lyons, receiving the degree of B. L. in 1890 and B. S. in 1891. His medical degree he did not receive until 1900. For some years after his graduation he was connected with the University of Illinois and while there published a monograph on cancerous goitre. This was a careful study of an affection hitherto considered rare, but shown by his investigations to be relatively frequent. He came to the United States and worked at the Hull physiological laboratory of the University of Chicago. In the latter half of 1905 two papers, written in collaboration with Dr. C. G. Guthrie, attracted wide attention from those who were watching for new lines of investigation in medicine. The first of these was entitled *Anastomosis and the Transplantation of Blood Vessels*, and *Transplantation of Veins and Organs*. These papers opened up a new field of research, and they were followed in 1906 by a paper on *Amputation of the Thigh and its Replantation* by the same men. This paper showed the possibility of having the whole series of structures in the leg grow together after complete separation. In the meantime Dr. Carrel had become attached to the Rockefeller Institute and he there continued his studies in the transplantation of veins and organs. He showed in an article entitled *The Heterotransplantation of Blood Vessels Preserved in Cold Storage*, published in 1907, that it was possible to preserve portions of veins and arteries in such condition by cold storage that the ordinary death changes did not occur in them and that they could be grafted on to arteries or veins successfully. In 1908 he published a description of the successful transplantation of kidneys from one animal to another, and in 1910-11 other papers were written and published showing further developments in the work of transplanting and repairing blood vessels. In the latter year he published a paper entitled *Cultivation in Vitro of Thyroid*. This was a demonstration of the growth of the cells of the various organs when placed upon proper nutritive media in glass or other vessels. Dr. Carrel's work in 1912 related to the preservation of life in cold storage. He demonstrated that portions of the heart of warm-blooded animals might be stimulated into activity for a long time after the death of the animal if kept under conditions in which exhausted material was removed and more nutritious material supplied. The publication of these results attracted wide attention.

CARRINGTON, HENRY BEEBEE. An American soldier, died October 26, 1912. He was born in Wallingford, Conn., in 1824, and graduated from Yale College in 1845. He studied law at the Yale Law School and practiced until 1861. He had taken great interest in military affairs and from 1857 to 1861 he was adjutant-general of Ohio. In May, 1861, he was appointed colonel of the 18th United States Infantry and in the following year was made brigadier-general of volunteers. He was commander of the District of Indiana and organized and sent to the front 120,000 volunteers from that State. It was largely through his efforts that the disloyal "Sons of Liberty" were exposed. After the war he was engaged

in active service in the West. He opened a wagon route to Montana through Wyoming in 1866, commanded the Rocky Mountain District, planned and built Fort Phil Kearney, was in active service with the Sioux Indians and was wounded in a skirmish with them. He retired from active service in 1870 on account of disability. In 1875 he was granted access by Great Britain and France to all archives pertaining to the American revolutionary war and he surveyed and mapped the important battlefields. In 1889 he made a treaty with the Flathead Indians in Montana and removed them to the western part of the State. In 1890 he took a detailed census of the "Six Nations" of New York, and the "Cherokees" of North Carolina. He wrote *Russia as a Nation*; *American Classics*; *Land of Massacre and Indian Operations on the Plains, 1866-1890*; *Battles of the American Revolution*; *Battle Maps and Charts of the American Revolution*; *The Six Nations*; *Beacon Lights of Patriotism*; *Washington, the Soldier*, and *Lafayette and American Independence*. He edited Rev. S. F. Smith's poems of *Home and Country*. He contributed many articles on educational and historical subjects to magazines, and delivered many addresses on these subjects.

CARTWRIGHT, SIR RICHARD. A Canadian statesman, died September 24, 1912. He was born in Kingston, Ontario, in 1835. He early showed an interest in politics and at the age of 28 was elected to the United Assembly of the Canadian Provinces as a member for Lenox. When the confederation came about in 1867 he was elected a member of parliament from the same place. At that time he was a Tory, in accordance with the traditions of his family, but when Sir John McDonald fell into trouble on account of the Pacific Railway scandal, Cartwright threw in his lot with the Reform party and in 1873 was made minister of finance in the cabinet formed by Alexander McKenzie. Five years later Sir John McDonald was again in power and Cartwright lost both his portfolio and his seat in parliament. At a bye-election, however, he was returned to the house as a member for Central Huron. He was in and out of parliament through the long eclipse of the Liberal party and he never slackened in the zeal of his campaign against protection. When the Liberals were successful after ten years of failure, Cartwright, after the abdication of Mr. Blake, stood second in power in the Liberal party. He was given the portfolio of trade and commerce in the new cabinet, formed by Sir Wilfrid Laurier, and in that capacity was largely responsible for the fiscal policy of Canada from 1896 until the defeat of his party at the polls in September, 1911.

CATHOLIC UNIVERSITY OF AMERICA. An institution of higher learning at Washington, D. C., under the auspices of the Roman Catholic Church, founded in 1889. The number of students enrolled in the several departments of the university in the autumn of 1912 was about 500. The members of the faculty numbered 56. There were no noteworthy changes in the faculty during the year. A chair of Old Testament was founded with a gift of \$50,000, presented by Mr. James J. Ryan, of Philadelphia. Five scholarships, amounting to \$25,000, were founded by Dr. Max Pam to combat socialism. The productive funds of the university amount to \$1,300,000

and the income to about \$108,000. The volumes in the library numbered 80,000. Rector, Thomas J. Shahan.

CATSKILL AQUEDUCT AND WATER SUPPLY. See **AQUEDUCTS**.

CAUSEWAY. See **BRIDGES**.

CAVALRY. See **MILITARY PROGRESS**.

CAYENNE. See **FRENCH GUIANA**.

CAYMAN ISLANDS. A British possession, administratively attached to Jamaica but governed locally by a commissioner (1912, G. S. S. Hirst) with headquarters at Georgetown. Three islands constitute the dependency: Grand Cayman (about 93 sq. miles; population, 1911 census, 4128), Little Cayman (4½ sq. miles, 136 inhabitants), and Cayman Brac (15½ sq. miles, 1300 inhabitants). Turtle hunting is the chief occupation of the natives; an average of 5000 yearly are exported after being fattened. Cocoanuts, cattle and ponies, and turtle shell are also exported.

CELLS. See **BOTANY; BIOLOGY**.

CELTIC PHILOLOGY. See **PHILOLOGY, MODERN**.

CEMENT. The total quantity of cement produced in the United States in 1911 was 79,547,958 barrels, valued at \$66,705,136. This included Portland, natural, and puzzolan cement. The production in 1910 was 77,785,141 barrels, valued at \$68,752,092, showing an increase for 1911 of 1,762,817 barrels and a decrease of \$2,046,956 in value. The increase in quantity was the smallest recorded in thirteen years, and the fact that the total value showed an actual decrease indicated that trade conditions in the cement industry were not as satisfactory in 1911 as in 1910. The Portland cement produced in 1911, as reported to the United States Geological Survey, amounted to 78,528,637 barrels, valued at \$66,248,817, an increase of about 2,000,000 barrels over the production of 1910 and a decrease of about \$2,000,000 in value. The average price per barrel in 1911 was slightly less than 84.4 cents, as compared with 89.1 cents in 1910.

The natural cement produced in 1911 was 926,091 barrels, valued at \$378,533, and the puzzolan cement amounted to 93,230 barrels, valued at \$77,786. In the production of Portland cement Pennsylvania by far exceeded any other State. There were, in 1911, 25 producing plants in this State, from which came 26,864,679 barrels, valued at \$19,258,253. Indiana ranks second, 7,407,830 barrels, valued at \$5,937,241; California third with 6,317,701 barrels, valued at \$8,737,150. Other States producing more than 1,000,000 barrels were Kansas, Illinois, New Jersey, Missouri, Michigan, New York, Iowa, and Ohio. For the statistics of cement production in these States see paragraph *Mineral Production* under them.

In 1911 there were 115 plants recorded as having produced Portland cement, as compared with 111 plants in 1910. The total number of rotary kilns in the producing plants was 910, as compared with 902 in 1910. There were imported, in 1911, 164,670 barrels of cement, as compared with 306,863 barrels in 1910. The imports have steadily fallen off since 1907, when 2,033,438 barrels were imported. The exports of Portland cement in 1911 were 3,135,409 barrels, valued at \$4,632,215, or, approximately, \$1.47 per barrel.

The natural cement produced in the United States comes chiefly from New York, Pennsyl-

vania, Illinois, Indiana, Ohio, Minnesota, and Kansas. A small quantity also comes from Georgia and Texas. New York and Pennsylvania produced 429,832 barrels.

Puzzolan cement is produced in Alabama, New York, Ohio, and Pennsylvania. There were only four plants producing this cement in 1911.

PORTLAND CEMENT. The use of Portland cement as a building material has grown so rapidly in recent years that its effect on the building stone and clay product industries was beginning to be felt, and in certain lines this competition, it was thought, would become even greater in the future. The following table, compiled by Edwin C. Eckel, an authority on building stones and clays, indicates the production of these materials in the decade 1900-1910.

Year	Stone	Clay products	Portland cement
1900.....	\$41,211,243	\$ 96,212,345	\$ 9,282,525
1901.....	52,071,708	110,211,587	12,532,360
1902.....	60,494,733	122,169,531	20,864,078

CEYLON (anciently *TAPROBANE*). The island of "dusky leaves" (*Támraparnú*). An island in the Indian Ocean; a British crown colony. Area, 25,332 sq. miles; population, according to the census of March 10, 1911, 4,106,350—an increase of 14.7 per cent. over that of 1901. There were 8555 Europeans, 26,857 Burghers or Eurasians, 2,714,616 Sinhalese, 1,089,354 Tamils, 266,454 Moors, 13,089 Malays, 12,198 various. More than half the people (2,479,118) are Buddhists; Hindus, 932,696; Christians, 408,984; Mohammedans, 283,582; various, 1155. Colombo, the capital, had 211,284 inhabitants; Negombo, 13,045; Moratuwa, 27,256; Kalutara, 13,005; Kandy, 29,928; Jaffna, 40,441; Galle, 39,936; Matara, 13,851.

Plantation laborers number about 530,279 (in large part Indian coolies). Acreage under cocoanuts, 942,621; rice, 680,574; other grains, 101,708; tea, 580,845; rubber, 186,634; cinnamon, 47,292; cacao, 43,358; tobacco, 16,241; coffee, 1512; cinchona, 263. There are 1986 gem quarries and pearl banks leased to an English company; the plumbago mines and pits (609) yielded (1910) about 632,275 cwts., valued (estimate) at Rs. 9,484,125.

Commercial and financial statistics appear below, in rupees:

	1908	1909	1910
Imports	130,291,908	133,782,127	164,864,703a

a Rice from India (Rs. 47,064,866), textiles and coal from the United Kingdom, etc.

b Coconut products, Rs. 38,313,348; cinnamon, Rs. 2,724,506; cacao, Rs. 2,861,760. Pounds of tea exported (no value given), 182,070,094 in 1910 (2,392,963 lbs. in 1884, 85,376,322 in 1894, 157,929,333 lbs. in 1904).

* Tonnage entered and cleared.

A large part of the trade is with British colonies. Public debt, July, 1911, £5,962,700. The railways are all owned and operated by the government; total mileage, 576½. The line from Madawachchi to Talai Mannar (about 65½ miles) at the northwestern end of Mannar Island (expected to be completed at the end of 1912) will be connected with the Indian railways by steamers landing at Danishkodi, the terminus of the Indian line. Dock and harbor improvements are in progress. Governor (1912), Col. Sir H. E. McCallum.

Tributary to the Ceylon government are the MALDIVÉ ARCHIPELAGO (a group of 17 islands, with a population roughly estimated at 30,000) and the LACCADIVE ISLANDS.

CHATHAM ISLANDS. A dependency of New Zealand (q. v.).

CHAUTAUQUA INSTITUTION. A system of popular education founded at Chautauqua, N. Y., in 1874, by John H. Vincent and Lewis Miller. The thirty-ninth annual assembly of this institution was held at Chautauqua from June 27 to August 25, 1912. The attendance was not as large as in 1911 on account of weather conditions and the withdrawal of certain railroad rates. The summer schools, however, had the largest year in the history of the institution. In the Chautauqua summer schools two appointments of great importance in the educational life of the institution were those of Prof. Shailer Mathews, dean of the Divinity School of the University of Chicago, as director of religious work and head of the School of Religious Teaching, and of Mr. Earl Barnes, of Philadelphia, as head of the School of Psychology and Pedagogy. In cooperation with Cornell University a Chautauqua School of Practical Agriculture, the first summer school of its kind in the country, was inaugurated and operated during the summer of 1912 on the institution farm of 112 acres. A number of interesting conferences were held during the summer. Four of the weeks were devoted to "Child Welfare," "Business and the Public Welfare," "Recognition Week," and "The Awakened Church." In each of these

weeks there were a number of main addresses and individual lectures and conferences dealing with the main theme. A political symposium was conducted, with addresses by Attorney-General Wickersham, the Hon. Eugene W. Chafin, and the Hon. William J. Bryan. Contributions are made only once during the summer sessions of the institution. This was called "old first night gift." In 1912 this amounted to over \$8000, \$5000 of which was devoted to the new music studio erected to the memory of the late William H. Sherwood, for twenty-two years the head of the piano department of the summer schools; \$2000 for the summer school fellowship fund, and \$1000 for permanent scholarships. The officers of the institution for 1912 were John H. Vincent, chancellor; George E. Vincent, president; Arthur E. Bestor, director; Clement Studebaker, president of trustees, and Fred W. Hyde, treasurer.

CHEMICAL COMPOUNDS, NEW. See CHEMICAL PROGRESS.

CHEMICAL SOCIETY, AMERICAN. A society for the discussion of subjects indicated by its title, founded in 1876. During 1912 the membership greatly increased and at the end of the year numbered over 6200. The only meeting of the society which was held in 1912 was in conjunction with the Eighth International Congress of Applied Chemistry in New York City, September 4-12, and all preparation of papers was dispensed with in order to assure the success of that congress. The officers of the society for 1912-13 were as follows: President, A. D. Little; secretary, Charles L. Parsons; treasurer, A. P. Hallock; editors, W. A. Noyes, *Journal of the American Chemical Society*; A. M. Patterson, *Chemical Abstracts*; M. C. Whitaker, *Journal of Industrial and Engineering Chemistry*.

CHEMICAL TARIFF. See TARIFF.

CHEMISTRY. While it is true that the science of chemistry is progressing to-day more rapidly than ever before in its history, it is also true that "remarkable discoveries" are few in number. The general trend of investigation consists in applying the new and refined methods, especially of physical chemistry, to old material. In this investigation we often find the same line of work leading on the one hand to strictly theoretical conclusions and abstractions, and on the other to most concrete industrial applications. Thus the study of the equilibrium of gases, especially at the very high temperatures of the electric furnace, and the disturbance of this equilibrium at various temperatures by different catalytic agents, is really the foundation of the successful production of synthetic ammonia from nitrogen and hydrogen, and of the manufacture of lime saltpetre from the air and limestone, now practiced on such an immense scale in Norway. These industries in turn have the most important influence upon the whole field of agriculture. Again, the study of the equilibrium between various salts and their aqueous solutions might seem purely of theoretical interest, yet this study may have important applications in pointing to possible discoveries of potash in the United States, and a consequent emancipation of the American farmer from a foreign fertilizer syndicate. See CHEMISTRY, INDUSTRIAL.

The attention of the American public has

been turned to the applications of chemistry to an unusual degree the past year, owing to the meeting in this country in September of the Eighth International Congress of Applied Chemistry, and it is a noteworthy fact that a very considerable proportion of the papers presented at that congress were on theoretical chemistry, while many of the others were on applications of theoretical chemistry to the problems of industrial chemistry. More than ever is it becoming difficult to draw a line between theoretical and applied or industrial chemistry, and many references which might equally well be considered here are passed over to the article on Industrial Chemistry. See CHEMISTRY, INDUSTRIAL.

ATOMIC WEIGHTS. The annual report of the International Committee on Atomic Weights is this year much briefer than usual and no changes have been made in the Atomic Weight Table for 1913, except that *holmium*, one of the rare-earth metals, for the first time makes its appearance. Hitherto there have been no sufficiently reliable determinations of its atomic weight to justify its admission to the table. The splitting of tellurium by Flint, by the fractional precipitation of its chloride, still remains unconfirmed, though the work has been repeated by Harcourt and Baker, and also by Pellini. Further work on the subject is promised by Flint during the present year. Nothing further has been published regarding *canadium*, the supposed new metal of the platinum group reported last year, except the suggestion that it may be identical with *amarillium*, another platinum metal reported in 1903, and long since consigned to the haven of lost elements. Hönigschmid, using several grams of radium, has found its atomic weight to be 225.95, but Ramsay and Gray, with smaller quantities, have found 226.36, which is in close agreement with previous work. The latter figure is also closer to the theoretical probability.

INERT GASES. Four years ago Ramsay published results of experiments which tended to show that when niton (radium emanation) acts on water, neon is formed. Many chemists have been inclined to assume that this neon was in reality derived from the atmosphere, and not from the niton. Now Ramsay has found that the gas given off from a solution of thorium nitrate, which had been sealed with niton in a glass tube for two years, consisted of nearly one-third neon and the balance helium. As there was scarcely a trace of argon present, the neon could not have come from the atmosphere, and it is highly probable that the neon was derived from the decomposition of the niton. Confirmatory of this is the fact that the gas from King's Well, at Bath, contains 78 times as much argon, 188 times as much neon, and 73 times as much helium as the atmosphere. This water is strongly radioactive, and it would seem that the only probable source of the neon is the decomposition of the niton. A redetermination by Ramsay of the wave-lengths of sound in relatively large quantities of neon, krypton, and xenon confirms the monatomic character of these gases. No efforts to induce the inert gases to enter into combination with other elements have thus far been attended with success, but Schrader has found that *actinium A*, *B*, and *C*, as well as the *B* and *C* decomposition products of radium and thorium, are less volatile in an oxygen

atmosphere than in hydrogen and some other gases. Russell also finds that while *radium O* volatilizes from a quartz surface in the presence of oxygen only near 1200°C., it volatilizes completely in hydrogen at 360°. Both chemists infer that this may be due to the formation of a compound with oxygen which is far less volatile than the element itself, which would be formed in a hydrogen atmosphere. Russell has also found that even at temperatures as high as 1150°C. the rate of disintegration of radium (and also of its disintegration products) is unaffected by the temperature, showing that in these reactions, if the breaking up of atoms can be considered a reaction, we are dealing with a change which is entirely outside of our control as far as heat is concerned, in spite of the fact that heat is given off by the change.

OTHER ELEMENTS. Silver mirrors are formed by the deposition of metallic silver upon glass from ammoniacal solution by the addition of such reducing agents as formaldehyde, milk-sugar, tartrates, etc. Similar mirrors are formed by electric discharge from silver cathodes in various rarified gases ("cathodic dusting"). The electric conductivity of a silver mirror is while being formed very low, and then suddenly increases, but never attains a value equal to that of ordinary metallic silver. The question of the condition in which this silver exists has been investigated by Kohlschütter, who finds that both under the microscope and the ultra-microscope this silver is amorphous and homogeneous, and that it may be considered as being in a state of colloidal division. The firmness with which the precipitated silver adheres to the glass is due to the fact that silver hydroxide is first absorbed by the glass surface and then the reducing agent is in turn absorbed. It follows, as is found in practice, that the nature of the glass and the nature of the solution both affect very materially the character of the deposit, owing to the effect of surface tension on absorption, and of electrolytes on the precipitation of colloids. A study by Brunck of the properties of metallic tantalum, now obtainable in a pure condition, has suggested its use for many laboratory purposes in the place of the now very expensive platinum. Unattacked by acid or alkaline solutions, it can be used for cathodes in electrolysis, and, with a thin plating of platinum, for anodes. Without this plating, a thin layer of non-conducting oxide, probably Ta_2O_5 , is formed. Tantalum is also suggested for weights, while tungsten is proposed by Ruder for the same purpose. Tungsten can be used for acid-proof dishes, tubes, and filtering gauze, as well as for resistance furnaces. Sir William Crookes finds that while platinum is not volatile at 900°C., at 1300°C. it loses appreciably in weight, the metal being sublimed. Under the same conditions iridium loses even more, a volatile oxide being formed. Rhodium, on the other hand, is hardly appreciably volatile.

By the action of 11-14 per cent. ozone on symmetrical butylene, C_4H_8 , Harries obtains not only the volatile monomeric ozonide $C_4H_8O_3$, and the non-volatile dimeric $(C_4H_8O_3)_2$, but also two similar products, $C_4H_8O_4$ and $(C_4H_8O_4)_2$, in which the group O_3 is present and which Harries calls "oxozonides." If, however, the ozone is first led through a solution of caustic soda and also through concentrated sulphuric

acid, only the ozonides are formed. From this he concludes that ordinary 11-14 per cent. ozone consists of about two-thirds common ozone (O_3), and one-third oxozone, the formula of which is O_4 .

ATMOSPHERE. The normal amount of carbon dioxide in the atmosphere is considered to be 3 parts in 10,000, but an analysis by Müntz and Lainé of air collected on the Charcot Antarctic Expedition shows only from 1.447 to 2.553 parts, with an average of about 2 parts. This small amount, hardly two-thirds of the normal quantity, is accounted for by the temperature of the water of the southern ocean, which is generally below 0°C ., thus reducing the dissociation temperature of the dissolved bicarbonates. This shows that, contrary to the ideas of Gay-Lussac, the movement of the atmosphere is not sufficient to cause a uniform distribution of the constituents. The composition of the higher layers of the atmosphere has been considered by Wegener, and is held by him to be very different from that of the lower strata. At the altitude of 40 kilometers half of the oxygen has disappeared, while the nitrogen has correspondingly increased. Above this the oxygen and nitrogen rapidly decrease, helium is at a maximum (4 per cent.), and hydrogen rapidly increases. Wegener considers that there is evidence of a gas much lighter than hydrogen, which he calls "geo-coronium," in the highest layers of the atmosphere. This begins to appear at about 50 kilometers, and above 200 kilometers is the chief constituent, while at 500 kilometers hydrogen has nearly disappeared, leaving geo-coronium as practically the sole constituent gas. Wegener's views are based on changes of density of the atmosphere, as shown by the suspension of the Krakatoa dust-clouds, diffuse reflection of light, and also of sound, the glow of meteors and spectra of the aurora and of meteor trails, and also the analogy of the sun's atmosphere. Geo-coronium resembles the sun's coronium and is identified with Mendeléef's speculative element of the atomic weight 0.4.

COMBUSTION OF CARBON. The question as to whether the first product in the combustion of carbon is carbon monoxide (CO), which is further oxidized to the dioxide (CO_2) if an excess of oxygen is present, or whether the dioxide is first formed and reduced to the monoxide if the carbon is in excess, has long been an unsolved problem. Perhaps the latter view is the one more commonly held, but it rests on little experimental evidence. More recently Rhead and Wheeler have approached the subject from the standpoint of determining the velocity of the various reactions between carbon and oxygen at different temperatures. They find that some CO is produced by the oxidation of carbon at low temperatures under conditions which do not admit of its being formed by reduction from CO_2 , and, on the other hand, CO_2 is undoubtedly produced at low temperatures in quantities which cannot be altogether accounted for on the supposition that CO is first formed and then oxidized to CO_2 . It thus appears that when carbon burns it is oxidized simultaneously to both CO and CO_2 , a conclusion which accounts for the results obtained by previous experimenters on both sides. When CO burns it is ordinarily considered that the reaction is merely the addition of oxygen, as $\text{CO} + \text{O} = \text{CO}_2$, but this has been several times

called in question, especially because even at high temperatures a trace at least of water appears to be necessary that the reaction may take place. Now Wieland finds that moist CO is oxidized to CO_2 by palladium black, even in the absence of oxygen. This can be accounted for by the union of CO with water to formic acid $\text{CO} + \text{H}_2\text{O} = \text{HCOOH}$; and the subsequent splitting of formic acid into CO_2 and hydrogen, $\text{HCOOH} = \text{CO}_2 + \text{H}_2$, both reactions taking place under the influence of palladium, which absorbs the hydrogen liberated. This formation of formic acid, even when CO burns at a high temperature, was confirmed by directing a CO flame against ice, when formic acid was found in the resulting water. In the ordinary combustion of carbon monoxide the hydrogen formed by the decomposition of the formic acid is at once oxidized to water, and this immediately reacts with another molecule of the carbon monoxide.

NEW COMPOUNDS. An interesting derivative of hydrazoic acid, HN_3 , has been prepared by Darzens, by the action of cyanogen bromide on the sodium salt, NaN_3 . Double decomposition readily ensues, with the formation of NCN_3 , which Darzens calls carbon pernitride, but which would be better named cyanogen trinitride. It is a colorless oil which crystallizes at 36°C ., and explodes with great violence when heated or exposed to shock. The existence of other compounds of carbon and nitrogen than cyanogen is indicated by the work of Lidoff. In numerous reactions where CO_2 is formed and nitrogen evolved, as in the oxidation of urea by sodium hypobromite, a certain quantity of nitrogen appears to be lost, and this is due, according to Lidoff, to the formation of oxidized cyanogen. The compound CNO , oxan, is formed in many reactions, but best by heating a mixture of CNBr and CNI to 160°C . with silver oxide, or by passing NO , over carbon at temperatures below 300°C . This gas unites with bases to form oxanates, as K_2CNO_2 , but in no case could oxan or any oxanates be obtained in pure condition. It seems probable that peroxan, CNO_2 , and peroxanates are also formed in some of these reactions, as well as isooxan, NCO . That a volatile compound of boron and hydrogen is formed when magnesium boride is dissolved in water, has been long known, but the quantity obtained is so small and it is so unstable that it has hitherto never been separated in a pure form and its composition has not been definitely determined. Two compounds have now been isolated by Stock from this reaction, one B_2H_{10} , and the other probably B_2H_{12} . The former boils at 16°C ., ignites in contact with the air, and is quickly decomposed by water; the other is even more unstable and boils at a higher temperature. Other hydrides of boron appear to be formed, but none of a simpler formula, which is quite unexpected, as it would be supposed from analogy that there would be a hydride of the formula BH_3 . An interesting substantiation of Franklin's theory of the ammono-salts (in which ammonia corresponds to water) is furnished by Ruff's work on the action of ammonia on titanium tetrabromide. $\text{TiBr}_4 \cdot 8\text{NH}_3$ is first formed, and on washing with liquid ammonia this is more or less ammonolysed, giving a product which contains titanium amide, $\text{Ti}(\text{NH}_2)_4$. This by the action of potassium amide, KNH_2 , is converted into a potassium ammono-titanate, KN.Ti.NH , and a new titan-

ium nitride, Ti_3N_4 . This nitride is hydrolysed by water with formation of ammonia and titanous acid, and on heating is converted into TiN , the nitride of trivalent titanium, also new. The potassium in the ammonio-titanate appears to be replaceable by chlorine, indicating the amphoteric character of the TiN_3 group. Many years ago Hadow found that when bromine was added to a solution of potassium platocyanide, which is in solid form beautifully fluorescent, but in solution colorless, a brown salt is formed with a metallic appearance. This Hadow considered to be a double salt, in which one-fifth of the molecules are oxidized to a bromo-platocyanide, the composition being $5K_2Pt(CN)_4 \cdot Pt(CN)_4 \cdot Br_2$. In recent work Levy finds Hadow's view was correct except that only one-sixth of the salt is oxidized instead of one-fifth. He also finds that the platocyanide can be oxidized by other agents and that the group $(7K_2Pt(CN)_4)$ is capable of acting as a weakly positive bivalent base. More interesting were the results obtained on oxidizing the platocyanide with hydrogen peroxide, especially when the latter was used in the form of "perhydrol." Simple and double salts of the type $M \cdot Pt(CN)_4$ were obtained. This formula may be written $MCN_4Pt(CN)_4$, and in it the platinum appears to be trivalent. This in a way confirms the work of Wöhler two years ago in preparing oxides of trivalent platinum.

THE COBALT-NITRATE TEST. The colors given when various white oxides are heated with cobalt nitrate have long been used in qualitative analysis for the recognition of these oxides, and at least the zinc-cobalt green and the aluminum-cobalt blue have had some use as pigments. While many have endeavored to determine the nature of these colored substances, and the idea that they are solid solutions is not new, Burgstaller is the first to offer what seems a satisfactory explanation of the colors. Noting that the colors in question are blue, red, or green, he considers that in the blue and red we are dealing with solid solutions which show the usual colors of cobalt in solution. In the green we have the blue solution of cobalt in a substratum of yellow zinc oxide. While at ordinary temperatures zinc oxide is white, when heated it is yellow, and Burgstaller considers that the presence of the cobalt hinders the usual transformation to the white modification on cooling.

INORGANIC ISOMERISM. Perhaps the most notable work of the year in chemistry has been the development of Werner's work on inorganic isomerism. In the review of last year some of this work was described, but in the past twelve months it has been carried considerably further. In the case of the diethylenediamin compounds of cobalt, which can be represented by the formula $(\overset{A}{B}Coen_2)_3C$, and in which *en*

is the bivalent ethylenediamin, $C_2H_4(NH_2)_2$, six isomers are possible according to Werner's theory—viz., we may have within the coördinated group the A and B, or the A and C, or the B and C, and in each of these three cases the A and B (or A and C, or B and C) may be either on opposite sides of the cobalt atom, giving the *trans* form, or on the same side, the *cis* form. In the case where A, B, and C are respectively NO_2 , Cl , and SCN , all six of these isomers have actually been prepared. When one of the groups within the complex is re-

placed by another, it by no means follows that the same position will be occupied by the replacing group as was occupied by the group it replaces. There may be a decided rearrangement, a *trans* form being converted into a *cis* form. A new theory is suggested by Werner to account for such rearrangements within the complex, as follows: The substituting group is drawn into the complex by the attraction of the central cobalt (or other) atom, but this attraction will be stronger in some directions than in others, depending on the nature and position of the groups already in the complex. The substituting group will enter the complex in that position in which the attraction is the strongest. Now since the central atom possesses only six coördination valences, one group must pass out of the complex, and this will be the one for which the central atom has the least attraction, and it may or may not be the one which was occupying the position which the entering group has taken. This theory is capable of applications outside of the "complex" compounds of inorganic chemistry, for molecular rearrangements are quite frequent in the reactions of organic chemistry, and it is quite possible that some of these at least may be accounted for by an extension of this theory. Molecular rearrangements are thus not to be considered anomalous, but represent the ordinary course of reaction.

INORGANIC OPTICAL ISOMERISM. Further work by Werner on this subject, which was first brought out in 1911, has established even more strongly the possibility of optical isomerism in the complex inorganic compounds. The preparation of numerous compounds of the types, $(\overset{A}{B}Coen)_3X$ and $(\overset{A}{A}Coen)_3X$, in both dextrorotary and levorotary forms, has been accomplished, the racemic (inactive mixture) form generally being resolved into the optical isomers by the use of bromo-camphorsulphonates, a method of familiar use in organic chemistry. Compounds have also been prepared in which the univalent groups, A and B, are replaced by a single bivalent group, such as the oxalate and carbonate radical. These show a very high rotation. Most striking is the preparation of active compounds of the type $(Coen)_3Cl$, where the central atom is surrounded by three identical bivalent groups, the coördinated group $(Coen)_3$ being in fact asymmetrical. The corresponding chromium and rhodium compounds have been formed, and the rotation of the chromium compounds, $(Cr en)_3X$, is found to be less than that of the similar cobalt compounds, while that of the rhodium isomers is about the same as that of the corresponding chromium salts, but opposite in sign. This shows that the nature of the optical activity depends upon the special nature of the central metallic atom. The levorotary form of tri-*aa*-dipyridyl ferric chloride has also been prepared by Werner. It has a very high rotation and shows that inorganic optical isomerism is not confined to ethylenediamin compounds. In all these cases of optical isomerism, however, the active complex is a cation and contains nitrogen. That these are not necessary conditions, Werner has shown by resolving salts of the blue chrom-oxalic acid into dextrorotary and levorotary forms. This was accomplished by the use of the strychnin salts. These salts show an extraordinarily

large rotation and go over rapidly into the racemic (inactive) form. Here the active complex is an anion and contains no nitrogen. It would appear that optical activity is a general property, and may be found wherever there is an asymmetrical central atom with a valence as high as four.

PEPTIDS. The field of organic chemistry is so immense that it is difficult to make selections for notice, but mention may be made of work upon the polypeptids, since these possess a peculiar interest and importance in their relation to protoplasm and to nutrition. While on the one hand albumin can be broken down into mixtures of various amino-acids, on the other hand the masterly work of Fischer and his associates has enabled the building up from amino-acids of many polypeptids, which represent in a simple form what the vastly more intricate albumin molecules must be. Naturally the subject has attracted many workers, and much progress has been made. How complicated the subject is may be judged from work of Abderhalden, who has prepared all six of the possible tripeptids which contain the three amino-acids, glycocoll, d-alanin, and l-leucin. The six are as follows:

Glycyl-d-alanyl-l-leucin,
Glycyl-l-leucyl-d-alanin,
d-Alanyl-glycyl-l-leucin,
d-Alanyl-l-leucyl-glycin,
l-Leucyl-glycyl-d-alanin,
l-Leucyl-d-alanyl-glycin.

These possess different optical rotation and different properties. When one considers that in the building up of protein substances at least 16 different amino-acids have their part, one appreciates the enormous number of structural isomers that are possible.

ARTIFICIAL SYNTHESIS OF FOOD-STUFFS. The problem of artificial synthesis of food-stuffs has attracted much attention, and Abderhalden shows that experiments indicate that a dog can be nourished for weeks exclusively on salts, water, oxygen, grape-sugar, fatty-acids, glycerol, and amino-acids, and yet gain in body weight. All of these organic substances can be prepared synthetically, so that the problem of the artificial preparation of food-stuffs may be considered as settled. The economical production of these materials is another matter. Kober and Sugiura have attacked the problem of the decomposition products of protein substances from the standpoint of the structure of their salts, especially with copper. They have studied the reaction between copper oxide and a large number of polypeptids, and distinguish three types of reaction. First, those in which a deep blue is obtained, like that of the copper ammoniates. This is given by all simple dipeptids made from mono-amino-acids. The second type is that in which a bluish-red color appears, and is given by the tripeptids of mono-amino-acids and the amides of dipeptids. This is called the semi- or partial-biuret reaction. The third type is the true biuret reaction, which gives a purple-red color and is obtained from tetrapeptids and amides of tripeptids. A peculiar interest attaches to this work from the standpoint of general chemistry, for there seems to be structurally in these compounds a coördinated grouping, and the three types are dependent on whether two, three, or four nitrogen atoms are coördinated with the copper atom,

and here again Werner's theory may be invoked for explanation.

CHEMISTRY, BUREAU OF. See **FOOD AND NUTRITION.**

CHEMISTRY, INDUSTRIAL. The announcement of the synthesis of rubber (see **RUBBER, SYNTHESIS OF**) may be considered the great distinctive event in industrial chemistry during 1912. Interest in synthetic chemistry has been largely increased not only by this discovery, but also in consequence of the president's address before the British Association, in September, in which belief was expressed that in the laboratory by means of chemical combinations life might be produced. Of remarkable interest to chemists in the United States was the gathering from all parts of the world of representatives of industrial chemistry, at the Eighth International Congress of Applied Chemistry. A summary of the more important announcements, similar to those given in recent issues of the **YEAR BOOK**, follows.

ORGANIZATIONS. The American Chemical Society, with a membership of over 6100, and now the largest body of chemists in the world, held no meetings during the year. The summer meeting was abandoned in order that the members might attend the Congress of Applied Chemistry, and the time of the winter meeting has been changed to spring. The president is Arthur D. Little, a chemical engineer in Boston, Mass. The sixth presentation of the Perkin gold medal of the associated chemical and electro-chemical societies of America was made on January 19 to Mr. Herman Frasch, for his contributions to industrial chemistry, notably those in connection with petroleum refining. The president is Dr. Leo H. Baekeland, of New York City.

The American Institute of Chemical Engineers held its summer meeting in New York, on September 5, at the same time as the Congress of Applied Chemistry, but only formal business was considered, and the papers presented were read before the congress. The annual meeting was held in Detroit, Mich., on December 4-7.

The thirty-first annual meeting of the Society of Chemical Industry was held in New York City on September 3. The council announced the membership as 4285, as compared with 4300 last year. Dr. Rudolph Messel, the retiring president, was succeeded by Prof. Marston T. Bogert, of Columbia University, who is the fourth American chemist to fill that office. Among his predecessors were C. F. Chandler (1899), W. H. Nichols (1904), and Ira Remsen (1909). The medal of the society was awarded to Sir William Crookes, for his epoch-making discoveries in physical chemistry and the rare metals.

The eighth International Congress of Applied Chemistry was opened in Washington, D. C., by William H. Nichols, president, who, after announcing that the patron, President Taft, owing to an accident, would be unable to preside, introduced Edward W. Morley, honorary president, who made the address of welcome which was responded to by representatives of foreign nations. In the afternoon a reception was given at the White House, where Mr. Taft addressed the Congress, followed by a garden party in the White House grounds. The formal opening for reading of papers took place

in New York City and continued until September 13. Most of the meetings were held in the lecture-rooms of Columbia University and those of the College of the City of New York. Papers were presented before the following sections: "Analytical Chemistry," W. F. Hillebrand;* "Inorganic Chemistry," Charles L. Parsons;* "Metallurgy and Mining," Joseph W. Richards;* "Explosives," Charles E. Munroe;* "Silicate Industries," A. S. Cushman;* "Organic Chemistry," M. T. Bogert;* "Coal Tar Colors and Dyestuffs," H. A. Metz;* "Industry and Chemistry of Sugar," W. D. Horne;* "India Rubber and Other Plastics," L. H. Baekeland;* "Fuels and Asphalt," D. T. Day;* "Fats, Fatty Oils, and Soaps," David Wesson;* "Paints, Drying Oils, and Varnishes," M. Toch;* "Starch, Cellulose, and Paper," A. D. Little;* "Fermentation," Francis Wyatt;* "Agricultural Chemistry," Frank K. Cameron;* "Hygiene," W. P. Mason;* "Pharmaceutical Chemistry," J. P. Remington;* "Bromatology," W. D. Bigelow;* "Physiological Chemistry and Pharmacology," John J. Abel;* "Photochemistry," W. D. Bancroft;* "Electrochemistry," William D. Walker;* "Physical Chemistry," W. R. Whitney;* "Law and Legislation Affecting Chemical Industry," Edward D. White;* and "Political Economy and Conservation of Natural Resources," J. A. Holmes.* In all more than 600 papers were presented, which were collected and published in 24 volumes, aggregating over 5000 pages, with illustrations, also four volumes devoted to additional papers and discussions appeared subsequent to the congress. Four international lectures were delivered by eminent members of the chemical profession from each nation represented, in the four official languages, French, German, Italian, and English. They were: "The Part Played by Infinitely Small Quantities of Chemicals in Biological Chemistry," by Gabriel Bertrand of Paris, France; "The Latest Achievements and Problems of the Chemical Industry," by C. Duisberg of Elberfeld, Germany; "The Photochemistry of the Future," by Giacomo Ciamician of Bologna, Italy, and "The Permanent Fireproofing of Cotton Goods," by W. H. Perkin of Manchester, England. Twenty-five hundred members of the congress were present at the meeting. Subsequent to the congress factory visits and excursions were made, one of which extended to the Pacific Coast, and all along the route local committees were organized to receive and entertain the guests, and to facilitate their visits to manufacturing plants. The next (the ninth) congress will be held in St. Petersburg, Russia, in 1915, over which Paul Walden of the Polytechnical School of Riga, was chosen to preside. *The Journal of Industrial and Engineering Chemistry* for October, and *Metallurgical and Chemical Engineering* for September 12, give extended summaries of the congress.

METALS. The diseases of metals previously referred to (see *YEAR BOOKS* for 1909, p. 152, and for 1911, p. 150) are now found to extend to aluminum. Sheets of aluminum that had been obtained by cold rolling and then transformed into boilers, cooking-utensils, and other hollow vessels, showed corrosions and efflorescences, discontinuous, but mostly disposed in certain directions, straight on the flat bottoms

of the vessels and curved on their sides, but always coincident with the direction of the lamination. The explanation offered was that in consequence of the formation of layers (by hammering) two neighboring layers of the plate may assume different degrees of hardness and also of electric tension, and in the presence of saline solutions these behave like two different metals in an electrolyte; the most hammered layer plays the part of a positive electrode and loses its metal. The methods proposed as remedies are first to do away with the danger caused by hammering, by a proper degree of reheating, and second to avoid contact with water.

METALLURGY. A new process for the electrolytic recovery of zinc is reported from Japan. Zinc ore is dissolved in the electrolyte, and from this liquid zinc is precipitated by electrolysis. A defect of the process heretofore has been the spongy form of the zinc which adhered to the cathode. To prevent this, carbon was tried instead of lead in the anode. The carbon was coarse and dissolved in the zinc sulphate, and the zinc which gathered on the cathode was then found to be refined to a degree rarely surpassed by the imported metal.

FUEL. Somewhat startling was the proposal made on March 24 by Sir William Ramsay at the Smoke Abatement Exhibition held in London, that coal be no longer mined, but burned in the seams as it lies, the heat being used to generate power, which then could be transmitted by means of electricity to places where it was needed for use.

He claimed that there is nothing to prevent a bore-hole from being put down until the coal-stratum is reached, and concentric tubes being used to set the coal on fire (by electricity) and to blow air down to enable the coal to burn. When sufficient heat has been engendered the amount of air sent down might be restricted. Coal with plenty of air gives off carbon dioxide. When half-burned it gives carbon monoxide, which is used for gas-engines. If steam were blown in it would give a mixture of hydrogen and carbonic oxide, or water-gas, which also is used for gas-engines. Bring the gas-engines to the mouth of the pit or bore-hole and produce the power there. You would thus have 30 per cent. of the energy of the coal available as against 15 per cent. available in fuel-engines. That energy might be transformed into electricity at the mouth of the bore-hole, and it could be distributed through the country.

In June, W. A. Bone, of Leeds University, described a process for gas heating based on the fact that hot surfaces promote the combustion of gases in contact with them. An explosive mixture of gas and air in the proportions for complete combustion is caused to burn without flame in contact with the surface of a red-hot porous solid, such as a block made of particles of fire brick and bound together by some suitable means. This process may be used for cooking purposes, also it is adaptable to the heating of furnaces, the raising of steam in multitubular boilers, the melting of metals, as for instance type metal, and other purposes. Schnabel of Germany and Lucke of New York had previously recommended similar processes.

A process for the utilization of peat, invented by F. H. Nixon, of London, consists of cutting

TO GENERATE ELECTRIC POWER**

14 10 0

the turf, after it has been air-dried, into corrugated blocks, which are sprayed with petroleum so as to form firelighters. The blocks are given a coating of highly inflammable material which strengthens them and prevents them from breaking. It is claimed that this process overcomes the obstacles associated hitherto with the combination of peat and petroleum which have been connected mainly with the employment of a briquetting machine that is not only difficult to work, but also expresses too much of the petroleum from the finished blocks.

NITROGEN. According to Sir William Ramsay, Scandinavia, Italy, Germany, Switzerland, Austria, and Russia now possess factories for preparing nitrates from the atmosphere, chiefly for purposes of agriculture, i. e., making fertilizers, but also for making explosives. A company for the manufacture of ammonium sulphate from the atmosphere by the method of the Austrian engineer, Serpek, has been formed by French and Norwegian capitalists, and the construction of a plant at Arendal, Norway, is reported.

POTASH. The limited supply of potash, controlled almost entirely by the German Potash Syndicate, has led to the search for sources of that chemical in the United States, and the discovery of a deposit at Searles Lake in the northwestern part of San Bernardino County in California, is announced by the United States Geological Survey. The importance of the deposit is due to the occurrence of the potassium salts in soluble form in a natural saturated brine, under conditions especially favorable to its separation and recovery by solar evaporation. The bed is estimated to be at least sixty feet thick, and covers eleven square miles. A conservative estimate places the amount of potassium oxide at 4,000,000 short tons, but the available tonnage may well be expected to exceed 10,000,000 tons, which would supply the country at its present rate of consumption for thirty years.

ARTIFICIAL DIAMONDS. No satisfactory method for artificially making large diamonds has as yet been found, but among the methods that seem to promise results is the following, which was published in April. It has been found that illuminating gas is decomposed on exposure to mercury vapor, and when allowed to act on metallic amalgams of mercury the carbon in the gas is liberated in an amorphous form and in crystals, or diamonds. As the diamonds thus obtained are extremely small, the inventor placed diamond dust in a tube in which gas was dissolved, to act as "mother crystals." The newly formed crystals adhere to this dust, and the result is a larger, but small, stone. The amalgam used is sodium. It is placed in a glass tube containing a small quantity of diamond dust, and illuminating gas is passed through the tube for four weeks. The brilliants which are thus manufactured appear to possess all the attributes of the genuine diamond, but they are diminutive in size.

ILLUMINATING GAS. The centennial anniversary of the introduction of the use of gas as an illuminant was celebrated in Philadelphia, Pa., on April 18 and 19. A symposium was organized under the auspices of the American Philosophical Society, the Franklin Institute, the American Chemical Society, and the American Gas Institute, at which the following addresses were presented: "By-Products in Gas

Manufacture," by Charles E. Munroe; "The Commercial and Financial Aspects of the Gas Industry," by George B. Cortelyou; "The Technic of Gas Manufacture," by Alfred E. Forstell; "Gas as an Illuminant," by Van Rensselaer Lansingh; and "The Use of Gas for Heat and Power," by Edward B. Rosa. A limited edition of these addresses has been issued in book form. A loan exhibition of articles, models, appliances, books, and pictures having an historical interest, was held at the same time in the hall of the Franklin Institute.

FIBRES. The demand for artificial silk is on the increase. The raw material used in its production is cotton. Its chemical nature does not change after manufacture, and, except for some additional process to render it brilliant or incombustible, it is still nothing but cotton. Therefore, the only difference between artificial silk and cotton fabrics lies in the weaving process, mechanical for cotton stuffs, chemical for artificial silk stuffs. Three processes are in general use, the Chardonnet, the viscose, and the one called vegetable casein (*caséine végétale*). Of these the viscose process seems to be the most desirable, as it is the cheapest. Recently patents have been taken out for an artificial silk, the base of which is spun glass—spun at one-eighteenth of a hair's diameter. This almost imperceptible filament, to which are added certain chemical products producing brilliancy and suppleness, is stronger and more solid than any of the other artificial silks. It can be twisted, braided, or woven with extraordinary facility, and constitutes a real advance in that industry, the product of which the Germans call "glanstoff" and the French "artificial silk." It is unflammable, unaffected by humidity, and indestructible by acids or by alcohol. Two new fibres are on trial, the first being paper yarns made from pine fibres, which are very cheap. The pine fibre has to be made into paper before spinning, and it is not intended to supplant either cotton or wool for the finer yarns. It forms a strong, coarse yarn, which can be readily dyed any shade and will take on also a high polish, while it is moth and insect proof, and not subject to mildew. The second fibre is obtained by dredging in the shallow seas of the Spencer Gulf, South Australia, where it is found embedded in sand, from which it is separated by washing. From a chemical and microscopical examination the fibre appears to be a land plant which has been submerged by an incursion of the sea, thereby undergoing a process of natural retting. While the fibre is rather brittle and deficient in tensile strength, it is possible to use it in conjunction with wool or shoddy. As it comes to market it is particularly rich in sodium and magnesium chlorides, and yields a large amount of mineral residue on burning, it has properties which should render it unflammable. The dyeing affinities of the fibre are peculiar. It has a strong attraction for basic colors, which dye it without a mordant, thus making it very similar to jute, while it evinces only a slight attraction for the substantial cotton colors and for those of the sulphur group.

A metallic yarn new this year, consists of a core of any suitable substance coated chemically with a metallic layer. The layer is strongly adherent, and the metal particles are protected from oxidation and the action of gas. It can be produced in all shades of gold,

and also in silver and copper in any of the modern art shades. Having a smooth surface, it is admirably adapted for working in with other threads, and in combination with artificial silk it can be woven into tissues sparkling with the iridescence of the rainbow. The newest substitute for wool is the banana fibre. This material is much like jute and hemp. The Chinese were the first to use it, and the supply available is almost without limit. One feature of the cloth produced from this fibre is that it is suitable for use in tropical climates. A new jute substitute made from paper yarn and cotton waste by a German firm, is in demand. The new substitute, called "textilose," offers many advantages over jute for packing dry, powery substances such as cement. The nature of the material prevents any dust escaping from the bag. A chemical process, somewhat similar to the mercerization of cotton, is being successfully applied in Barmen to spun worsted yarns. The yarn is run into a bath of sodium bisulphite, a chemical which exerts a shrinking action upon wool. This action is resisted by mechanical tension, and the process is continued for some five minutes at a high temperature, until the wool assumes a gelatinous or rubber-like elasticity. The yarn is removed to a weak mineral acid solution, boiled under relaxing tension for an hour, and is finally rinsed and dried. Norgine, a new product made from kelp, is used in the textile industry for stiffening and dressing purposes, and gives very satisfactory results. It is not used as a substitute for potato starch, dextrine, etc.; only as an admixture in starch to give the goods a softer and more flexible feel. Norgine is therefore considered as a ligament or agglutinant. The seaweed from which it is made comes from Sweden. A by-product of norgine is iodine.

PAPER. As sources for paper pulp the kaoliang or tall millet, so extensively grown in Manchuria, is recommended, and a series of experiments made in Dalny show that 77 per cent. of the raw material is available for that purpose. A pulp factory is proposed near Naples, Italy, to utilize esparto grass or alfa from Tripoli. Following the reference to bamboo as a paper stock (see YEAR BOOK, 1911, p. 166) the government of Burma will grant unusual concessions to those who desire to establish paper mills, and will use that material for pulp. Bamboo paper napkins are reported from Hongkong. The bark from hemlock, formerly of no value, is now used in the north-western States for making tanning extract. A new paper cloth invented in Germany is described as follows: A thin sheet of pulp having been deposited on a felt, a piece of cotton or linen cloth of the same size is laid thereon, and this again is covered by a second sheet of pulp, with which the cloth mixes so intimately that the whole forms one solid and compact sheet. The process is inexpensive, while the applicability of paper cloth thus made to a variety of purposes is obvious. It is called "sandwich paper."

GLASS. A new form of glass called "siloxyd glass," recommended as an improvement over quartz glass, is made by adding to raw quartz solutions of oxides of zircon, titanium, and other metals difficult to fuse, or silicates of same to silicic acid, the resulting mixture yielding on fusion a transparent glassy substance which fuses at 1750°C. The advantages claimed

for this material over ordinary quartz glass are that its strength is 30 to 50 per cent. greater tested by bending, and 10 to 30 per cent. more tested by pressure, and that it is less brittle, because the devitrification is only about half that of quartz glass. It is also more resistant to basic metallic oxides. The advantages claimed for siloxyd glass give to this material a wide range of usefulness, especially for apparatus used in the acid industry and for laboratory purposes where socket pipes, tee pipes for acid conduits, evaporating basins, concentrating dishes, cooling vessels, special boxes, conical pipes, condensation utensils, balls for acid towers, etc., are required. Most of the articles used for such purposes have been made of platinum, as no quality of glass that would meet the requirements had been produced.

An unsmashable glass called "triplex" glass has been invented in France. It is made as follows: Two sheets of glass are taken and one face of each is covered with a thin layer of gelatin; the sheets, gelatin faces opposite, are placed together, with a very thin sheet of celluloid between. The whole is subjected to hydraulic pressure to make the combination solid. The composite sheet as it comes from the press is as transparent as ordinary glass. When struck, as by a hammer or spike, it may be cracked, but it cannot be broken into bits. The glass is pulverized at the point of shock and in its neighborhood, involving a great absorption of energy. This glass may be of great service in carriages, automobiles, public conveyances, and railways, for besides the direct shock the return shock often determines the breakage of glass in most accidents, and most serious wounds are due to broken glass.

COLOR PHOTOGRAPHY. The reproduction of actual colors in a photograph has, until recently, been attended with difficulty, owing to the lack of sensitiveness in autochrome plates in comparison with ordinary plates. Efforts to strengthen the sensitiveness of the autochrome plate have been made in two ways: First, by substituting for natural light an artificial light strong enough to reduce the time of exposure to a fraction of a second; second, by hypersensitizing the plate through the use of certain coloring agents of the cyanide group. For the first method flash powders are employed, notably a mixture of two parts of magnesium and one part of potassium perchlorate. The substitution of this powder for daylight has marked a new step in the production of a photograph in color. The results are as favorable as those obtained in daylight, and the time of exposure can be regulated to a fraction of a second. In using this process the light entering the camera must be filtered through a screen different from that ordinarily employed in autochrome photography, and without it the colors reproduced would not be true to nature. The second method of overcoming lack of sensitiveness consists in hypersensitizing the plates themselves by impregnating them with cyanide coloring agents known by the names of pinachrome, pinacyanol, and pinaverdol. Until recently autochrome plates after sensitizing required the use of still another different taking screen, but with the solution now used for this process the magnesium screen may be employed. After sensitizing the plate, it must be dried very quickly, as slight delay in the drying will in-

THE WILLIAM RAINEY HARPER MEMORIAL LIBRARY
UNIVERSITY OF CHICAGO

jure the colors. The plate is placed vertically to dry in an air-tight container sealed against light, and holding a receiver containing sulphuric acid or calcium chloride.

PERFUMERY. Peter M. Short, an English chemist, has succeeded in manufacturing from petroleum an essence which is said to be a perfect substitute for attar of roses. While experimenting with liquid air to produce a candle from paraffin by freezing, he found that certain free agents remained floating at the top. These he investigated and found a substance which imitates attar of roses.

MISCELLANEOUS. A new oil has made its appearance in Europe that is extracted from tomato seeds. Especially in Italy is it possible to obtain this oil in considerable quantities, owing to the extensive cultivation of the tomato there. From a chemical standard the tomato-seed oil is classed as a dry-seed oil of the type of cottonseed oil. It will find, therefore, an immediate employment in soap-making and in all industries where cottonseed or similar oils are used.

New sources for the supplying of wood oil to paint manufacturers are notable in the oil obtainable from the kukui nut (*Aleurites moluccana*, or candlenut) which grows abundantly in Hawaii and the Philippines. These nuts yield an oil having the same properties as wood oil. If the nuts can be gathered and the oil extracted profitably, this oil should compete in the American market with Chinese wood oil.

The production of gas from peat having a low water content (up to about 20 per cent.) for use in suction gas (sauggas) engines has already met with considerable success in Germany, but recently successful efforts have been made to utilize peat with a water content 50 to 60 per cent. and thus do away with the process of drying.

A substitute for wood from straw is made in Europe, as follows: The straw waste is first split longitudinally, by a special cutting device to destroy the resiliency in the stalk. The ripped material is then placed in the machine together with certain ingredients, being laid upon a traveling plate. The latter is kept at a uniform temperature by means of steam, so as to cook the straw and the associated substances. When this stage has been carried to the requisite degree intense pressure is applied, the results of which are to compress the fibres of straw closely and tightly together, forming a homogeneous mass. A pressure of between two and three tons to the square inch is required in order to produce the best results, and the fabric issues from the machine in continuous lengths of the required thickness and width to be sawn as desired.

W. H. Warren and M. R. Grose, of Worcester, Mass., describe a new baking powder prepared from maple-sugar "sand," a waste product in the production of maple syrup. It has the following composition: Calcium bimalate, 57 parts; sodium bicarbonate, 25 parts; starch, 18 parts.

A substitute fertilizer called "phonolith" is now being manufactured in Germany. Its composition is: Water, 2 per cent.; silicic acid, 50 per cent.; oxide of iron, 7 per cent.; clay, 18 per cent.; lime, 4 to 5 per cent.; magnesia, 1 per cent.; potash, 8 to 10 per cent., and soda, 6 to 8 per cent.

LITERATURE. *The Chemical World*, a month-

ly *Journal of Chemistry and Chemical Engineering*, began publication in London, England, with the issue for January, 1912.

CHESS. A. K. Rubenstein, the Russian champion, captured the highest honors in chess in 1912 by winning the international matches held at San Sebastian, Wilna, and Poestyen, and tying O. S. Duras, of Prague, in the Breslau match. This showing makes it probable that some time this year Rubenstein will be pitted against Dr. Emanuel Lasker, the world's champion. Other international winners were Alexander A. Alechine, of St. Petersburg, at Stockholm, and Rudolph Spielmann, of Munich, at Abbazia, where the play was restricted to "king's gambit." No important tournaments were held in the United States, although the *American Chess Bulletin* arranged a king's gambit correspondence tournament, open to players of the United States and Canada. The tournament began in November, 1912, and will end in May, 1913. Columbia for the second successive year won the intercollegiate tournament, capturing 10½ games and losing 1½. Harvard finished second, with 8½ to 3½. Princeton won 3 games and lost 9, and Yale won 2 and lost 10. The Triangular College League tournament resulted in a tie between Cornell and Pennsylvania. Brown, the other contestant, failed to win a game.

CHICAGO, UNIVERSITY OF. An institution of higher learning at Chicago, Ill., founded in 1892. The total number of students enrolled in all departments of the university in the autumn of 1912 was 3362. The faculty numbered 337. The total benefactions received during the year amounted to \$1,087,178. Among these was a gift by Mr. Julius Rosenwald of \$250,000 toward the building fund of the university. Mr. Rosenwald so conditioned the gift as to necessitate the securing of \$500,000 from other friends of the university. The productive funds of the university in 1911-12 amounted to \$17,226,573. There were in the library 371,351 books and 195,000 pamphlets. President, Harry Pratt Judson.

CHILD LABOR. NATIONAL CONFERENCE. The eighth annual conference of the National Child Labor Committee was held in Louisville, Ky., in February. The general subject was "Child Labor and Education." A number of educators were present by special invitation. The main features of the present programme of child labor reform, as night work in glass factories, employment of small children in fruit, vegetable, fish, and oyster canneries, night messenger service, and regulation of street trades, were touched upon, but special attention was given to industrial training and vocational guidance. Evening schools for young children who work from eight to 12 hours during the day were unanimously condemned as cruel and inhuman. Continuation schools for children from 14 to 16, even to 21, years were variously advocated as a means of raising the industrial

efficiency of the next generation. One speaker held that the high schools and even the eighth grade have little or no economical value today, as pupils go out from them into automatic work with no real preparation for life. Mrs. Florence Kelley advocated compulsory half-time schools for minors above 16 years.

In the discussion of vocational guidance it was brought out that there are 42,000 children licensed each year in New York City, most of whom earn less than the cost of their own support and yet work in "blind-alley" trades where they receive no training for the future. It was emphasized that there is great danger that vocational guides may become too explicit in their directions instead of supplying information as to conditions and opportunities. It was also pointed out as possible evils that employment bureaus may be formed by schools only to degenerate into agencies for finding jobs; that encouragement might be given to short cuts in industrial training, and that attention of the child may be directed toward industry too early. Miss Helen T. Woolley gave an account of a study under her direction at Cincinnati, which is to continue over five years, of two groups of children, one in industry and the other in school. The hope was expressed that vocational guidance would result in changing the character of the school curriculum so that children would wish to stay and parents would wish to have them stay in school to the end. One speaker held that a desirable result would be the conviction that most industries are not suited for children under any condition. Dr. Samuel M. Lindsay declared that federal aid to education is a necessary step in the solution of the child-labor problem. He declared that 20 per cent. of the white voting population in some States is illiterate; that many of the poorer sections of the country cannot meet the increased demands for vocational training, and therefore outside aid for the better equipment and of school houses and educational opportunities is imperative. The rejuvenation of the rural school was advocated as a necessary step in raising the status of rural child labor and checking the movement of country youth to the city and the mill community. The importance of industrial training and the great social cost of child labor led to a resolution calling upon the educators of the country to revolutionize school methods and curriculums so as to raise the standards of attendance and also provide practical vocational opportunities for all. In emphasizing the social cost of child labor several of the speakers emphasized the deterioration of the factory population of England, as shown by the reductions in the standards for army recruits in 1885 and again in the British-Boer War. The extension of medical inspection of schools to mills was advocated. One remedy for the exploitation of children, advocated by Rev. John A. Ryan, was the legal minimum wage (q. v.). He declared that many children are exploited through the fact that their wage does not compensate for energy expended, with the result that growth and intelligence are stunted and vitality diminished. The United States commissioner of education, P. P. Claxton, proposed as a substitute for child labor that the children of the mill communities be given agricultural training. This would raise the wages of the adult workers in the mills

and enormously increase the welfare not only of children but of mill communities in general.

ANNUAL REPORT. The report of the general secretary of the National Child Labor Committee showed that during the year 1912 investigations had been conducted into the administration of child labor laws in twelve States; into textile mills in four States; into canneries in two States; into truck gardens and berry-fields in two States; into the night-messenger service in Pennsylvania and the District of Columbia; into the employment of children on the stage in two States and the District of Columbia; into tenement home work in Massachusetts and New York; into coal mines of Pennsylvania, and into the street trades in Michigan, Ohio, and District of Columbia. Special attention had been given to tenement home work in New York City. In addition to the forty-one articles for the making of which in tenements licenses may be had, the inspectors of the committee found the following kinds of work and articles: Crocheting of twelve different commodities; dolls' cloths of many varieties; teddy-bear legs; play suits for children; beading moccasins and bags; embroideries of all kinds; ribbon rosettes; roses and fancy bows; passementeries; Irish crochet, including lace, collars, cuffs, buttons, and medallions; millinery ornaments; braiding hat straws; glove stitching; coil winding; making lamp shades, brushes, belts, garters, suspenders, bead necklaces, kimonos, and hatpins. The prohibition of tenement manufacturing and the creation of minimum wage boards were recommended.

LEGISLATION. The fight for advancing child labor legislation has largely taken the form in recent years of efforts to secure the passage of a model or uniform law. This law has been agreed to by the National Child Labor Committee, the American Bar Association, and the United States Commission on Uniform Laws. It prohibits the employment of children under 14, forbids night work and dangerous occupations for children under 16, and requires educational and medical certification. It forbids the employment of children under 18, and in some cases under 21, in trades considered exceptionally dangerous. It prohibits the employment of girls under 21 in coal mines or quarries, and the employment of minors in saloons, barrooms, or night-messenger service. It forbids street-trading to boys under 10 and girls under 16, and otherwise regulates the street trades. The hours of employment are limited to 8 per day and 48 per week, between 7 A. M. and 7 P. M. for boys under 16 and girls under 18.

In 1912 new laws were enacted in twelve States. Arizona adopted the model law above outlined. Kentucky limited to 60 hours per week the employment of women under 21 in all gainful occupations, except domestic service and nursing; two additional factory inspectors, both women, were authorized. Louisiana exempted stage children from the child labor law. The Maryland law approximated the model law, but permitted children of 12 to be employed in canneries, stores, places of amusement, and the transmission of merchandise and messages. At the same time a compulsory school attendance law was passed and the factory inspection department reorganized. Massachusetts established a 56-hour week for

women and children in mercantile workshops; established a minimum wage commission, and appointed a commission of three to investigate the condition of widowed mothers having dependent children. Minnesota thoroughly revised her child labor law, following closely the model law. Boys under 18 were forbidden employment as night messengers between 10 P. M. and 5 A. M.; such employment was totally prohibited for girls under 21; and exemption of stage children under official authorization was established. A vigorous campaign was carried on by the commission in Mississippi, through the distribution of reports and a weekly press service. A law was finally secured following closely the model law, though exempting canneries in the country but not those on the coast. Mississippi became the first State in which cotton manufacturing is a principal industry in which children under 16 have a legal 8-hour day in such mills. This law prohibited the night work of boys under 16 and of girls under 18. New Jersey limited the employment of all females to 10 hours a day in manufacturing or mercantile establishments, bakeries, laundries, and restaurants. New York established a 54-hour week for women and children employed in all manufacturing industries, except canneries, and perfected official supervision of children seeking employment certificates. Rhode Island prohibited the employment of boys under 21 in messenger service between 10 P. M. and 5 A. M. South Carolina forbade the employment of children under 18 at night or under 14 during the day as messengers in cities of 5000 population and over. Virginia limited the hours of all females and boys under 14 to ten per day in mercantile establishments in towns of 2000 or more.

NEW YORK. The New York Factory Investigating Commission appointed to inquire into the conditions of labor and other aspects of modern factory life studied among other things the conditions of child labor in the New York canneries and city tenements. For a number of years efforts have been made to bring the canneries under some form of effective public control. An apparently successful effort a few years ago was defeated by official decisions declaring sheds attached to the canneries not to be factories within the meaning of the law, since no machinery was installed in them. The experts of the Investigating Commission found numbers of children, some as young as 3 or 4 years, 102 were 8 or under, and nearly 1000 under 14, employed in these sheds in stringing beans, husking corn, and otherwise assisting in the preparing of fruit and vegetables for canning, without any restrictions as to hours. Women were shown to have worked as many as 115 to 120 hours in one week. They described in a most realistic manner the hardships of such children and the social loss involved in allowing them to grow up in ignorance and without definite vocational training. There was thus secured the widest publicity for abuses which the reformers have long sought to remedy. The inquiry brought out the fact that more than half the cannery employees no children at all and that a few of them made good profits without working women excessive hours. Thus restrictive legislation in behalf of the workers would protect them and the more conscientious employers at the same time. Much concrete evidence bear-

ing on the employment of children in home work in New York City was being gathered at the close of the year.

ENGLAND. The London County Council promulgated the following rules for the regulation of street trades. No child under 14 who is liable for full time school attendance may be employed on school days more than 3½ hours in any one day, nor between 8 A. M. and 5 P. M., nor before 6:30 A. M. or after 8:30 P. M.; on other than school days such may not be employed more than 8 hours in any one day nor before 6:30 A. M. or after 9 P. M. No girl under 16 shall be employed in any street trade. No boy under 16 may be thus employed, except between the hours of 6 A. M. and 9 P. M., and all such must be exempt from school attendance and procure and wear a badge constituting a license. An elaborate set of rules was formulated to govern the issue and withdrawal of badges and the punishments for altering, lending, selling, or pawning same.

SCOTLAND. A council on child welfare was formed through a federation of public, religious, and philanthropic agencies and individuals interested in the promotion of the welfare of children. Its organization consists of a central committee operating through local councils and executive committees. It will aim to provide means for perfecting child life in all aspects up to the age of 21. Much attention will be given to the collection and dissemination of information. It will arrange conferences and coöperate in every way with existing agencies.

See CHILDREN'S BUREAU; WIDOWS' PENSIONS; WOMEN IN INDUSTRY; MINIMUM WAGE; SWEATING.

LITERATURE. Among the new books of the year were. E. N. Clopper, *Child Labor in City Streets*; Arthur Holmes, *The Conservation of the Child*; William F. Ogburn, *Progress and Uniformity in Child Labor Legislation*; Dunlop and Denmon, *English Apprenticeship and Child Labor: A History*; Report of the Commission on Minimum Wage Boards, by the Massachusetts Commission; D. H. Whitehouse, *Problems of Boy Life*; S. P. Breckinridge and E. Abbott, *The Delinquent Child and the Home*. The National Child Labor Committee began in June the publication of a quarterly, *The Child Labor Bulletin*.

CHILDREN, ILLITERACY OF. See ILLITERACY.

CHILDREN'S BUREAU. On April 2, the House of Representatives passed the Peters bill authorizing the establishment of a federal children's bureau in the Department of Commerce and Labor, this bill having previously passed the Senate. Shortly thereafter President Taft named Miss Julia C. Lathrop of Chicago as the chief of the new bureau. During the five preceding years the National Child Labor Committee had carried on an agitation for the creation of such a bureau, the idea having originated with Miss Lillian D. Wald of New York City. It was opposed on constitutional grounds and as an unauthorized invasion of the rights of the States. The law specifies that "the said bureau shall investigate and report upon all matters pertaining to the welfare of children and child life, and shall especially investigate the questions of infant mortality, the birthrate, physical degeneracy, orphanage, juvenile delinquency and

juvenile courts, desertion and illegitimacy, dangerous occupations, accidents and diseases of the children of the working-class, employment, legislation affecting the children in the several States and Territories, and such other facts as have a bearing upon the welfare, efficiency, character, and training of children." On many of the subjects here indicated information is almost if not quite wholly lacking; what is at hand is in a chaotic condition, and almost all the various activities for child welfare lack coordination. Having no administrative powers, the main function of the bureau will be to secure information and make it available to the States and all parties interested. The first pamphlet of the bureau stated that the first work would consist in the compilation of existing material and the publication of a statistical handbook. The bureau will collate material from the current literature of all countries; will prepare digests of legislation; will make an original investigation of infant mortality; will aid in securing registration of births, and will issue popular pamphlets on the subjects within its scope.

The first subject taken up by the new bureau was an investigation of infant mortality or the death of children under 1 year of age. Preliminary work had been completed by December 20. The plan was very comprehensive, including housing, feeding, care of infants, milk supply, industrial and economic condition of parents, sanitary conditions of the neighborhood, and other factors in the hygienic environment. The investigation was to begin in smaller towns surrounding the larger cities of New England, Pennsylvania, and Michigan, these being the only States where birth registration is complete. Statistics presented by Dr. Cressy L. Wilbur showed that deaths of babies under 1 year of age in the poorer districts of a principal American city were 373 per 1000; on the other hand, in the better residence quarters the death rate was 156. Estimating that 300,000 babies die annually in the United States, these figures warranted the conclusion that, could good conditions be provided for all, at least 150,000 babies would be saved annually. It was thought that even more than this number could be saved, since the infant death rate in New Zealand is only 68 per 1000. See **CHILD LABOR**.

CHILD WELFARE. See **EDUCATION**.

CHILE. A republic on the Pacific coast of South America. Capital, Santiago.

AREA AND POPULATION. Chile has an estimated area of 757,366 square kilometers (292,419 square miles), including Tacna province (23,958 sq. kms., 9250 sq. miles), claimed by Peru. The census of November 27, 1907, disclosed 3,249,279 inhabitants (Tacna, 28,748). In 1912 figures were published showing the population by provinces, as officially calculated for December 31, 1910. The total was 3,415,060, distributed as follows (in parentheses are shown the provincial areas in square kilometers): Aconcagua, 132,730 (14,000); Antofagasta, 118,718 (120,718); Arauco, 62,259 (5668); Atacama, 65,118 (79,531); Biobío, 100,495 (13,863); Cautín, 161,935 (16,524); Chiloé, 91,657 (22,255); Colchagua, 159,421 (9973); Concepción, 225,054 (8579); Coquimbo, 178,731 (36,509); Curicó, 108,120

(7885); Linares, 111,773 (10,279); Llanquihue, 113,285 (91,676); Magallanes (ter.), 23,650 (171,438); Malleco, 113,020 (8555); Maule, 115,568 (7281); Ñuble, 169,858 (9059); O'Higgins, 94,257 (5617); Santiago, 546,599 (15,260); Tacna, 42,925 (23,958); Talca, 132,730 (10,006); Tarapacá, 115,940 (46,957); Valdivia, 131,751 (23,285); Valparaíso, 299,466 (23,285); total, 3,415,060 (757,366). Population of the larger cities (1907 census): Santiago, 332,724; Valparaíso, 162,447; Concepción, 55,330; Iquique, 40,171; Talca, 38,040; Chillán, 34,269; Antofagasta, 32,496; Viña del Mar, 26,262. Immigration is small (2543 in 1910). In 1910, marriages 19,326, births 130,052, stillbirths 3471, deaths 106,073; excess of births 23,979.

EDUCATION. Primary instruction is gratuitous, but not compulsory. Public primary schools at the end of 1911 numbered 2896, with 375,274 pupils enrolled and an average attendance of 58.76 per cent. Private schools receiving state aid had an enrollment of 52,315, with average attendance 32,683. In 1910 private schools without state assistance had 30,385 pupils enrolled. In 1911: 41 lyceums for boys, enrollment 12,052, average attendance 10,797; 36 lyceums for girls, enrollment 8277, attendance 6789; 15 normal schools, with 2322 students; 277 manual training schools. The University of Chile had 2002 students, and the Catholic University 683. The state religion is Roman Catholicism, but religious toleration prevails.

AGRICULTURE. Figures published in 1912 by the Chilean bureau of statistics show the following estimated production of the principal cereals and foodstuffs: Wheat, 496,022 metric tons; barley, 53,562; oats, 27,006; corn, 31,002; beans, 37,026; carobs, 7486; potatoes, 202,481. Estimated wine production, 990,644 hectoliters. The pastoral industry is developing, notably in wool production in the south.

MINING. The country's prosperity is largely due to the production of enormous quantities of sodium nitrate in the northern provinces of Antofagasta and Tarapacá. This valuable fertilizer is exported to many countries. Coal is mined (898,971 metric tons in 1909), though not in sufficient quantity to supply the domestic demand. Copper, for which Chile was once famous, shows a tendency to regain its former importance (in 1909, 42,726 metric tons, valued at about \$9,939,300). See the export values of mineral products in the section **Commerce**.

COMMERCE. Imports and exports, special trade, in thousands of pesos gold:

	1908	1909	1910	1911
Imports.....	267,264	262,083	297,486	348,390
Exports.....	319,149	306,430	317,213	330,621

The leading imports include cotton and woolen goods, iron and steel manufactures, and coal. Principal exports in 1911, in thousands of pesos gold: Nitrate, 262,649; copper, 18,687; hides and leather, 8983; wool, 7696; calcium borate, 6231; iodine, 5140; meat, 3769; nuts, 1858; barley, 1853; beans, 1834; oats, 1590; wheat, 1384; whale oil, 1164; bran, 1150; flour, 827.

Imports and exports, special trade, 1911, in thousands of pesos gold, by principal coun-

tries: Great Britain, 111,768 and 145,913; Germany, 89,579 and 71,780; United States, 43,222 and 53,577; France, 18,991 and 16,069; Belgium, 10,567 and 9532; Argentina, 21,410 and 3284; Peru, 20,344 and 1074; Italy, 8681 and 979; Netherlands, 274 and 9429; Spain, 3600 and 5511; Australia, 6056 and 63.

SHIPPING. Entered at the ports in the foreign trade, 1911, 4115 vessels of 11,309,296 tons (steam, 3626 of 10,449,368 tons); cleared, 3418 of 9,303,926 tons (steam, 3021 of 3,593,069 tons). Entered coastwise, 11,018 vessels of 15,939,724 tons (steam, 10,484 of 15,797,835 tons); cleared, 10,547 of 18,292,445 tons (steam, 10,979 of 17,620,939 tons). Merchant marine, 1911: 84 steamers of 69,604 tons net and 91 sail of 52,918 tons net.

COMMUNICATIONS. The length of railways in operation is reported at 5804 kilometers, of which 2706 kms. are state lines and 3098 private; under construction, 2243 kms. Since this report was made, a considerable amount (exact figures not available) of the railway under construction has been completed. The Chile longitudinal railway, a meter gauge line over 350 miles in length, was almost completed in 1912. This work included the Espino tunnel and the Andean section, which was the last of five tunnels through the mountains on a section where 44 miles of rack road are required. Other lines under construction or completed during 1912 were the following: Paloma-San Marcos, Copiapo-Lagunas, Vallimar-Algarrobal, San Bernardo-Volcan, Malipilla-San Antonio, Rancagua-Donihua, Alcomes-Pichilimu, and Curico-Hualam and also the Chilean Northern Railway, the Pueblo Hundo-Pintados line, joining the Chanaral and Iquique railways, of which 719 kilometers were under construction, had 390 kilometers completed in 1912. The Chilean railways aggregated over 5000 miles in length. Telegraph lines (1910), 22,334 miles, of which 16,513 state; post offices, about 1100.

FINANCE. The monetary unit is the peso, worth 36.5 cents. The value of the paper peso is about 22 cents. Revenue, 1910, 82,764,423 pesos gold and 152,975,645 paper; expenditure, 60,677,704 pesos gold and 234,143,253 paper. The chief sources of revenue were: Nitrate export duties, 79,665,417 pesos gold; state railways, 47,760,751 paper; import duties, 44,436,032 paper; surtax on imports, 29,608,792 paper. Estimate expenditure, 1912, 81,070,927 pesos gold and 280,894,118 paper; 1913, 55,746,850 gold and 268,596,590 paper. Chief departmental estimates, 1912: Finance, 35,876,488 pesos gold and 16,572,749 paper; marine, 16,986,459 and 14,725,348; war, 674,684 and 33,115,000; industry and public works, 24,256,843 and 113,707,948; interior, 1,103,183 and 42,728,561; public instruction, 542,640 and 43,240,683. Debt (December 31, 1910): Foreign, 336,781,600 pesos gold; internal, 6,093,800 gold and 179,465,191 paper.

ARMY. The Chilean army was in course of reorganization during the year 1912 and it was expected that this would be completed by the end of 1913. The establishment of the active army was fixed for 1912 at 17,860, including a permanent staff of 8000. There were in addition 2500 men in the coast artillery and 1737 in the gendarmerie. The organization included 10 regiments of infantry, 8 regiments of cavalry, 20 batteries of field artillery, 1 mountain battery, 2 battalions of mounted infantry, and

a corps of engineers. The active army is supposed to be raised to 150,000 war strength by including a portion of the national guard.

NAVY. The Chilean navy in 1912 included: Two battleships, aggregating 15,600 tons (*Capitán Prat*, built in 1892, and *O'Higgins*, 1897); one armored cruiser, 7000 tons (*Esmeralda*, 1896); four protected cruisers, 14,500 tons (built 1890-99); two torpedo cruisers, 1470 tons; seven torpedo-boat destroyers, 2270 tons; five first-class torpedo boats, 728 tons, and several auxiliary vessels, transports, etc. The keel of a 28,600-ton dreadnought, the *Almirante Latorre*, was laid down at Elswick December 1, 1911. The construction of a second dreadnought, the *Almirante Cochrane*, was decided upon in 1912. Contracts for six destroyers and two submarines were let in 1911, and the first of the destroyers was launched September 28, 1912.

GOVERNMENT. The president is elected by indirect vote for five years and is assisted by a council of state and a responsible ministry. The legislative body consists of the Senate (37 members, elected for six years) and the Chamber of Deputies (108, for three years). The president in 1912 was Ramón Barros Luco, inaugurated December 23, 1910. Ministry, formed August 10, 1912: Premier and minister of the interior, Guillermo Barros; foreign affairs, worship, and colonization, Antonio Huneeus; justice and public instruction, Enrique Villegas; finance, Manuel Rivas; war and marine, Claudio Vicuña; industry and public works, Oscar Viel.

For events connected with arbitration in Chile in 1912 see **ARBITRATION, INTERNATIONAL.**

CHINA. A successful revolution, followed by the abdication of the infant emperor, transformed the Chinese Empire into the Chinese Republic, February 12, 1912. The capital is Peking.

AREA AND POPULATION. The country has a total estimated area of 4,278,143 square miles, and consists of the following: China proper, or "the eighteen provinces"; the three provinces comprising Manchuria; Sinkiang province (which includes East Turkestan); and the dependencies of Mongolia and Tibet. The population is unknown. Of China proper there have been many censuses, or government estimates, the results of some of these being: 1761, 190,257,000; 1812, 360,440,000; 1842, 413,021,000; 1860, 260,925,000; 1882, 381,309,000; 1885, 377,636,000. Chinese censuses hitherto have been enumerations of households, whence the number of persons is computed by multiplying by the average number in a household (exclusive of children under six years of age). For the census taken in 1910 averages varied in different provinces from 3.1 to 5.8 per household; in Chihli it was 5.5 (but in Peking city 5.8); in some provinces the average was not ascertained, or at least not published. The mean of the ascertained averages was 4.8, and this figure has been used in calculating the population of provinces for which no specific average is given. The problem is further complicated by incompleteness of returns from Shansi and Szechwan. The figure for the latter province given below is not shown by the census, but is the number reported by the viceroy to the Peking authorities; judged from the partial returns of the census, the figure is plausible. The population figures for China proper, excepting the one for

Szechwan, are those published in 1912 by W. W. Rockhill as his interpretation of the 1910 census. Mr. Rockhill, American ambassador at Constantinople and formerly American minister at Peking, has published monographs on Chinese population summarizing the extant data; in 1904 he placed the population of China proper at less than 275,000,000, and in 1912 said that, although the new information furnished by the 1910 census is insufficient for definite conclusions, it tends to confirm the opinion that the population of China is much smaller than we have been led to believe and that in the last century it has been increasing very slowly, if at all. In the last column of the table are given the estimates of the Maritime Customs in its report published in 1912.

	Sq. m.	Census '10	M. C. est.
Anhui	54,826	14,077,683	36,000,000
Chekiang	36,680	13,942,655	11,800,000

Tibet	†756,000	2,000,000(?)
Total	4,278,143	329,617,750

* Honan, Kansu, Kweichow, Shansi, and Shensi, 55,000,000. †Not including infants under six. ‡including Kuku-nor and Tsaidam.

The annual estimates of the Maritime Customs (those for 1912 are given above) are widely quoted and often regarded as authoritative. But in respect of more than half of the provinces, they are beyond all doubt gross exaggerations; they are based on no known authority and, in any serious attempt to deduce an approximate figure for the population of China, are negligible factors.

The census of Peking taken in 1908 by the Ministry of the Interior disclosed 126,008 households; this indicates, on the basis of 5.8 persons to the household, a population of 730,846 (of whom 458,252 in the Tartar city, and 272,594 in the Chinese), the number being exclusive of infants under six. The 1910 census gives Peking a population of 805,110. The excess of males is notable, adult males numbering 500,819, adult females 256,638, and children (6 to 16) 47,653. If we estimate the proportion of infants under 6 at two per cent.,

the total of all persons in Peking is about 821,000.

For the treaty ports, the Maritime Customs' estimates probably represent the actual population more accurately than they do for the provinces; these estimates in 1912 for the larger treaty ports: Canton, 900,000; Hankow, 826,000; Tientsin, 800,000; Shanghai, 651,000; Foochow, 654,000; Chungking, 598,000; Soochow, 500,000; Ningpo, 350,000; Hangchow, 350,000; Nanking, 267,000; Changsha, 250,000; Chinkiang, 184,000; Antung, 161,000; Wuhu, 122,000; Amoy, 114,000; Wenchow, 100,000; Shansi, 90,000; Swatow, 66,000; Kongmoon, 62,000; Newchwang, 61,000. The Maritime Customs placed the numbers of foreigners living in the treaty ports in 1911 at 153,522, of whom 78,306 Japanese, 51,221 Russian, 10,256 British, 3470 American, 3224 Portuguese, 2758 German, and 1925 French.

EDUCATION. There are three classes of schools—the old-style schools, the mission schools, and the public schools—conducted more or less under western methods. The old-style schools are private institutions, whose curriculum is confined practically to the Chinese classics. Examination in the classics as the test for government employment was abolished by the decree of September 3, 1905, which also provided for an elaborate educational system based on that of Japan. In 1912 the Ministry of Public Instruction stated that it does not publish statistics of educational conditions.

INDUSTRIES.—China proper, though a distinctively agricultural country, is rich in minerals. Its coal deposits are among the richest in the world, but exploitation has not attained a great development. Tin, iron, antimony, lead, zinc, copper, and salt are worked, tin (in Yunnan) and iron being the most important. The principal crops include wheat, barley, corn, millet, beans, and peas, in the north; in the south, rice, cotton, and sugar. Tea and silk cocoons are products of extreme importance, the former in the west and south, the latter in every province. There is a large silk manufacture, but it is feared that, unless easily remediable defects are attended to, Chinese pongees will have to yield place in European markets to much inferior imitation makes.

Large amounts of opium have been produced, especially in Szechwan, but the output, pursuant to government decree, and the importation from India, through the coöperation of the Indian government, are being contracted. An agreement between China and Great Britain signed May 8, 1911, provides that the consolidated opium duty (import and likin) be raised from hk. tls. 110 to hk. tls. 350 per picul (133 1-3 pounds), that the export of opium from India to China shall cease before 1917, if clear proof be given of the complete absence of production of native opium in China, and that Indian opium shall not be conveyed into any province of China which has suppressed the cultivation and import of native opium. Imports of native opium recorded at the customs in 1911 amounted to 3384 piculs, against 19,875 piculs in 1910. It was reported that no opium was under cultivation in Szechwan in 1911; in that year the amount passing Ichang downwards was 688 piculs, against 28,530 piculs in 1910. The poppy is replaced with wheat, and Szechwan promises to regain her position as one of China's granaries.

The net importation of foreign opium into China in 1911 was 27,808 piculs, valued at hk. tls. 48,256,745, as compared with 35,358 piculs, valued at hk. tls. 55,410,850 in 1910, and 48,917 piculs, hk. tls. 35,744,979, in 1909. Restricted traffic in the drug has provoked speculation, and prices have trebled and quadrupled; thus, in 1907, the date of the first restriction agreement, which was superseded by the more stringent one of 1911, the Hongkong value of new Benares opium was 915 dollars (Mexican) per chest (about 160 pounds), whereas in 1911 it was 3800 dollars. See paragraph below on *Opium Question*.

COMMERCE. The total foreign trade of 1909 was the greatest recorded up to that time; it was exceeded, however, by the trade of 1910, and the latter by that of 1911. Values are stated in haikwan, or maritime customs, taels. This unit fluctuates with the price of silver; in 1907 it was worth about 79 cents, in 1908 65.5 cents, in 1909 63.4 cents, and during 1910 and 1911 it averaged 66 and 65 cents respectively. The following table shows the values in haikwan taels of total imports, imports for consumption, total exports, and exports of Chinese produce:

Year	Imports		Exports	
	Total	Net	Total	Chinese
1902	325,546,311	315,363,905	224,363,990	214,181,584
1905	461,194,532	447,100,791	241,981,938	227,888,197
1907	429,071,662	416,491,369	277,050,990	264,380,697
1909	430,048,606	418,168,067	350,883,353	338,992,814
1910	476,553,402	462,964,894	394,421,836	380,833,328
1911	482,576,127	471,503,943	388,410,350	377,338,166

Principal imports in 1910 and 1911, in thousands of haikwan taels: Cotton goods, 65,878 and 89,295; cotton yarn, 65,304 and 51,172; opium, 55,411 and 48,257; sugar, 22,441 and 22,602; rice, 31,320 and 18,699; iron, 9252 and 13,180; dyes, etc., 9720 and 12,313; tobacco, 9418 and 10,711; fish, 8959 and 10,063; flour, 8708 in 1911; coal, etc., 8196 and 8468; machinery, 6897 and 6793; wood, 6001 and 5842; paper, 4181 and 5606; matches, 5275 and 5298; leather, 4740 and 4810; woolen goods, 4116 and 4287.

Leading exports in 1910 and 1911, in thousands of haikwan taels: Raw silk, 80,242 and 74,510; beans and bean cake, 36,681 and 48,190; tea, 35,931 and 38,335; cotton, 28,352 and 21,608; silk manufactures, 19,072 and 18,166; hides and skins, 19,930 and 16,519; straw goods, 11,921 and 15,418; oils, 13,992 and 14,831; sesame, 14,377 and 11,739; wool, 5191 and 7648; tin, 6246 and 6436; wheat, 6286 in 1911; peanuts, 3120 and 4563; silks, 4417 and 4339; cattle, 4553 and 4205; paper, 3506 and 3582; fireworks, 4075 and 3480; tobacco, 3512 and 3231; fruits, 3217 in 1911, medicines, 3003 and 3155. The export of silk in 1911 amounted to 96,094 piculs (against 110,184 in 1910), exclusive of cocoons 20,925 piculs, refuse cocoons 38,240, wild raw 33,831, waste 117,937, and waste yarn 144. Tea export: Black, 734,180 piculs; green, 299,237; brick, 416,656; tablet, 9073; dust, 3657; total, 1,462,803, against 1,560,800 in 1910. Imports of coin and bullion in 1911 amounted to hk. tls. 65,120,036, and exports hk. tls. 25,267,603. Partly through a decline in price due to competition between the Standard Oil Company and the Royal Dutch-Shell combination, the importation of kerosene advanced from 74,508,657 gals. in 1910 to 235,898,240 gals. in 1911.

The following table shows imports (including re-exports) and domestic exports by countries, in thousands of haikwan taels:

Countries	Imports		Exports	
	1910	1911	1910	1911
Hongkong	172,466	148,249	138,723	103,670
Great Britain	70,949	89,997	18,703	17,295
Japan	76,756	79,506	61,606	62,049
United States	24,799	40,823	32,289	33,966

1910	36,282	12,765	33,785	12,545

COMMUNICATIONS. Rivers and canals in China are of more importance to commerce than are roads, which, though numerous, are generally in poor condition. An imperial edict of May 9, 1911, announced the government's intention to nationalize privately-owned main railroad lines. This order, which contributed to the unrest that came to a head in the rebellion of the following October, had special reference to the two great lines under construction, the Canton-Hankow and the Szechwan-Hupeh. About the beginning of 1912 the reported length of railway open to traffic was 5822 1-2 miles; under construction, 2205 miles (the latter figure includes lines on which work had been begun even though subsequently suspended or abandoned).

The separate lines are as follows: (1) Chinese

Eastern Railway (Russian control); 4 Manchouli-Harbin-Suifenho, 950 miles; 6 Harbin-Kwanchengtze (Changchun), 131. Branch, Angangki-Tsitsihar, 17. (2) South Manchurian Railway (Japanese control): Kwanchengtze-Dairen, 437 1-2. Branches: Kwanchengtze-Kirin (Chinese control), 30 opened, 50 under construction; Mukden-Antung, 189; Suchiatun-Fushun Collieries, 39; Yentai-Taikang Collieries, 10; Tashikiao-Yingkow (Newchwang), 13; Liushutun branch, 3 1-2; Choushuitze-Port Arthur, 31 1-2. The foregoing lines and the Kowpangtze-Yingkow branch (57) and the Shanhaikwan-Mukden section of the Imperial Railways are in Manchuria—total, about 2182 miles. (3) Imperial-Railways of North China: Peking - Tientsin - Sinminia - Mukden, 522. Branches: Peking-Tungchow, 12; Peking-Lukowkiao (junction with Hankow Railway), 4; Tangku-Chinwangtao, 6; Lianshan-Hulutao Harbor, under construction, 7; Kowpangtze-Yinkow, 57. (4) Peking-Kalgan Railway: Peking-Kalgan, 124; Kalgan-Tienchen-Tatungfu-Suiyuan, of which Kalgan-Tienchen, 55 miles, completed and Tatungfu-Suiyuan, 165 miles, under construction. Branch: Peking-Mentowkow, 16 1-2. (5) Peking-Hankow Railway: Peking-Hankow, 755. Branches: Liangsiang-Toli, 12; Liuliho-Chaokiaichwang, 10; Kaoyih sien-Lincheng, 10 (these three branches to local coal mines); Kaopeitien-Siling (imperial tombs), 26; Paotingfu branch, 3; Chochow-Yüchow, 12. (6) Tientsin-Pukow (Kiangsu) Railway: Northern section (German), Tientsin-Tsainan-Tainanfu-Hanchwang, 390; southern section (British), Pukow-Linhwaikwan-Süchowfu-Likwoyi, 236 (though running November 29, 1911, between Tientsin and Pukow, which is across the Yangtse from Nanking). (7) Shantung Railway (German control): Tsingtau-Tsainan, 256. Branch, Changtien-Poshan, 28. (8) Shansi Railways: Taiyüanfu-Shihkiaichwang (the Chengtai Railway), 151; Yütze-Taikuh sien-Pingyaohsien, under construction, 40. (9) Taokow-Sinsiang-Tsinghwaichen. 96. Branch, Fawangchen-Jameisen, 7. (10) Kaifeng-Chengchow-Honanfu, 140. (11) Honanfu-Tungkwan, under construction, 166—to reach Sianfu, 240 miles from Honanfu. (12) Tichshanfu-Hwangshihkang (Tayeh Mines Railway, Hupeh), 17. (13) Szechwan-Hupeh Railway: Kwangshui, on the Peking-Hankow line in Hupeh, to Kweichowfu, in Szechwan, via Ichang, under construction, 800. (14) Canton-Hankow Railway, total length 739 miles, of which open 73 miles. Canton-Yingiak and 30 miles Chuchow-Changsha. Branches: Canton-Fatshan-Samshul, 32; Chuchow-Pingsiang, 65. (15) Canton-Kowloon, 112 (89 1-2 Chinese, 22 1-2 British). (16) Sinhung Railway, in Kwangtung, 55 miles, of which 40 open. (17) Yunnan Railway (French): Laokai, on the Tongking frontier, to Yunnanfu, via Mengtze, 291 miles, an extension of the French Indo-Chinese line from Hanoi. (18) Swatow-Chaochowfu 24. (19) Amoy-Changchowfu, 10 open, 23 under construction. (20) Kiukiang-Nanchang, 82, of which 20 open from Kiukiang. (21) Anhwei Railway, 150 from Wuhu, none of which open, and construction suspended. (22) Kiangsu-Chekiang Railway: Shanghai-Kashing-Hangchow, 118; Hangchow-Ningpo, under construction, 100. (23) Shanghai-Nankin Railway: Shanghai - Soochow - Chinkiang - Nanking, 193. Branches: Shanghai-Woosung 10; Nanking City Railway, 7 1-2. Total miles open at be-

ginning of 1912, 5822 1-2; under construction, 2205.

FINANCE. A comprehensive statement of actual revenue and expenditure is not available. Under the empire probably a considerable part of the revenue found its way into the private purse of the provincial collectors. Whether or not such speculation flourishes under the republic, it is certain that the financial straits of the government in recent years continued in 1912. The budget for 1911 showed estimated revenue hk. tls. 297,000,000 and estimated expenditure hk. tls. 351,000,000; for 1912, hk. tls. 297,000,000 and hk. tls. 576,520,000.

Exact records are made and reported for the receipts from the Maritime Customs. These have been: 1908, hk. tls. 32,901,895; 1909, 35,539,917; 1910, 35,571,879. In 1911, they amounted to hk. tls. 36,179,225, of which hk. tls. 29,656,393 were derived from foreign trade and hk. tls. 6,523,432 from home trade. In detail: Duties on imports (including opium), hk. tls. 14,742,801; duties on exports of native produce, 12,622,759 (to foreign countries 8,135,021, to Chinese ports 4,487,738); coast trade duties (including opium), 2,035,694; tonnage dues, 1,346,385; transit dues inwards, 1,289,991, and outwards, 578,039; opium likin, 3,564,153; total, hk. tls. 36,197,825, as compared with hk. tls. 35,571,879 in 1910, 36,068,595 in 1908, and 30,007,044 in 1902. Opium import duties in 1911 amounted to hk. tls. 1,391,632; these duties in 1911 (exclusive of opium) was hk. tls. 4,955,788, against 4,052,022 in 1910, the increase being due largely to the raising of the consolidated tax from hk. tls. per picul to hk. tls. 350 on May 8, 1911. The increase in import 353,692, was due to larger importations of kerosene and cottons; a decrease in export duties, hk. tls. 374,607 is attributed to the combined effects of flood, famine, and revolution. See below, paragraph *Foreign Loan*.

The public debt, January 1, 1911, stood as follows: £59,892,171, 377,783,388 francs; 12,470,000 yen; \$2,220,000; Shanghai tls. 3,270,000; hk. tls. 421,499,998 (the 1901 indemnity to the Powers); the total amounting to \$658,669,498.

ARMY. The difficult task of organizing the army of the Chinese Republic in 1912 was in the hands of Major Brissand-Desmallet of the French army. An active and a reserve army independent of the provincial militia was being organized with the guard division as the pattern and the tactical school. The plan of organization involved 5 years spent in the active army and then its graduates would pass into the reserve. Attention was also being paid to plans for the reorganization of the militia, but the entire scheme or reorganization, so far as its execution was concerned, was rather in an elementary condition. A school of aviation was established under an American instructor at Canton and war material, much of it of German origin, was being provided. An opportunity to view the Chinese army was given on October 10, at Peking, when 11,600 troops of all arms took part in a review on the anniversary of the Revolution. The Republican Guard, the Imperial Guard, gendarmerie, reserve troops, Imperial and Republican Guard Cavalry and Republican and Imperial Guard Artillery, paraded to the number of about 11,500 and made a good appearance, the Republican Guard being of the best physique. The Republican Guard Artillery had on parade 12 Japanese mountain

guns, and 12 Skoda 75 mm. (2.95 in.) Q. F. field guns, 1910 model.

NAVY. Since the war with Japan in 1895, the Chinese navy has not included an armored ship. Aside from small craft, the only serviceable vessels are six cruisers. Of these, four (one of 4300 tons and three of about 3000 tons each) were built in 1897 and 1898; the fifth, the *Ying Swei*, of 2400 tons, was launched at Barrow, July 14, 1911, and the sixth, the *Chao Ho*, of 2400 tons, at Elswick, October 23, 1911. A seventh cruiser, of the same type as the *Ying Swei*, was launched at the yard of the New York Shipbuilding Company, May 4, 1912. A river gunboat was launched at Kiel, in 1911, and a gunboat of 780 tons, the *Yung Fung*, was nearing completion at Nagasaki, at the end of 1912. There is a considerable number of torpedo boats, river gunboats, etc.

GOVERNMENT. The rule of the Manchu dynasty, which began in 1644, came to an end with the abdication of the emperor, Pu-yi, February 12, 1912. The emperor Tsai-t'ien (reign title, Kuang-hsü), died August 14, 1908, and was succeeded on November 14 following, by his brother's son Pu-yi (reign title, Hsün-t'ung), who was born February 11, 1906. The emperor's father, Prince Chun, was regent. A constitution drawn up by the Senate was sanctioned by an edict of November 3, 1911. On November 1 Yuan Shih-kai, who had been summoned by the regent, was granted the powers of a dictator, and on December 6 the regent abdicated. On December 29 the Nanking (Republican) Assembly elected Sun Yat Sen president of the republic of China. After the emperor's abdication, the Nanking Assembly, on February 15, 1912, elected Yuan Shih-kai provisional president of the republic, Sun Yat Sen retiring in his favor. Yuan was formally installed at Peking, on March 10, and a cabinet was formed with Tang Shao-yi as premier. Tang was succeeded in June by Lu Chêng-hsiang. In November, 1912, a new ministry was formed, as follows: Premier and minister of the interior, Chao Ping-chuan; foreign affairs, Liang Yü-hao; finance, Cheu Hsiieh-hsi; war, Tuan Chih-jui; marine, Liu K'ian-su; education, Fan Yuan-lien; justice, Hsu Shih-ying; agriculture and forests, Ch'en Chen-hsien; industry and commerce, Liu K'uei-yi; posts and communications, Chu Ch'ih-chien.

HISTORY

THE PROVISIONAL GOVERNMENT. Dr. Sun Yat Sen, who it will be remembered was elected president of the new republic at Nanking, at the close of 1911, formed a cabinet which comprised some of the ablest men of the empire, among others, Wang Chung-hui, a graduate of Yale University. In a message issued at the beginning of the year, the new president assailed the Manchu dynasty for its tyranny and demanded the opening of the country to foreign trade and promised to maintain treaty obligations. Before the close of 1911, the powers had agreed upon a plan for the protection of the railway line from Peking to the sea. Early in January, United States troops were ordered from Manila for that purpose and a large reinforcement of British troops was ordered from Hongkong to Canton. In January a renewal of hostilities seemed imminent, the negotiations between the revolutionaries and the government having come to a standstill. The

movement to bring about the abdication of the emperor steadily gained force in China and by the middle of the month it was clear that it was not only supported by popular opinion, but by almost the whole body of princes. The Manchus, however, were much concerned as to their future treatment and earnestly desired the continuance of Yuan Shih-kai in office as he had rendered loyal service to the throne. Negotiations looking to abdication were going on throughout the early part of January. These provided for generous treatment of the emperor and his court as well as of the Manchus generally. Much excitement was caused by an attempt, on January 16, to assassinate Yuan Shih-kai, while returning from an audience at the palace. Three bombs were thrown at him in the street but though some twenty persons were wounded he himself was not hurt.

On January 18, it was announced that an agreement had been reached between the imperialists and the Republicans for the abdication of the emperor and the selection of Yuan Shih-kai as president in place of Sun Yat Sen, who would retire in his favor. Soon afterwards much alarm was caused by the report that Sun Yat Sen had repudiated his promise and would insist on the transfer of the imperial authority directly to the provisional republican government at Nanking. The terms of abdication, however, were finally agreed upon. They included the annual grant of 4,000,000 taels to the emperor, and the provision that he should reside first in the Forbidden City, and ultimately in the Summer Palace, and that he should receive such honors as are accorded to a foreign sovereign visiting China. An imperial bodyguard was to be provided by the republic. The private property of the emperor and princes was to be respected. So also was the rank of princes and hereditary nobles, whose order of succession should be maintained. On February 12, the Manchu dynasty, which had held the throne for 267 years, formally abdicated and proclaimed a republic. Three edicts were issued on that day announcing the change. The first, after briefly reviewing the history of the revolution, declares that the form of government shall be a constitutional republic and that plenary powers are given to Yuan Shih-kai to establish a provisional republican government, and to confer with the Nanking government as to measures for carrying out this purpose with harmony. This decree was signed by Yuan Shih-kai and six members of the cabinet. The second decree pronounces the terms of abdication satisfactory, and the third urges the people and the officials to maintain peace. The decrees were received with satisfaction and proclamations of the change in government were posted in public places. Official notice was given to the legations, which were requested to make them known to their respective governments. The ancient flag of China, the yellow dragon, was abolished and a new flag adopted, which was composed of five stripes, crimson, yellow, white, blue, and black, symbolizing the five races of the republic, namely, Mongols, Chinese, Manchus, Mohammedans, and Tibetans.

On February 15, Yuan Shih-kai was chosen president, and on February 20, Gen. Li Yuan Heng was chosen vice-president. On February 27, Yuan Shih-kai received delegates from the Nanking Assembly, who extended to him the invitation to come to Nanking and assume office. Yuan Shih-kai accepted the invitation,

saying that he would proceed to Nanking as soon as circumstances permitted. The situation was temporarily complicated by an outbreak on February 29, of the troops of the Third Division, which had hitherto been regarded as trustworthy. Reports of widespread disaffection throughout the North occasioned much alarm, but martial law was declared at Peking and order soon restored. On March 10, Yuan Shih-kai took the oath of office as provisional president, and it was announced that the new cabinet would be formed under the premiership of Tang Shao-yi. At a formal meeting of the Assembly at Nanking, Sun Yat Sen and the provisional government laid down their office. On the following day the Assembly agreed to transfer the seat of the government to Peking. The first cabinet was made up of the members of the Nanking and Peking governments, under the premiership of Tang Shao-yi, who held also the portfolio of the minister of communications. The members of the cabinet were remarkable for their knowledge and experience, almost all of them having special acquaintance with European affairs and having traveled abroad. It was then decided that the Advisory Council of Nanking upon removal to Peking should continue to act as a National Assembly until the meeting of the new parliament, which was to take place before October.

Soon after the establishment of the republic, much anxiety was caused by the sudden mutiny of 1500 troops at Nanking on April 11. Loyal troops, however, were soon hurried to the district and after some fighting order was restored. The loss of life was placed at from 200 to 300. The Advisory Council was formally opened at Peking on April 29. The new president, Yuan Shih-kai, in the address outlined some of the reforms essential to the country's welfare. He urged the strengthening of friendship with foreign states, the necessity of reforming land taxation and mining regulations, including the currency system of introducing uniform weights and measures, improving education, legal procedure, and means of communication, and advocating the employment of foreign experts in finance, agriculture, and forestry. In June the foreign minister, Lu Cheng-hsiang, was appointed premier and his nomination was approved by the Advisory Council on June 29. The appointment was generally acceptable, both to the Chinese themselves, and to the foreign legations. In September, Liang Men-Tung was appointed foreign minister, the premier having relinquished the portfolio.

DIFFICULTIES OF THE NEW RÉGIME. The new government was endangered by the separatist tendencies of the southern provinces, the reactionary spirit in the North, where the monarchist sentiment was strong, and above all by the growing ascendancy of the army. The commanders of the military forces in the provinces began to assert political authority and it was feared that the military power would soon dominate the government as it had done in Turkey. The danger was enhanced by the uncertainty and inequality of the soldiers' pay, owing to the financial embarrassment of the government. The assistance which Yuan Shih-kai had expected from the foreign powers had not been forthcoming. He could not command foreign loans unless he could assure foreign capitalists of such a degree of control over expendi-

tures as would stir up opposition in the provinces. (See below *Foreign Loan*.) The execution of two generals who had been in the revolutionary movement and who were now charged with attempting to incite another revolution led to an attack on the government in the Assembly. The trial was by court-martial and the procedure was summary. The government's opponents argued that at Hankow where the trial took place the civil authorities should have had jurisdiction, as the military administration had been dissolved. The Advisory Assembly petitioned Yuan Shih-kai for further explanation and upon receiving it pronounced it unsatisfactory and demanded the attendance of the premier and war minister at its session. This Yuan Shih-kai refused. The criticism of the government for the executions, though emphatic at first, soon subsided. Dr. Sun Yat Sen visited Peking in the latter part of August and was received with popular enthusiasm. He argued for a strong central government, loyal support of the president, and the sinking of party differences. Much was said in the European press about the weakness of the new government owing to dissensions among the party groups. Doctor Morrison, who had lately been appointed Chinese adviser, described the conditions in more favorable terms. He pointed out that the three party groups in the Advisory Council, though they differed in their programmes, were all republicans. He denied that their differences were of a kind that would lead to civil war or disrupt the national unity. The leading and most powerful party had no such tendency. Its aims were merely: The establishment of a party cabinet instead of a coalition government; the reform of the administration; the enforcement of conscription; the spread of education; the equality of the sexes; and a policy of colonization.

At the end of the year elections were being held under a recent law of the National Council, providing for a permanent constitutional government. The new legislature or National Assembly was to be bi-cameral, consisting of an upper house whose members were to be chosen indirectly by the provincial assemblies and to serve six years, one-third retiring every two years, and a lower house whose members were to be elected by popular vote, the qualifications for the suffrage being: The payment of a direct tax of \$2.00 or more, or the ownership of immovable property to the value of \$500 or more, or the possession of certain educational qualifications. The ratio of representation was one for every 800,000 inhabitants, but no province was to have less than ten representatives. The number of qualified voters as appeared from reports published at the close of the year was very small. Some estimates placed it at 2,000,000.

FOREIGN LOAN. On March 14, the Chinese government secured a joint loan from British and Belgian capitalists. This led to a protest from the ministers of Great Britain, France, Germany, and the United States, on the ground that it violated prior agreements with the "four nations" banks who had offered a loan to the government without security and had received an option to finance the government up to the end of August. The Chinese government agreed to cancel the Belgian arrangement. Negotiations were subsequently begun with the four nations for a

loan of £60,000,000, but difficulties arose concerning the safeguards which the latter required. These guarantees involved the strengthening of the central government, but this conflicted with the aspiration of the provinces for a greater measure of self-government. The further objection was raised by many of the Chinese that it tended toward foreign domination. The British government, many years ago, refused to lend its sanction to any loans except such as were made through the Hongkong and Shanghai Bank, and the allied German corporation, the Deutsch-Asiatische Bank. Over the loans thus negotiated the British and German governments assumed control. These loans were examined by the authorities and were subject to certain conditions to insure safety. The government also stood behind the banks. Later, by the inclusion of the French banks in the consortium, this dual control became a triple control and still later the United States was added. To the four powers having this privilege, Russia and Japan were added in June, 1912, on the understanding that the loan should contain no terms injurious to their special interests. During the summer of 1912, negotiations were carried on with this six-power group of bankers for a loan, whose figure was placed by the press at £60,000,000, but they were impeded by the fact that the conditions imposed were regarded by many of the Chinese as humiliating to the new government. There were, moreover, opportunities of making arrangements with outside bankers who would not exact such conditions. In some quarters it was argued that the consortium was a monopoly and even if it had been justified in the past it was not now that China had at last acquired a stable government. While the negotiations with the six-power group were pending, other negotiations with a London company, Messrs. C. Birch Crisp, resulted in the authorization of a loan of £10,000,000, whereupon the six-power group declared that they could not proceed with the matter so long as such separate arrangements were pending. The loan with the London syndicate was concluded on August 30. The London foreign office was notified on September 4. Inquiries into the state of Chinese finance seemed to indicate that almost all the proceeds of the new loan would have to be paid out immediately to meet arrears. The British government, through its minister at Peking expressed its disapproval of the loan and argued that it would do little to relieve necessities as the foreign liabilities at the close of 1912 would exceed the £10,000,000. The conditions which the six-power group had sought to impose and which checked the negotiations were made known toward the end of September. They involved the control of expenditure through the appointment of a foreign auditor as in previous cases, who was to insure the proper application of the funds and to cause annual statements to be issued, and, secondly, foreign supervision of the collection of the revenues. The latter condition was declared by the Chinese government to be an infringement of its sovereign rights. On this point the negotiators could not agree.

The new loan, officially entitled the "Chinese government 5 per cent. Gold Loan for 1912," was for £5,000,000, only half the amount authorized and issued at 95 per cent. Payment of both interest and principal were made a first charge on the surplus revenues of the salt

tax (*gabelle*), which were estimated at about £3,610,000. It was to run for 40 years. It was floated on September 26. As to the various objections to the loan, and particularly the British government's opposition, Mr. Crisp made a public statement in the latter part of September to the effect that his examination of Chinese conditions did not bear out the contentions of the foreign office, that the loan would be repudiated. On the contrary, he had gathered from Doctor Morrison, the Chinese adviser, and from other sources that conditions were widely different from what the foreign office supposed. He did not believe that the loan would be repudiated and he found that his confidence was shared by other financiers. He and his associates believed the transaction would be remunerative and would also do something toward the restoration of British prestige in China. The powers objected to the loan on the ground that the revenues on which it was secured were already hypothecated to other services. On November 5 the Chinese government announced that other revenues would be applied to the service on the loan and on the following day negotiations with the six-power group were reopened. It was announced on December 12 that the six-power group would issue a loan on terms favorable to China and would allow Crisp and Co., and other British firms to participate.

MONGOLIA. At the close of 1911 there were repeated rumors of a Russian design to annex Mongolia. The Chinese revolution had aroused a separatist movement in the eastern half of Mongolia, where the Chinese authorities were superseded by Mongolian dignitaries. In the western half the Chinese functionaries refused to leave and the natives were unable to remove them. Early in January, Russia informed the Chinese government that Outer Mongolia must be recognized as independent so far as its internal affairs were concerned and that Russia would aid the natives in maintaining order and in constructing a railway from Kiakhta to Urga. The Chinese government was to retain control of the external affairs, but was not to maintain military forces in the territory. Russia had previously warned the imperial government against the aggressive policy of China in Mongolian affairs, and reminded it of Russia's privileges in Mongolia as regarded railways and mines. Russia professed no desire for the separation of Mongolia from China, but insisted on Mongolian autonomy under Chinese sovereignty. It was finally announced early in January that the Russian government was not aiming at a protectorate in Mongolia, as was suspected, but was merely acting as an intermediary accepted by both countries in the difficulty arising over the Mongolian movement for autonomy which followed the Chinese revolution. Later in the year Russia was clearly determined to recognize Outer Mongolia as an autonomous state, and on November 3, the Russian representative at Urga concluded a treaty between Russia and Mongolia, whereby the former was to aid Mongolia in maintaining autonomy, to support her right to a national army, and to exclude Chinese troops and colonists. At the same time it was reported that Chinese troops were advancing into Mongolia. Many believed eventually that Outer and Inner Mongolia would be divided between Russia and Japan. On September 18 China decided that it would accept

the Russian proposals as to Outer Mongolia, but would resist aggression in Inner Mongolia. Early in October, Chinese troops were reported to have massacred large numbers of Mongolians to check the tendency to join Outer Mongolia.

TIBET. As a result of the revolution in China the garrison at Lhasa mutinied, and the amban abdicated. There were revolts among the natives elsewhere and in June the Dalai Lama returned to Lhasa. The Chinese government dispatched an expedition to Tibet, but was obliged to recall it under pressure from Great Britain. The latter government had sent a memorandum on August 17, warning China against the apparent design to turn nominal authority over Tibet into actual sovereignty, as violating the Anglo-Chinese Treaty of 1906. A force of Chinese troops, 2000 strong, were reported to have been ambushed in eastern Tibet early in October, but later to have fought their way out. Chinese successes were reported in Litang. A new province was officially proclaimed under the title of Hsikangseng and comprising western Szechwan and eastern Tibet.

THE OPIUM QUESTION. As noted in the preceding YEAR BOOK the agreement of 1907 between British and Chinese governments for the annual reduction of the imports of opium from India into China having expired in 1911, a new agreement was signed in May of that year providing that "the export of opium from India to China shall cease in less than seven years if clear proof is given to the satisfaction of the British minister at Peking of the complete absence of the production of native opium in China." The 1907 agreement looked to the extinction of the Indian opium trade with China in ten years. The trade in 1907 amounted to 51,000 chests and it was to be decreased by 5100 chests annually, subject, however, to China's discontinuance of the poppy cultivation to a corresponding extent. In 1911 the Indian trade had fallen to 31,016 chests and in 1912 it was placed at 21,260. Meanwhile according to the report of an expert employed by the British foreign office to investigate China's progress in carrying out her part of the agreement the decreases in poppy cultivation ranged from 75 per cent. in some of the provinces to less than 25 per cent. in others. After the renewal of the agreement in May, 1911, the disturbed political conditions greatly hindered the Chinese government in carrying out its programme for the suppression of opium production, and it was evident in 1912 that China was failing to curtail poppy cultivation to the extent stipulated by that agreement. The area of poppy cultivation was reported to have greatly increased and at the same time the provincial governments were refusing to admit Indian opium. Official British protests were made repeatedly against this one-sided state of affairs, but though the Chinese government gave assurances that the provincial authorities would be ordered to recall their restrictions on Indian opium there was little change in the situation. In October the British government informed the Chinese authorities that while allowance would be made for China's difficulties in the matter, the question of withdrawing from the agreement of May, 1911, might have to be reconsidered.

The International Conference, held at Shanghai, in 1909, at the invitation of the United States, passed the series of important resolutions, noted in our previous records, asking

the governments represented to pledge themselves to measures for the prevention of the abuse of opium. A second conference was held at The Hague, in December, 1911, and remained in session till January, 1912. It prepared a convention of twenty-five articles relating to the control of the production and distribution of raw opium and the gradual reduction of the manufacture and sale of prepared opium. The convention was signed by the representatives of the following powers: United States, Germany, France, China, Great Britain, Italy, Persia, Japan, The Netherlands, Russia, Portugal, and Siam. For recent books on China see *LITERATURE, ENGLISH AND AMERICAN, Travel and Contemporary History*. See also *ANTHROPOLOGY*.

CHINESE IMMIGRATION. See *IMMIGRATION AND EMIGRATION*.

CHISHOLM, HUGH J. An American capitalist, died July 8, 1912. He was born in Niagara-on-the-Lake, Canada, in 1847. When but thirteen years of age he became a train newsboy on the Grand Trunk Railway, at the same time studying in evening classes in the Business College of Toronto. He gradually secured control of news routes on the trains of the Grand Trunk road to Portland, Me. His business grew to great magnitude. He became interested in the wood pulp business and began the manufacture of indurated fibre. He later organized several large paper and pulp manufacturing companies, including the Rumford Falls Power Company. Here he established a community of model homes for mill operatives, known as Strathglass Park. He was one of the organizers of the International Paper Company and became its president in 1907. He was also president or director in various other important corporations.

CHOSEN. See *KOREA*.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. An interdenominational society for young people, founded in Portland, Me., in 1889. The conventions of the society are held biennially and no convention was held during 1912. No statistics for membership were gathered, but the membership for 1909 was about 4,000,000 in 79,077 societies. The next international convention will be held July 4-14, 1913, in Los Angeles, Cal. The officers of the society in 1912 were as follows: President, Francis B. Clark, D. D.; general secretary, William Shaw; editorial secretary, Amos R. Wells; treasurer, H. N. Lathrop; and interstate secretary, Karl Lehmann.

CHRISTIANS. This denomination reported in 1912, 104,027 communicants; 1203 churches; 1314 ministers. Each church is independent in its local affairs, but for the conduct of general work the churches and ministers are organized into conferences, and these are represented by delegates in the American Christian Convention, which meets once in four years. The convention has charge of the general enterprises of the church. It includes the Christian Publishing Association, the Mission Board of the Christian Church, which are incorporated bodies, and the departments of education, finance, Sunday school, and Christian endeavor. The publishing house prints books, tracts, and Sunday school literature, and issues the *Herald of Gospel Liberty*, the oldest religious paper in the United States. The Mission Board issues a monthly magazine, *The Christian Missionary*, and prosecutes missionary and church

extension work in Japan, Porto Rico, and continental United States. The denomination has eight colleges, one preparatory school, and one theological seminary. It maintains a home for aged ministers at Lakemont, N. Y., and an orphanage at Elon College, N. C.

CHURCH, ALFRED JOHN. An English clergyman and writer, died April 27, 1912. He was born in London in 1829 and was educated in King's College, London, and Lincoln College, Oxford. From 1857 to 1870 he was assistant master in Merchant Taylor's School, London, and from 1870 to 1872 was head master of Henley Grammar School. From 1873 to 1880 he was head master of Retford Grammar School. He was professor of Latin in the University College, London, from 1880 to 1888 and from 1892 to 1897 was rector of Ashley, Gloucestershire. He wrote many books, chiefly for boys. Among these are, *Stories from Homer, Virgil, Greek Tragedians, Livy, and Herodotus; Two Thousand Years Ago; Fall of Carthage*, etc. Other works include a book of reminiscences, *Memories of Men and Books* (1908). In collaboration with Rev. George A. Broadribb, he translated *Tacitus*.

CHURCH STATISTICS. See RELIGIOUS DENOMINATIONS.

CHURTON, EDWARD TOWNSON. Former Anglican bishop of Nassau, died May, 1912. He was born in 1841 and was educated at Eton, and at Oriol College, Oxford. He was ordained in 1886 and officiated as vicar at Charlton and at Dover. From 1886 to 1900 he was bishop of Nassau. He resigned the office in the latter year. Among his published writings are: *The Island Missionary of the Bahamas; The Missionary's Foundation of Christian Doctrine* (1890); *Retreat Addresses* (1893); *Sanctuary of Missions* (1898); *Foreign Missions* (1901), and *The Use of Penitence* (1905).

CITY PLANNING, or the art of laying out cities to serve the comfort, convenience, and higher aspirations of the public, is a thing of the twentieth century. True, there have been noble isolated examples of city planning scattered through the centuries and countries of the world, but not until within a few years past has city planning become a part of the national thought and life of any country, with the exception of Germany. In that country a school of city planners has existed for decades and has left its imprint in periodicals, in books, and to a considerable extent in the planning and replanning of cities. The cooperation of

German governing bodies with the most enlightened elements in the artistic and scientific circles of the empire has made Germany the world's leader in this field. The contrast is great with democratic nations like our own. For an interesting account of the conditions that make it possible for Germany and Austria to carry out far-reaching plans of municipal improvement see the article by Otto Wagner in the *Architectural Record* for May, 1912.

UNITED STATES. The first awakening to the aesthetic possibilities of city planning in this country dates from the World's Columbian Exposition in 1893. With the memory of that exposition and of other noble groupings of public buildings, and the arrangements of parks, water fronts, and monuments, as seen on visits to Europe, the architects and landscape architects of the United States began to see visions. Then came the revivification of the Washington-L'Enfant plan of our federal capital as a further stimulus. Soon civic associations throughout the country grasped the idea that cities should be planned instead of permitted to spread outwards and grow in a haphazard fashion. These bodies then began to employ landscape architects to report on improvements in their city plan. At this juncture too much stress was unfortunately laid on the aesthetics of city planning and the movement was handicapped by the widespread use of such terms as "the city beautiful." This term, together with the costliness of the new city plans often proposed, created more public opposition to than support of the new movement; all the more so because the public was thus led to believe that city planning was simply a costly aesthetic fad which must be denied until public improvements of a more solid and necessary kind had been secured. As a consequence, although city planning or improvement reports have been made for many cities of the United States, in a few cases at an expense of thousands of dollars, few cities have yet officially adopted any considerable part of the plans recommended. One reason for shelving or pigeon-holing so many carefully wrought plans, aside from the "city beautiful" handicap already mentioned, is that most of these reports and plans were made at the instance of voluntary organizations, having no official connection with the responsible city government.

Such radical changes as have been proposed stand little chance of being executed unless they originate with some municipal body or officer who is an integral part of the city government. Hartford, Conn., has an official City Plan Commission, which made its fifth annual report in 1912. Somewhat similar commissions were authorized by the New Jersey legislature in 1911, and one, for Newark, was created in that year. In addition, the Board of Public Works of Newark has a city planning engineer, who submitted a comprehensive report for street and park plan improvements in 1912. In Philadelphia there is a city planning engineer in the Bureau of Surveys. Los Angeles and a number of other cities now have city planning commissions. Cleveland, O., voted bonds in 1912 for a library, which will be the fourth building in its official group or civic centre scheme, worked out some years ago by a commission of consulting experts. San Francisco voted \$8,800,000 of bonds early in 1912 for a new city hall and to provide land for

a new civic centre. In December, 1912, a large popular majority declared in favor of the erection of an auditorium, library, opera house (at private expense), State building, and other structures in the civic centre, and at the same time an official city planning commission was authorized, the members to serve without pay. At Augusta, Ga., a plaza was projected in 1912, opposite the union passenger station; a proposed post office building and Carnegie library will flank the plaza on either side. In New York City a site for a new court house was chosen in 1912 which, it is hoped, will yet be a part of a new civic centre, including perhaps a post office, State office building, and possibly other structures. This site is only a short distance from the City Hall, Brooklyn Bridge, Hall of Records, and the large and monumental Municipal Office Building now under construction. In Pittsburgh the mayor has appointed a city planning commission and a municipal art commission. The Forest Hills (L. I.) "garden city" has advanced towards readiness for occupancy. A fine plan for the development of Seattle, prepared by Virgil Bague, was defeated by popular vote.

It will be noted that so far as actual construction work is concerned the specific examples thus far cited for the United States do not go beyond groups of public buildings or civic centres. Little else has yet been accomplished, except that a goodly number of cities have created or extended park and parkway systems and some have cut new or widened old streets in order to facilitate the movement of traffic.

City planning and replanning on a comprehensive scale has proceeded far on paper, but has not yet got much beyond it in the United States. It involves many complex problems and, oftentimes, huge expense. The solution of these problems and the meeting of the expense would be greatly aided if it were possible to apply in the United States what has been so successfully used in Europe, the principle of excess condemnation, or the taking of more land by the city than is needed for the specific improvement and the resale of the land at its enhanced value after the improvement has been made. There appears to be a strong belief in legal circles that excess condemnation has no warrant under the existing constitutions of most of our States, if indeed it would not be against the federal Constitution. In the absence of power to utilize excess condemnation much more might be accomplished than is generally undertaken by making use of the well-established principle of assessments for benefits, or the putting upon such real estate as is increased in value by street, park, and other improvements a large part of the expenditure involved. This policy was ably advocated by Nelson P. Lewis in a paper entitled "How to Pay the Bills for City Planning," read before the City Planning Conference held at Boston, Mass., in May, 1912. These conferences, it may be added, are perhaps contributing more largely than any other single activity to a solution of American city planning problems. They have been participated in from the start by building and landscape architects, engineers, housing reformers, sociologists, and city officials, and the four volumes of *Proceedings* may be consulted with profit. The conferences have been notable for the minor place which has

been given in them to æsthetic considerations, except as these grow out of the fitting of form to function. The physical or utilitarian, legal, and financial aspects of city planning and the intimate relations between city planning and housing reform have been the dominant features of the conferences. Another factor making for progress is the recent establishment of courses in city planning at a number of universities.

CANADA. In a general way Canada has shared in the city planning movement of the United States, responding to many of the same stimuli and taking a part in the work of propaganda and physical achievement. On May 4, 1912, an act of the Ontario legislature came into force which gives the Ontario Railway and Municipal Board power to pass on all plans for laying out vacant lands within the city of Toronto. All plans for outlying lands must conform to a general plan to be prepared by the city and which may cover the territory five miles in any direction from the city limits. No land development plan may be registered, nor any lots sold therefrom, until the plan has been approved by the board named. Some of the rapidly growing cities of the Canadian Northwest are alive to city planning and are taking advantage of the unique opportunity afforded by the fact that they are being created after the city planning movement was in full swing. Calgary, Alberta, has an official city planning commission, with a paid full-time secretary, and in 1912 invited competitive plans for a civic centre.

GREAT BRITAIN. Town planning (the current term there) in Great Britain owes its first great impetus to what has become widely known as the garden city movement, or the laying out of entirely new towns or town additions with a view to giving people of small and moderate incomes a chance to live in comfortable detached or semi-detached, or at best not over-large, two-storied tenement-houses, surrounded with garden plots. The street plan, open spaces, public buildings, and other elements of a well-planned city were all given proper attention. These garden cities were private undertakings and left untouched the replanning of built-up areas and also the planning of new areas where the land owners had no interest in progressive city planning.

In 1909 Parliament passed the housing and town planning act, which gave all municipalities large powers over city planning, more particularly as regards the laying out of new areas. These powers, however, are subject to the jurisdiction of a central body known as the Local Government Board. Under the act municipal authorities can, on approval of the board, lay out vacant land in accordance with a carefully planned scheme, which appears to be largely the work of the local town or borough engineering department. Up to November, 1912, 124 local authorities had schemes in various stages of progress. Birmingham had prepared and submitted to the board for approval plans for one area of 2320 acres and for another area of 1442 acres, and Rochdale had got equally far with an area of 43 acres. Apparently no final approvals had been made by the board up to November. A total of 17 applications, from 13 local authorities, had been granted to the extent of permission to prepare and submit schemes. A dozen or so other

applications for authority to prepare plans were awaiting action. Two of these, both involving rural districts, embraced nearly 6000 acres each. Altogether, the "schemes and proposals for schemes" before the board involved a total of more than 52,000 acres of land, not including a larger number of schemes in preliminary stages.

A summer school of town planning was held at the Hampstead Garden Suburb in August, 1912, under the auspices of the University of London. A second one will be held August 2-9, 1913. A scheme for a 400-acre extension to the suburb is now before the Local Government Board and adds to the attractiveness of this locality for summer school purposes.

The Surveying and Housing World (London) is a weekly journal which contains a large amount of news regarding British town planning projects, including reproductions of maps of new schemes. *The Town Planning Review*, published by the department of civic design, school of architecture, University of Liverpool, is a scholarly illustrated quarterly which contains essays and news articles and notes on city planning in Great Britain, on the continent of Europe, and in the United States and Canada.

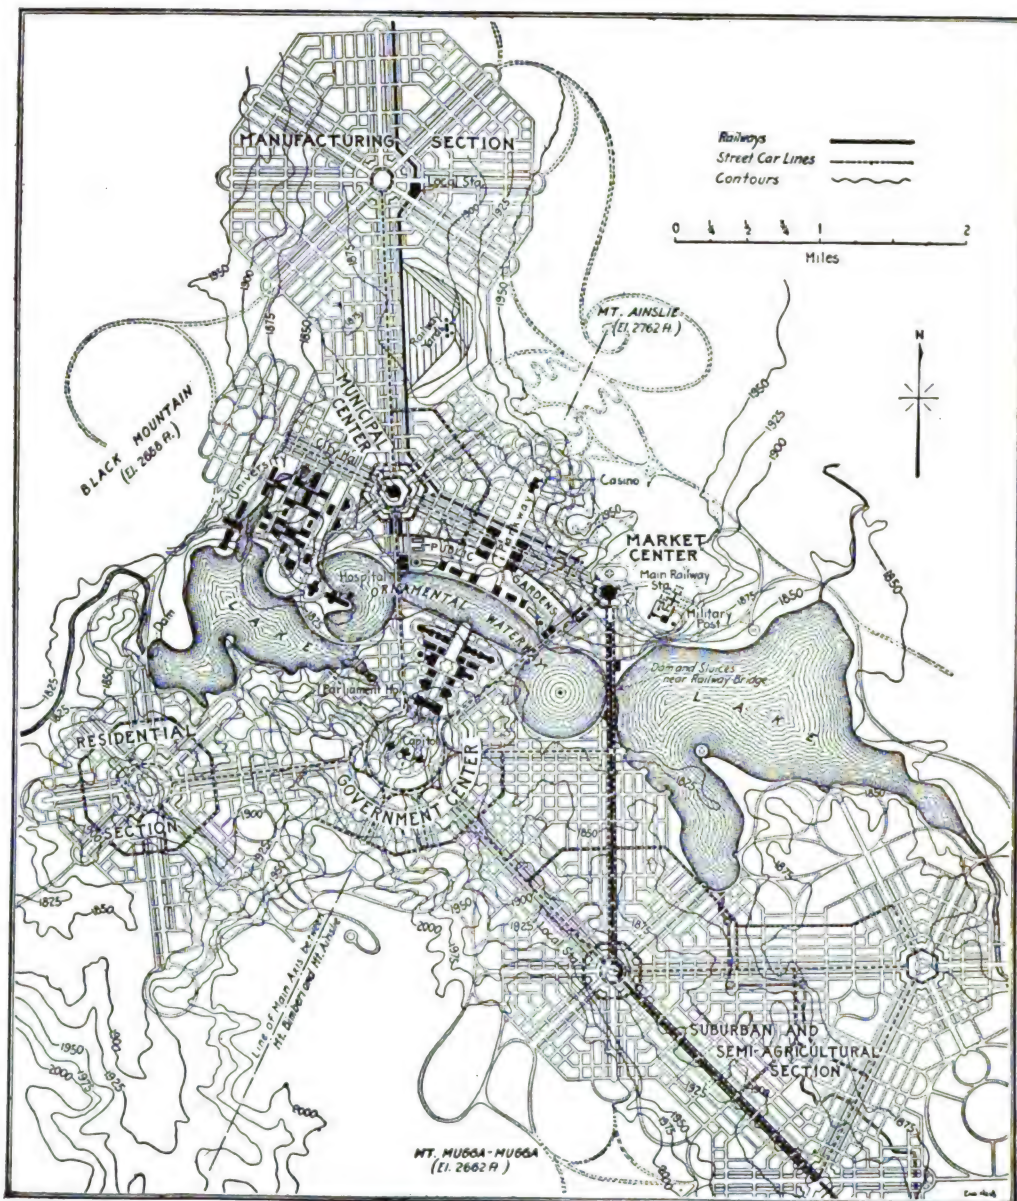

AUSTRALIA. Capital Competition. A notable event in city planning in 1912 was the award of prizes in the competition for a plan for the proposed new capital of the Australian Commonwealth. In a world-wide competition the first prize of £1750 (\$8500) was awarded to Walter Burley Griffin, architect and landscape architect, Chicago, Ill.; second prize of £750 to Eliel Saarinen, architect, Helsingfors, Finland; third prize of £5000 to Prof. D. A. Agache, architect, Paris, France. Honorable mention was made of plans submitted by Harold Van Buren Magonigle, architect, New York City, and of a London competitor. In a minority report it was recommended that the first prize should go to three collaborators of Sydney, N. S. W.; the second to Arthur C. Comey, landscape architect, Cambridge, Mass., and the third to a Swedish civil engineer and two collaborators. The premiated plans became the property of the government, to be used as it sees fit.

Competitors for the prizes were supplied with contour maps and photographic views of the site and its vicinity, a variety of local data, and a statement of the requirements to be met in the way of government buildings, streets, transportation, etc. As illustrating the scope of city planning in general, as well as of this competition, it may be noted that in examining each scheme submitted the judges considered the following main heads and a number of subheads not given: (1) General conditions, including location, width, and grades of roads; railways, tramways, fire-breaks, and "allocation of districts for specific purposes," as residences, etc. (2) Hygiene, including sewerage and drainage, sunlight and air facilities, prevailing winds, and aspect. (3) Architectural and general effect, including ornamental waters and parks. (4) Expansion, and (5) economy. (6) Miscellaneous, including places of amusement and sports, arboreal treatment, and factory buildings.

The site selected in 1908 for the new capital is located in the Yass-Canberra district of New South Wales in a federal district of 900 square

miles. The site has an area of five square miles, exclusive of suburbs, and is 170 miles southwest of Sydney, 300 miles northeast of Melbourne, and 170 miles from the east coast. The average elevation is 2000 feet above sea level, but the site includes mountain peaks, one of which is 6000 feet high. A sluggish stream named the Molonglo River flows through the site, and one of the suggestions to competitors was to provide attractive water areas by damming and diking this stream. A varied topography, an entire absence of either habitations or railways, and the general requirements laid down gave the competitors a remarkably free hand and a unique opportunity to apply all the latest and best principles of the art of city planning. How this was done by Mr. Griffin is shown, in part, by the accompanying general plan of the first premiated design, reproduced by permission from *Engineering News* of July 4, 1912, which contains a lengthy article on the first design, prepared with the cooperation of Mr. Griffin. It will be noted that the federal government centre is located on either side of an axial line which connects the summits of Mt. Ainslie, within the city, and Mt. Bimberi, 30 miles distant, the latter having an elevation of 6230 feet and therefore being a commanding feature in the distant landscape. An ornamental waterway lies in front of the main government buildings and across this are public gardens, from which leads a wide parkway. On quite another radial line, but at no great angle with the first, and across the ornamental waterway, is the municipal government centre, and beyond that is the manufacturing centre. On still other radial lines extending out from the government centre are the residential section and a large suburban and semi-agricultural section, both on the same side of the water as the government centre. The market centre is on yet another radial line, and close by it are the union railway station and the military post. The ornamental waterway is flanked on either hand by lakes of irregular size. The water areas as well as other features of the layout insure quiet and dignity to the government centre. A large group of university buildings occupies a choice location near the municipal centre. The plan as a whole is made up of a number of centres, polygonal in shape, from which extend radial lines of main communication. These lines, combined with the polygonal form of the centres, give rectangular city blocks and avoid the curved streets and triangular blocks incident to the radial-circumferential plan. The whole street plan is based on the assumption that local street railways will be provided to such an extent that necessary walking will be reduced to a few blocks in any direction. It will be noted that the steam railway also gives ready access to all parts of the city except the small residential section, presumably intended for high-cost houses, but that it is kept at a respectable distance from the government centre.

Those who have had the privilege of hearing Mr. Griffin explain his plans have been impressed with the careful analysis and synthesis displayed in his studies. He was born at Mayward, Ill., in 1876, and is a graduate of the University of Illinois. His professional work has been chiefly architectural, but he has done some previous town planning and landscape work on

FROM ENGINEERING NEWS. FIRST PREMIATED DESIGN FOR THE NEW CAPITAL CITY OF AUSTRALIA.
(Designed by Walter B. Giffin, Chicago, Ill.)

a small scale, including the planning of Idalia, Fla., and a design for a modern Shanghai, China.

In the Australian capital competition 137 separate designs were submitted, of which 11 were thrown out because of informalities. The 126 remaining designs were submitted by the minister for home affairs to a federal capital design board, consisting of J. M. Coane, as chairman, James A. Smith, and John Kirkpatrick, the two first named being engineers and the last one an architect. Mr. Coane made the minority report already mentioned. Both reports were published in the summer of 1912 as a public document of the commonwealth of Australia, consisting chiefly of photographic

reproductions of the designs selected by the majority and minority. The minister named approved the plans early in 1912, but in the August following word reached this country that he had appointed a departmental board to prepare an official plan based on the premiated designs and suggestions to be obtained from the unsuccessful designs as well. Unfortunately, the authorities refused to make the terms of the competition conform to the requirements of the British and Australian Institutes of Architects, with the result that no architect of note from either of the countries most directly concerned took part in the contest.

CIVIC FEDERATION, NATIONAL. The

annual meeting of the federation was held in Washington, on March 5, 6, and 7, 1912. Henry B. F. McFarland, former commissioner of the District of Columbia delivered the address of welcome, Cardinal Gibbons addressed the federation on industrial peace, and the annual address was given by the president, Seth Low. This was in general a review of the labor conditions. Other important addresses delivered were those on "Government Mediation in Railroad Labor Disputes," by M. A. Knapp, of the Interstate Commerce Commission; "The Case of the Federal Employee," by Samuel Gompers; "Pension for Federal Employees," by Franklin Mac Veagh, Secretary of the Treasury; "Civic Federation and the Trust Problem," by Talcott Williams.

The officers elected at the meeting in 1912 were as follows: President, Seth Low; vice-presidents, Samuel Gompers, Ellison Smythe, Benjamin Ide Wheeler; treasurer, Isaac N. Seligman; chairman of the executive council, Ralph M. Easley.

CIVIL SERVICE. FEDERAL CIVIL SERVICE. According to the figures compiled by the civil service commission in 1911, the total number of positions under the federal civil service in that year was 391,350. This total included 28,191 in the employ of the Isthmian Canal. The total number in the civil service in Washington was 33,811 and the total number outside of Washington 329,348.

Several important measures regarding federal civil service were taken in 1912. One of these was the action of President Taft in taking an important step toward bringing all government employees under the civil service on October 15, when he made the announcement that all fourth-class postmasters were to be placed under civil service rules and thus taken out of the "spoils system." In 1908, President Roosevelt placed under civil service rules the fourth-class postmasters of the States north of the Ohio and east of the Mississippi rivers. These numbered nearly 14,000. There still remained outside the civil service rules over 36,000. These are the postmasters who are included in President Taft's order. The result of the order promulgated by President Roosevelt was so satisfactory that about 20,000 fourth-class postmasters in the States south of the Ohio and west of the Mississippi signed a petition to be transferred to the merit system. President Taft had already put himself on record as advocating the inclusion in that system not only of the fourth-class postmasters, but all postmasters and all other federal officials, including collectors of customs, collectors of internal revenue, naval customs officers, surveyors, assayers, receivers, and public land agents. Legislation by Congress, however, is required to give the President power to add first, second, and third-class postmasters to the civil service list.

On December 7, 1912, the President by executive order placed in the classified service all artisan and supervisory artisan positions under the jurisdiction of the Department of the Navy. These positions numbered about 20,000.

In his message sent to Congress on December 3 President Taft renewed his previous recommendations to Congress for legislation making permanent the non-competitive system of appointment in the consular and diplomatic services. These now rest on executive order.

MUNICIPAL CIVIL SERVICE. On December 3, the voters of Los Angeles rejected by a large majority the new city charter, which contained the most advanced civil service provisions yet proposed in the United States. These placed practically every city official and employee, except elective officers and members of the civil service commission, within the classified service.

In San Francisco the jurisdiction of the civil service commission was increased and the merit system extended to include the county service by the adoption of an amendment to the city charter on December 10.

The National Civil Service Reform League held its annual meeting in Milwaukee, December 5 and 6, 1912. The principal address was delivered by President Charles W. Eliot. Other important papers read at the meeting were the "Competitive System for Higher City Officers," by Hon. William Dudley Foulke; "Methods of Removal in the Chicago and Illinois Services," by Mr. Robert Catherwood, and the "Illinois System of Removals in the Civil Service," by Hon. William B. Hale. See **MUNICIPAL GOVERNMENT**.

CLANCY, JOHN. An Irish Roman Catholic bishop, died October 19, 1912. He was born in Socey, county Sligo, in 1856, and was educated at the Marist Brothers' School and afterwards at St. Patrick's College, Maynooth. From 1883 to 1895 he was professor of rhetoric and English literature in Maynooth College. He was consecrated bishop of Elphin in the latter year.

CLANCY PROCESS. See **METALLURGY**.

CLARK, CHAMP. See **PRESIDENTIAL CAMPAIGN**.

CLARKE, WILLIAM NEWTON. An American scholar and educator, died January 15, 1912. He was born in Cazenovia, N. Y., in 1841, and graduated from Madison, now Colgate University, in 1861. He studied theology at the Hamilton Theological Seminary, graduating in 1863. In the same year he was ordained to the Baptist ministry and became pastor at Keene, N. H. He occupied several pastorates in the years following, including churches at Newton Centre, Mass., and Montreal. In 1883 he was appointed professor of New Testament Interpretation at the Toronto Baptist College. From 1887 to 1890 he was pastor at Hamilton, N. Y. In the latter year he became professor of Christian theology at Colgate University and in 1908 was appointed professor of ethics and apologetics in the same institution. He was the author of *Commentary on the Gospel of Mark* (1881); *Outline of Christian Theology* (1898); *What Shall We Think of Christianity?* (1899); *A Study of Christian Missions* (1900); *The Christian Doctrine of God* (1909), and *Sixty Years with the Bible* (1909).

CLARK UNIVERSITY. An institution established originally for post-graduate work, in Worcester, Mass., in 1889. It includes, in addition to other departments, a collegiate department. The number of students enrolled in the several departments of the university in the autumn of 1912, was 90, and the faculty numbered 24. There were no noteworthy changes in the faculty during the year and no important benefactions were received. The endowment, including that for the collegiate department, amounts to \$3,973,800. There were about 60,000 volumes in the library. President, G. Stanley Hall, Ph. D., LL. D.

CLAYTON-BULWER TREATY. See *PANAMA CANAL.*

CLAY-WORKING INDUSTRIES. The two main divisions included under the heading clay-working industries are the manufacture of brick and tile, and of pottery. In 1911, while there was a decreased value in the product of brick and tile, pottery showed an increase. The total value of the product of the clay-working industries in 1911 was \$162,236,181, compared with \$170,115,974 in 1910. The decrease in value of the brick and tile industry was \$8,613,675, and the increase in the value of the pottery industry was \$733,882. In the brick and tile industry decreases were shown in both the quantity and value of common brick, in the quantity of vitrified paving brick, in the value of fancy or ornamental brick, in the quantity and value of fire brick and in the value of drain tile and architectural terra-cotta. Increases were recorded in the value of vitrified paving brick and some other varieties of special brick. A decrease in the common brick output may be partly accounted for by the increased use of hollow brick or tile for the construction of large buildings and even of dwelling houses. The leading State in the value of the clay-working industries is Ohio, which ranked first among the States in 1911, with a product valued at \$32,663,895. The brick and tile product was valued at \$17,888,630, and the pottery at \$14,776,265. Pennsylvania ranked second, with a product valued at \$20,270,033; New Jersey, third, with a total value of \$18,178,228; Illinois, fourth, \$14,330,014; New York, fifth, \$10,184,376. Other States in the clay-working industries which had a large value were California, Georgia, Indiana, Kansas, Kentucky, Missouri, and West Virginia. All the States produced clay products of some value.

The total value of the imports of clay products in the United States in 1911 was \$10,804,749 (pottery of all kinds, \$10,638,616; brick, \$166,133). The imports in 1910 were valued at \$11,353,341. The exports in 1911 were valued at \$3,665,720 (brick, \$2,264,354; pottery, \$1,401,366).

CLEAVES, HENRY BRADSTREET. An American public official, former governor of Maine, died June 22, 1912. He was born in Bridgeton, Me., in 1840, and received an academic education. He enlisted in the Civil War in the 23d Maine Infantry, and after the expiration of his term of enlistment reenlisted in the 30th Maine Infantry. He was promoted through various non-commissioned grades to the rank of first lieutenant. He returned to Bridgeton at the close of the war and studied law. In 1868 he was admitted to the bar, practicing in Portland. In 1876-77 he was a member of the State legislature. He was city solicitor of Portland in 1877, and from 1880 to 1885 was attorney-general of the State. During his service in this office he was instrumental in securing the passage by the legislature of the right to levy a franchise tax upon railroad and telegraph corporations. He was elected governor of the State in 1892, and was reelected in 1894.

CLOUSTON, SIR EDWARD SEABORNE. A Canadian financier and philanthropist, died November 23, 1912. He was born in Moose Factory, Canada, in 1849, and was educated in the schools of Montreal. He entered the bank of Montreal in 1865, and rising through various grades became in 1890 general manager of that bank. He was governor of McGill University, Royal Victoria Hospital, Montreal General Hospital, and the Western Hospital in the same city. He was president of the Canadian Bankers' Association, and director of the Art Association of Montreal. He was created a baronet in 1908.

COAL. The total coal production of the United States in 1911 was 496,221,168 short tons, valued at \$626,366,876. Of this amount, 80,771,488 long tons, equivalent to 90,464,067 short tons, was anthracite. The production in 1911 showed a decrease from 501,596,378 short tons in 1910. The decrease may be attributed entirely to the depressed condition of the iron and steel trade in 1911. This was reflected in the decreased production of coke. The total decrease in the production of bituminous coal was 11,354,041 short tons. More than half this decrease was made up by the increase in the production of anthracite in Pennsylvania, which showed a gain of 5,388,242 long tons.

Coal was produced in thirty States and the Territory of Alaska in 1911, but in four, Idaho, Nevada, Alaska, and North Carolina, the aggregate output was less than 3000 tons. Of the ten States in which the production increased, only two, Pennsylvania and Virginia, are eastern States. The chief decreases were in the coke production States and in those States which profited by the strike of 1910.

For amount of production in the various States, see articles on States.

MINERS EMPLOYED. The total number of men employed in the coal mines of the United States in 1911 was 722,335, of whom 172,585 were employed in the anthracite mines of Pennsylvania, and 549,750 in the bituminous and lignite mines. The coal mining industry as a whole was not disturbed by serious labor troubles in 1911. In the bituminous regions, where operations are conducted under agreements with the Mine Workers' Union, the compacts extend from April 1 to March 31 of the "even" years. In the "odd" years, as in 1911, the difficulties are local and generally short-lived. In the anthracite region or Pennsylvania operations were conducted without serious interruptions under the second three-year extension of the awards of the Strike Commission.

COAL MINING ACCIDENTS. Statistics of accidents in the coal mines and in other branches of the mining and quarrying industry in 1911 were compiled under the direction of the director of the United States Bureau of Mines. These returns show that 2719 men were killed in the coal mines in 1911, a decrease from 2840 in 1910. The most prolific cause of accidents was falls of roof and coal, 1321 deaths, or 48.6 per cent. of the total. In only two States, Alabama and Tennessee, were deaths from explosions of dust and gas more numerous than those from falls. The total deaths from explosions was 371. Mine cars and haulage

motors killed 303. Premature blasts and powder explosions killed 134, and 63 men met their deaths in shaft accidents. The death rate per thousand employees was 3.76.

COAL CONSUMPTION. Practically the entire output of both anthracite and bituminous coal in the United States is consumed within the country. The total quantity of coal exported in 1911 was 19,524,653 short tons. The consumption of coal of domestic production was 476,696,485 tons. Imports in 1911 amounted to 1,385,956 tons. The quantity of coal consumed in the manufacture of coke at the mines in 1911 was 42,217,167 short tons.

WORLD PRODUCTION OF COAL. The world's production of coal in 1911 was 1,303,763,496 short tons. Of this the United States produced 38.1 per cent. Great Britain produced 304,518,927 short tons; Germany, 258,223,763 short tons; Austria, 43,375,550; France, 25,570,053; Belgium, 25,490,842. Other countries producing more than 10,000,000 tons were Japan, China, and India. The figures for these three countries as well as for Austria-Hungary are for 1910.

PRODUCTION IN 1912. The production of coal in the United States in 1911-12 is given in the table below which is taken from the *Engineering and Mining Journal*. It will be noted that there was in 1912 a largely increased production over 1911. Nearly all the large producing States had increased production. This applies to bituminous coal. The figures for anthracite coal show a decreases of 6,000,000 tons.

States	1911 Short tons	1912 Short tons
Bituminous:		
Alabama	15,040,267	18,500,000
Arkansas	1,950,300	2,120,000
California	5,000	2,500
Colorado	10,197,535	11,306,968
Georgia	165,320	150,000
Illinois	50,336,559	(b) 57,685,700

COKE. The most striking feature in connection with the making of coke in the United States in 1911 was that while the total production of retort and oven coke decreased, the number of retort or by-product ovens increased over 10 per cent., and the increase in the number of these ovens in operation was larger than in any year since their operation in the United States, except the increase of 1904 over 1903. The decrease in the production of coke was largely the result of the depression in the iron trade. The total production in 1911 was 35,551,489 short tons, valued at \$84,130,849, the smallest output in both quantity and value, except in the panic year 1908, since 1905. It may be compared to the production of 1910, which was 41,705,810 short tons, the largest production in any one year. The value of the product in 1910 was \$99,742,701. The average price in 1911 was \$2.37, as compared with \$2.39 in 1910.

The production in 1911 included 27,703,644 tons of oven coke, valued at \$56,832,952, and of 7,847,845 tons of retort or by-product coke, valued at \$27,297,897. In 1910 the production of oven coke was 32,570,876 tons and that of retort or by-product coke was 7,138,734 tons. Thus, while the output of oven coke decreased 6,866,432 tons that of by-product coke increased 709,111 tons. The coal consumed in the manufacture of coke in 1911 amounted to 53,278,248 short tons, valued at \$64,112,084. As the value of the coke produced was \$84,130,489, the difference between the value of the coal used and the coke produced, \$20,018,765, less the cost of manufacture, expense of administration, etc., represented the profit on the coke-making operations. The total number of ovens in operation in 1911 was 103,879 compared with 104,440 in 1910. Of the 103,879 ovens in existence at the close of 1911, 40,399 were idle throughout the year. The number of ovens idle in 1910 was 8373. The number of ovens in blast during the whole or parts of 1911 was 63,480, of which 59,160 were beehive or partial combustion ovens, and 4320 were retort or distillation ovens. At the close to the year there were 2254 ovens in the course of construction. Of these, 698 were by-product recovery ovens. Counting each bank of ovens as a separate establishment, there were in 1911, 570 establishments, against 578 in 1910. In 1911, 19 plants were abandoned

and dismantled and 10 new ones were constructed.

Of the States producing coke, Pennsylvania stands first. The production in 1911 was 21,923,935 short tons. There were in the State 279 establishments making coke, and 54,904 ovens. Alabama ranks second as a producer of coke, the product in 1911 amounting to 2,761,521 short tons, from 44 establishments with 10,121 ovens. West Virginia ranked third, with 2,291,049 short tons, and 138 establishments, with 19,876 ovens. Other States producing coke in large quantities are Colorado, New York, Virginia, Tennessee, Ohio, and Kentucky. The statistics of production in these States will be found in the paragraphs *Mineral Production* under them.

BY-PRODUCTS OF COKE. As mentioned above, the manufacture of by-products of coke is each year increasing in importance. The total value of these products from the manufacture of coke in retort ovens in 1911 was \$10,033,961, or a little more than one-third of the value of the coke produced. The by-products recovered in 1911 consisted of 33,274,861,000 feet of surplus gas, 69,410,599 gallons of tar, 72,920,056 pounds of ammonium sulphate or its equivalent, 23,180,118 pounds of anhydrous ammonia, and 4,660,596 gallons of ammonia liquor.

The imports of coke in the United States in 1911 amounted to 77,923 short tons, valued at \$234,455, compared with 172,716 tons, valued at \$625,130, in 1910. The exports amounted to 102,383 short tons, valued at \$3,215,990.

The production of coke in the United States in 1912 is shown in the table below. The figures are those of the *Engineering and Mining Journal*. There was a considerable increase in the output in 1912.

	Short tons		Short tons
Alabama ..	2,050,000	Pennsylvania	28,492,275
Colorado ...	969,638	Tennessee ...	345,000

COLD STORAGE. See STOCK-RAISING AND MEAT PRODUCTION, and FOOD AND NUTRITION.

COLGATE UNIVERSITY. An institution of higher learning at Hamilton, N. Y., founded in 1819. The total enrollment in 1912 was 408 for the college and 54 in the theological seminary. The faculty numbered 44. A noteworthy event during the year was the creation of the office of vice-president, which was filled by Professor M. S. Read. There were no important benefactions received during the year. The productive funds of the college amounted to about \$2,000,000 and the income to about \$150,000. The volumes in the library numbered 61,000. President, Elmer Burritt Bryan.

COLLEGES. See UNIVERSITIES AND COLLEGES.

COLLEGES, AGRICULTURAL. See AGRICULTURAL EDUCATION.

COLLINS, LOREN WARREN. An American jurist, died September 27, 1912. He was born in Lowell, Mass., in 1838. In 1854 he removed to Minnesota and served throughout the Civil War in the 7th Minnesota Regiment, and was

brevetted captain for gallantry in service. After the war he studied law and was admitted to the bar. He was for ten years county attorney of Stearns County, Minn. He was a member of the State legislature from 1881 to 1883. In the latter year he was appointed judge of the 7th judicial district of Minnesota. In 1887 he was appointed associate justice of the supreme court of the State. He resigned this position in 1904.

COLLISIONS. See RAILWAY ACCIDENTS.

COLLYER, ROBERT. A Unitarian clergyman and writer, died November 30, 1912. He was born in Keighley, Yorkshire, England, in 1823. As a youth he worked for nine years as a blacksmith in Yorkshire and the greater part of his early education was acquired by reading from books which were propped up on the forge before him. Previous to his working as a smith he had been put, at the age of 8, at work in a cotton-mill, where his experiences enabled him in later years to write effectively against child labor. At the age of 18 years he had versed himself sufficiently in the principles of Wesleyanism to be able to fill the pulpit in the local Methodist Church. When he was 27 years of age he removed to the United States. He worked at his early trade of blacksmith near Philadelphia for nine years, after which he went to Chicago as a preacher. During these years he had experienced a theological change. The principles of Methodism became incompatible to him and he joined the Unitarian Church. As a minister in this denomination he worked among missions in Chicago and finally took charge of Unity Church in 1860. He remained in this pastorate for nineteen years. His work following the great fire in Chicago added greatly to his reputation and to the esteem in which he was held in that city. He combated the idea that the fire was a Divine retribution and inspired the people of the stricken city with new energy. In 1879 he was called to the pastorate of the Church of the Messiah in New York City, and it is in this church that he always considered that the chief work of his life had been done. He remained in the active performance of the duties of pastor until he was well past 70, although he had several times offered to resign in favor of a younger man. In 1903 he was made pastor emeritus of the church. Dr. Collyer served in the Civil War as a nurse. He was one of the most striking figures in the life of New York City. He took an active and at times an aggressive part in philanthropic and charitable enterprises and he was notably effective as a speaker even in his last years. In 1910 he accepted the degree of D. D. from the Meadville Theological College. He had up to this time refused this degree on the ground that he was not a college graduate. Dr. Collyer's published works included: *Nature and Life* (1864); *The Life That Now Is* (1871); *The Simple Truth—A Home Book* (1878); *Talks to Young Men* (1888), and *Things New and Old* (1893).

COLOMBIA. A northwestern republic of South America. Capital, Bogotá.

AREA, POPULATION, ETC. On account of unsettled boundaries in the southeast, there are various estimates of area, ranging from 435,100 to 465,700 square miles. According to data reported from the national census board, the population on March 4, 1912, was 5,031,-

850. It was stated that this figure did not include the inhabitants of the recently established commissaries of Vapues, Putumayo, and Caquetá or the uncivilized Indians in some of the remote forests. Reported population in 1912 of towns over 18,000; Bogotá, 121,257; Medellín, 71,004; Barranquilla, 48,907; Cartagena, 36,632; Manizales, 34,720; Sonsón, 29,346; Pasto, 27,760; Cali, 27,747; Aguadas, 26,423; Ibagué, 24,693; Palmira, 24,312; Neiva, 21,852; Montería, 21,521; Yarumal, 21,250; Cúcuta, 20,364; Bucaramanga, 19,755; Miraflores, 19,150; Loricá, 19,005; Popayán, 18,724; Cartago, 18,628; Pereira, 18,428; Andes, 18,391; Salamina, 18,195; Fredonia, 18,176. Primary instruction is gratuitous but not compulsory. There are several normal schools and a few establishments for professional education. Pupils and students attending 3877 institutions in 1900 were reported at 239,987.

INDUSTRIES AND COMMERCE. The people are engaged chiefly in agriculture and mining. In portions of the country cattle-raising is important. Leading products include bananas, coffee, cacao, sugar-cane, cotton, rubber, and cereals. There are large mineral resources, especially in Antioquia, including copper, lead, zinc, mercury, iron, platinum, and salt. The famous emerald mines of Muzo are leased by the government to an English syndicate. Manufactures are little developed.

Imports and exports have been valued as follows:

	1908	1909	1910	1911
Imp'ts	\$13,513,892	\$12,117,927	\$17,025,637	\$18,108,863
Exp'ts	\$14,998,744	\$16,340,198	\$17,625,153	\$22,375,799

The leading imports include flour, cotton goods, sugar, petroleum, iron and steel manufactures, and lard. Principal exports in 1911: Coffee, \$9,475,448; gold, \$3,751,632; bananas, \$2,172,000; hides, \$1,779,790; Panama hats, \$1,088,821; rubber, \$900,886; ivory nuts, \$739,419; platinum, \$345,896; tobacco, \$332,935. Over half the total exports go to the United States.

COMMUNICATIONS. The railways form no continuous system but consist of various short lines engaged in local traffic. The total length at the end of 1911 was reported at 1000 kms., and extensions on several lines were under way. The railways in 1911 transported 1,350,548 passengers and 383,930 tons of freight; the gross receipts were \$2,758,281. Telegraph, 19,062 kms. of line. Post offices, about 500.

FINANCE. The gold dollar, or peso, is equivalent to the United States dollar, the silver peso fluctuates with the price of silver, and the paper peso is legally current at one cent. The budget for 1910 balanced at \$10,831,500; for 1911, revenue \$9,570,500, expenditure \$10,831,500; for 1913, each \$12,500,000. Of the estimated 1913 receipts, customs were placed at \$8,250,000; mines and salt, \$1,636,000; stamps, \$400,000; posts and telegraphs, \$410,000. Estimated expenditure for the ministry of war, \$2,661,379; public debt, \$2,551,554; interior, \$1,264,515; posts and telegraphs, \$1,029,681; finance, \$1,070,591. The foreign debt is reported at \$2,666,400 (also the government guarantees railway bonds, £492,000, and interest on railway bonds, £1,480,000); internal debt (1910), \$3,290,169. There is an enormous outstanding paper currency.

GOVERNMENT. The president is elected by the Congress for a (constitutional) term of four years and is assisted by a cabinet of seven ministers. The Congress is composed of the Senate (35 members elected indirectly) and the House of Representatives (92 members elected by direct vote). The president in 1912 was Carlos E. Restrepo, elected July 15 and inaugurated August 7, 1910. First and second designados (vice-presidents), Marco Suárez and José María González Valencia, respectively.

The United States vice-consul, William B. MacMaster, died under circumstances indicating violence, and the United States government ordered an investigation. Attempts had several times been recently made on his life and his relations with Colombian officials had been strained. The investigation brought out facts tending to prove that he had been murdered.

COLON, MUNICIPAL IMPROVEMENTS IN. See PANAMA CANAL.

COLORADO. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population in 1910 of 799,024, the foreign-born whites numbered 126,851, compared with 90,475 in 1900. The largest number, 17,070, came from Germany; from Italy, 14,368; from Russia, 13,610; from Austria, 13,153; from Sweden, 12,445; from Canada, 8727; and from Ireland, 8709. Other European countries were represented by smaller numbers. The negroes in the State in 1910 numbered 11,453 and the mulattoes 3638. In 1890 the negroes numbered 6215 and the mulattoes 2159.

MANUFACTURES. The Thirteenth Census included statistics of manufactures in the State. These are for the calendar year 1909 and were compiled in 1912. The general results will be found in the table below. The industries in which the largest capital is invested are those connected with slaughtering and meat packing, the value of whose products was \$9,657,000. The wage earners employed in these industries numbered 659. Second in value of production were flour-mill and grist-mill products, \$7,868,000; printing and publishing, \$6,962,000, giving employment to 2366 wage earners. The largest number of wage earners were employed in the industries connected with cars and general shop construction. These numbered 3993. The value of the product of these industries was \$6,559,000. The only other industries whose product was valued at more than \$5,000,000 were those connected with foundry and machine shop products. The value of these was \$5,907,000. The wage earners in the State in 1909 numbered 28,067, of whom 25,957 were male and 2110 were female. The wage earners under 16 years of age numbered 165, of whom 16 were females. The prevailing hours of labor for more than one-half the wage earners employed ranged from 54 to 60 a week. Of the total number of wage earners 22.7 per cent. were employed in establishments where the prevailing hours were less than 54 a week, and 22.9 per cent. in establishments where the prevailing hours were more than 60 a week. There are only four cities in the State in which manufactories are important: Denver, with 12,058 wage earners and the value of the manufactured product in that city was \$51,538,547. In Pueblo were 1320 wage earners, in Colorado Springs, 516, and in Trinidad, 220. The following table shows the growth of manufactures

in the five-year period, 1904 to 1909, together with the percentage of increase:

	Number or amount. 1909	of inc. 1904	P. C. 1904-1909
Number of establishments	2,034	1,606	26.6
Persons engaged in manufactures	34,115	25,888	31.8
Proprietors and firm members	1,722	1,398	23.2
Salaried employees	4,326	2,677	61.6
Wage earners (average number)	28,067	21,813	28.7
Primary horsepower	154,615	124,901	23.8
Capital	\$162,668,000	\$107,664,000	51.1
Expenses	114,690,000	88,282,000	29.9
Services	25,560,000	18,649,000	37.1
Salaries	5,648,000	3,549,000	59.1
Wages	19,912,000	15,100,000	31.9
Materials	80,491,000	63,114,000	27.5
Miscellaneous	8,639,000	6,519,000	32.5
Value of products	130,044,000	100,144,000	29.9
Value added by manufacture (value of products less cost of materials)	49,553,000	37,030,000	33.8

MINERAL PRODUCTION. The production of gold in 1911 was valued at \$19,001,975, a decrease of \$1,505,083 from the output of 1910. The production of Cripple Creek, which in 1911 was \$10,562,653, decreased \$439,600. The output of Ouray county decreased \$242,889, following a decrease of \$848,978 in 1910. Of the total ore mined and sold or treated, dry or siliceous ores made up 79 per cent. and yielded \$17,907,034 of the gold, or 94 per cent. of the total gold output. Nearly 2 per cent. came from placer mines and nearly 2 per cent. from lead ores, the remainder of the gold production being derived from copper, zinc, and lead-zinc ores. The total output of the placer mines of the State in 1911 was \$319,759. The silver production of the State in 1911 was 7,330,168 fine ounces against 8,509,598 ounces in 1910. Leadville showed a decrease of 314,719 ounces and yielded 41 per cent. of the State output in 1911. Dry or siliceous ores yielded 5,096,026 ounces in 1911, or nearly 70 per cent. of the total output; lead ores, \$1,265,594; lead-zinc ores, \$476,049; copper ores, \$342,550, and the small remainder came from copper-lead and zinc ores.

The production of copper in the State in 1911 was 9,791,861 pounds, as compared with \$9,307,497 pounds in 1910. The State ranks ninth among copper-producing States. The total recorded output from the beginning of the industry is 213,543,924 pounds. The main production of the metal is derived from the treatment of mixed ores, in which copper is of minor importance. These included lead-silver ores and pyritic ores rich in gold and silver.

COAL. The production of coal in the State in 1911 was 10,157,383 short tons, valued at \$14,747,764. Colorado is the principal coal-producing State west of the Mississippi River and ranks seventh among all the States. The production in 1910 was the maximum in the history of coal mining in the State, 11,973,736 short tons. The decreased production in 1911 was due to an unusually mild winter in 1910-11, the decreased consumption of locomotive fuel and the resumption of mining in the coal-producing States of the Mississippi Valley.

The number of men employed in the coal mines of the State in 1911 was 14,273.

PETROLEUM. There were produced in 1911, 226,926 barrels of petroleum, compared with 239,794 barrels in 1910. The largest production was in the Florence field, 187,341 barrels. From the Boulder fields were obtained 37,973 barrels.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown in the following table.

		Acreage	Prod. Bu.	Value
Corn	1912	420,000	8,736,000	\$ 4,368,000
	1911	373,000	5,222,000	4,073,000
Wheat	1912	453,000	10,968,000	8,006,000
	1911	438,000	8,274,000	6,950,000
Oats	1912	290,000	12,412,000	4,717,000
	1911	297,000	10,150,000	4,872,000
Rye	1912	25,000	488,000	268,000
	1911	21,000	252,000	176,000
Potatoes	1912	85,000	8,075,000	3,311,000
	1911	90,000	3,150,000	3,118,000
Hay	1912	870,000 (a)	1,905,000	16,574,000
	1911	707,000 (a)	1,414,000	16,150,000

(a) Tons.

EDUCATION. The total school population of the State between the ages of 6 and 21 in 1912 was 227,187. Of these 114,589 were male and 112,598 female. The total enrollment in the schools was 177,428. Of these, 89,932 were male and 87,426 were female. The enrollment in the high schools of the State was 16,377, the enrollment in -grade schools below high schools was 112,582, and the enrollment in rural schools was 48,469. The average monthly salary for male teachers was \$102.45 and for female teachers, \$69.01. The disbursements for school purposes in 1912 were as follows: For teachers' salaries, \$3,836,166; for current expenses, \$1,232,254; for sites and building improvements, \$1,262,794; for library purposes, \$13,252; for redemption of bond, \$203,758; for interest on bonds, \$183,099. The Superintendent of Education recommends for legislative enactment measures making the term of office of State and county superintendents four years. Recommendation is also made for a law for the medical examination of school children by specialists and trained nurses.

FINANCE. The report of the State treasurer for the biennial period ending November 30, 1912, showed a balance in the treasury on December 1, 1910, of \$3,309,320. The receipts for the two-year period were \$8,237,900 and the disbursements amounted to \$7,383,035, leaving a balance in the treasury on December 1, 1912, of \$4,164,195. The chief source of revenue was from taxation. The principal expenditures were for education and the support of State institutions.

CHARITIES AND CORRECTIONS. The charitable and correctional institutions under the control of the State included the Boys' Industrial School, the Dependent Children's Home, the Insane Asylums, Home for the Mute and Blind, Soldiers' and Sailors' Home, and the State Penitentiary and Reformatory.

POLITICS AND GOVERNMENT

The legislature did not meet in 1912 as the sessions are biennial and the last was held in 1911.

CONVENTIONS AND ELECTIONS. The Republican State convention which met on March 26

elected delegates to the national convention pledged to President Taft, who had about 700 delegates, and there were about 200 for Mr. Roosevelt. The Democratic State convention for the election of delegates sent delegates pledged to Governor Wilson. On August 1, the Progressive party convened at Denver and chose a complete State ticket headed by E. P. Costigan. In the primaries on September 10, C. C. Parks was nominated as Republican candidate for governor. The Democrats nominated as their candidate for governor, E. M. Ammon. In the election held on November 5, Wilson received 114,223 votes; Taft, 58,386; Roosevelt, 72,306; and Debs, 16,418 votes. In the contest for governor, Ammon, the Democratic candidate, received 101,293 votes, Costigan, Progressive, 63,035, and Parks, Republican, 54,724. The Democrats elected all the Congressmen, including two Congressmen-at-large.

A number of important measures were voted upon. These included a measure prohibiting the sale of intoxicating liquors, a measure regulating the employment of women, and an act establishing a public service commission. These measures were all presented under the laws providing for initiative and referendum. In addition, a number of other amendments to the constitution were voted upon, but these were relatively unimportant.

On May 21 one of the most closely contested municipal elections ever held in Denver, resulted in the election of Henry J. Arnold as mayor. Mr. Arnold headed the Citizens' ticket. He was opposed by a Republican candidate, United States Marshal D. C. Bailey, and a Democratic candidate, John B. Hunter. Mr. Arnold's plurality was over 20,000.

STATE GOVERNMENT. Governor, E. M. Ammon; Lieutenant-Governor, B. F. Montgomery; Secretary of State, James B. Pearce; Treasurer, M. A. Leddy; Auditor, R. Kenahan; Attorney-General, Fred Farrar; Superintendent of Public Instruction, Mary C. Bradford, all Democrats.

JUDICIARY. Supreme Court: Chief Justice, George W. Musser, Dem.; Justices, S. H. White, Dem.; W. A. Hill, Dem.; M. S. Bailey, Dem.; William H. Gabbert, Rep.; Tully Scott, Dem.; James E. Garrigues, Rep.; Clerk, James R. Killian, Dem.

STATE LEGISLATURE, 1913. Democrats, Senate, 24; House, 48; joint ballot, 72. Republicans, Senate, 11; House, 17; joint ballot, 28. Democratic majority, Senate, 13; House, 31; joint ballot, 44.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

COLORADO, UNIVERSITY OF. A State institution of higher education at Boulder, Col., founded in 1876. The total enrollment in the several departments of the university in the year 1911-12 was 1306. The faculty numbered 217. Among the important events in the history of the university during the year were the establishment of a school of social and home service, inauguration of the university extension department, and the appointment of Loran Osborn, Ph. D., as director, the establishment of an electrical testing laboratory, and the appointment of a research assistant in charge, the establishment of a school of pharmacy, the establishment of a hygienic laboratory, and the appointment of Dr. A. R. Peebles

as professor of preventive and experimental medicine. For the establishment of the electrical testing laboratory there was given the sum of \$10,000. The income of the university is \$250,000 annually. There are 63,487 volumes in the library.

COLORATION. See ENTOMOLOGY.

COLOR PHOTOGRAPHY. See CHEMISTRY, INDUSTRIAL.

COLUMBIA, DISTRICT OF. See UNITED STATES.

COLUMBIA UNIVERSITY. The total number of students receiving instruction in all departments of the university in the autumn of 1912 was 9002. Of these, 3602 were in attendance at the summer session of 1912. The remainder, 6148, were distributed in the different departments of the college as follows: Columbia College, 819; Barnard College, 590; college of architecture, 129; college of music, 20; schools of mines, engineering and chemistry, 634; school of law, 457; school of journalism, 336; school of pedagogy, 1045; school of pharmacy, 420; school of practical arts, 227; graduate school (non-professional), 1399. In addition, there are enrolled in extension and similar courses, 1741 students. Among the changes in the faculty during the collegiate year 1911-12 was the retirement of John W. Burgess, Ph. D., professor of political science and constitutional law, and dean of the faculty of political science, philosophy and pure science, and fine arts. Professor Burgess was the oldest professor on the rolls of the university. George N. Olcott, associate professor of Latin, died on March 3, 1912. Note of the establishment of the school of journalism and other items of interest in the administration of the university during the year will be found in the article on UNIVERSITIES AND COLLEGES.

COLUMBUS, O. See SEWAGE PURIFICATION.

COMAN, HENRY BENJAMIN. An American jurist, died January 10, 1912. He was born in Morrisville, N. Y., in 1858, and was educated in the public schools and at the Cazenovia Seminary. After studying law he was admitted to the bar in 1880. Until 1890 he was clerk in the office of the surrogate in Madison county. He afterwards took up private practice and in 1899 received an appointment to the office of the attorney-general in Albany. In the year following he was appointed deputy attorney-general with the special assignment to enforce the franchise tax law. He became first deputy attorney-general in 1901 and in 1902 was defeated for the office of attorney-general on the Republican ticket. In 1907 he was appointed justice of the supreme court of the State.

CONGO, BELGIAN. A central African colony of Belgium (the former Congo Free State). Boma (Bas-Congo) is the capital. All the statistics given below are from the official report of the Belgian colonial minister.

AREA AND POPULATION. The colony covers (January 1, 1912), an area of 2,365,000 square kilometers (913,127 square miles); white population, 4003 (2432 Belgians). No official estimate of native population is given; other sources vary from nine to twenty millions. Besides Boma, important towns are Matadi, Banana, Leopoldville, Stanleyville, Kambove, Niangara, Bandundu, etc.

PRODUCTION. The chief products of the country are shown in the list of exports, rubber leading in importance. The Kilo gold mine, situated in the Ituri basin, not far from Lake Albert, has 8 experts and 1750 negro workers, and produced (1910) 876 kgs. of gold.

Sale of crown lands in 1910, about 14 hectares at a total price of 241,528 francs; crown lands rented in 1910, 4062 hectares, rental 18,345 francs. A large proportion of these lands is in the Katanga district.

COMMERCE. Total imports (general trade) in 1910, 43,979,000 francs; special trade, 36,846,508. Exports, details and totals for four years, are shown below (general trade), with values in thousands of francs:

Articles	1907	1908	1909	1910
Rubber	57,330	40,144	60,171	76,080
Palm oil	1,741	1,376	1,095	2,016
Palm nuts	2,622	2,066	2,199	3,101
Ivory	11,084	9,597	10,364	9,361
Various	4,914	3,694	4,195	5,091
Total exports....	77,541	56,867	78,014	95,599

Exports, special trade (1910), 66,602,298 francs (rubber, 51,015,649; ivory, 6,056,475; palm nuts, 2,657,164; raw gold, 2,514,922; palm oil, 1,797,594; white copal, 1,314,348; cacao, 1,071,372; etc.). The principal countries of origin and destination are in the order named, Belgium, Great Britain, France, Germany, Netherlands, Angola, Denmark, Portugal, Uganda, etc. Tonnage entered and cleared (1910), 627,997.

RAILWAYS. On January 1, 1912, the various railway lines, with holdings, were as follows: Congo Railway Company, 400 kilometers; Stanleyville-Ponthierville, 125; Kindu-Kongolo, 355; Lualaba-Tanganika, 300 (approximate length under construction); Rhodesian frontier-Elisabethville and Elisabethville-Bukama, 275 in operation and 168 under construction; Boma-la Lukula, 80.

FINANCE AND GOVERNMENT. Financial sta-

tistics appear in the table below in thousands of francs for four years (1911 and 1912 budgets):

	1909	1910	1911	1912
Revenue	34,570	33,517	40,870	45,368
Expenditure	34,470	40,371	*59,658	†66,539
* Including 12,222,443 francs extraordinary.				
† 16,818,660 francs extraordinary.				

The total public debt amounts to 214,909,700 francs.

The governor-general in 1912 was F. Fuchs.

HISTORY. In the closing weeks of 1911 a serious insurrection broke out in an extensive portion of the Welle district, where the Walendu massacred a large part of the natives who were loyal to the whites. A body of troops some 300 strong were hurried into the region and very severe repressive measures were taken. In June the various societies and agencies that were concerned with the improvement of the Congo presented to Sir Edward Grey a memorandum, which, while admitting that many improvements had been introduced in the administration since Belgium assumed control, asserted that the native races were still as insecure as ever as regards the ownership of land. They had no lands, according to Belgian law, outside the arbitrarily assigned boundaries of their villages. This status had already been admitted by the British government to be contrary to the spirit of the treaties that define the international position of the Congo State. It was therefore the government's right to press for measures that would insure security of tenure for the natives. Congo reformers felt much alarm at the proposal of Belgium to establish vast state rubber plantations for revenue purposes. When questioned on this subject, M. Renkin, the Belgian minister for the colonies, declared that the government had not decided to carry this out on a large scale, but was considering whether it should not reduce the number of plantations instead of increasing them, and should conduct such enterprises as remained in its hands chiefly as examples for the benefit of private enterprise. It was required that every laborer's contract should be countersigned by a legislator. There were instances of abuse and the government was trying to reduce them to the minimum.

CONGO FREE STATE. See CONGO, BELGIAN.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGREGATIONALISTS. The Congregationalists are the eighth largest religious body in the United States. Congregationalism in its churches is found in their relation to each other, under—first, a group of churches in annual session, which is called, "Association"; second, all the churches of a State meeting annually, called "Conference"; third, a National Council, the constituency of which is formed by delegates in triennial sessions from associations and conferences. The chief organization, under the auspices of which the benevolent and missionary work of the churches is carried on, are: The American Board of Commissioners for Foreign Missions; the Congregational Education Society; the Congregational Church Building Society; the Congrega-

tional Home Missionary Society; the American Missionary Association; the Congregational Sunday School and Publishing Society; the Congregational Board of Ministerial Relief; the Woman's Foreign Mission Boards, and the Woman's Federation and Auxiliaries for Home Missionary Work. For fellowship, culture, and inspiration, clubs are maintained, of which there are about fifty in the United States. A license to preach is granted in some States by local associations, and in other States by ministerial associations.

The theological seminaries known as Congregational are Yale (undenominational), opened in 1822; Bangor, Me., 1816; Andover, Cambridge, Mass., 1807; Hartford, Conn., 1834; Oberlin, Ohio, 1835; Chicago, Ill., 1855; Pacific, Berkeley, Cal., 1869; Talladega, Ala., 1872; Atlanta, Ga., 1901. In these institutions are 392 undergraduates, and 127 instructors. Forty colleges were founded by Congregationalists; in these are enrolled 22,962 students. The instructors number 2030. In their libraries there are 1,862,491 volumes. The amount of productive funds is \$37,553,224.55. On January 1, 1912, Congregationalists reported 738,861 members in the United States. At that date there were reported 6048 churches, and 6116 ministers. The Sunday schools enrolled 664,629 members. For home expenses the amount was \$9,356,122. The total of contributions was \$2,454,340, which was distributed as follows: Foreign missions, \$518,325; education, \$59,311; church building, \$81,315; home missions, \$346,593; American Missionary Association, \$144,190; Sunday school work, \$66,703; ministerial aid, \$36,935; additional Congregational work, \$523,513; undenominational, \$677,455. World-wide Congregationalism, 14,424 churches and chapels; 1,389,882 members, and 1,550,799 members in Sunday schools.

The National Council was organized at Oberlin, Ohio, November 17, 1871. This body as well as local and State bodies does not legislate for the churches. It is simply advisory. Whatever of wisdom there is in its resolutions and recommendations is readily accepted by the churches. There is a tendency toward centralization, especially in missionary and benevolent service. That a greater efficiency might be secured a commission on apportionment of beneficence was created at Boston, 1910, with a view to developing a systematic method of gathering and assigning the contributions of the churches for missionary service. Ministerial and religious education is receiving a large consideration, the object being to advance the intellectual culture of the ministry, to elevate the standard, and to cultivate a more scientific understanding and application of biblical literature and teaching, especially in the interest of the young. The commission of nineteen, appointed at Boston, 1910, will report to the next session of National Council, recommending—that the National Council meet once in two years; that delegates to the council serve for two successive sessions; that the moderator be elected at the end of each session; that the committee on nominations be made permanent; that the council nominate a majority of the corporation members of the American board; that the delegates to National Council constitute a voting body in the in-

terest of home and foreign benevolence; that a home board of missions be created as a uniting bond between the home societies, whose board of managers shall coördinate and supervise the work of the missionary organization at home; that the secretaryship be enlarged in its functions.

The fifteenth triennial session of National Council will be held in Kansas City, Mo., October 22-31, 1913. The officers are: Moderator, Rev. Nehemiah Boynton, D. D., Brooklyn, N. Y.; secretary and editor, Rev. Asher Anderson, D. D., Boston, Mass.; treasurer and registrar, Rev. Joel S. Ives, Hartford, Conn.

CONGREGATIONAL METHODIST CHURCH. There were in this denomination in 1912, 15,229 communicants, 333 churches, and 337 ministers. In general, the polity of the church agrees with that of the Methodist Episcopal Church. Its greatest strength is in the Southern States. A publishing house is maintained at Ellisville, Miss. The official organ of the denomination is *The Messenger*. The only educational institution under the auspices of the denomination is the Atlanta Bible School.

CONGRESS OF APPLIED CHEMISTRY, INTERNATIONAL. See METALLURGY.

CONGRESS OF HYGIENE. See HYGIENE, CONGRESS OF.

CONGRESS OF JURISTS. See ARBITRATION, INTERNATIONAL.

CONGRESS OF THE UNITED STATES. See UNITED STATES.

CONNECTICUT. POPULATION. According to the Census Bureau statistics issued in 1912, of the total population in 1910 of 1,114,756 the foreign-born whites numbered 328,759 compared with 237,396 in 1900. The largest number, 58,456, came from Ireland; from Italy, 56,946; from Russia, 54,095; from Germany, 31,122; from Austria, 24,762; from England, 22,417, and from Sweden, 18,195. In the city of Bridgeport, with a population of 102,054 in 1910, the foreign-born whites numbered 36,180. In New Haven, with a population of 133,605, they numbered 42,784. In 1910 the negroes in the State numbered 15,174, and the mulattoes 3746. In 1890 the negroes numbered 12,302, and the mulattoes, 3081.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	60,000	3,000,000	\$ 2,310,300
	1911	59,000	2,862,000	2,375,300
Oats	1912	11,000	338,000	166,000
	1911	11,000	386,000	216,000
Rye	1912	7,000	122,000	112,000
	1911	8,000	148,900	138,000
Potatoes ..	1912	23,000	2,461,000	1,920,000
	1911	23,000	1,955,000	2,053,000
Hay	1912	379,000	(a) 436,000	9,813,000
	1911	490,000	(a) 539,000	12,666,000
Tobacco ..	1912	17,500	(b) 29,750,000	7,170,000
	1911	17,000	(b) 27,625,000	5,663,125

(a) Tons. (b) Pounds.

MANUFACTURES. The Thirteenth Census statistics are for the calendar year 1909 and were compiled in 1912. Connecticut is pre-

eminently a manufacturing State, and the growth and concentration of its population have been closely related to the increase and importance of its manufacturing industries. This State ranks twelfth in value of its manufactured products. The table below gives a summary of the results of the census:

	Number or Amount 1909	Amount 1904	P. C. of Inc. 1904-9
Number of establishments	4,351	3,477	22.3
Persons engaged in manufactures....	233,871	198,046	18.1
Proprietors and firm members...	3,468	2,918	18.8
Salaried employees	19,611	13,523	45.0
Wage earners (average No.)....	210,792	181,605	16.1
Primary horsepower.	400,275	304,204	31.6
Capital	\$517,547,000	\$373,284,000	38.6
Expenses	429,904,300	328,610,000	30.8
Services	135,756,000	104,983,000	29.8
Salaries	25,637,000	17,040,000	50.5
Wages	110,119,000	87,943,000	25.2
Materials	257,259,000	191,302,000	34.5
Miscellaneous	36,889,000	32,325,000	14.1
Value of products..	490,272,000	369,082,000	32.8
Value of products less cost of materials..	233,013,000	177,780,000	31.1

In addition it may be noted that of the 4251 establishments, 403 were devoted to foundry and machine shop products, 393 to lumber and timber products, 431 to bread and other bakery products, and 363 to printing and publishing. The value of the brass and bronze products in 1909 was \$66,933,000; of foundry and machine shop products \$65,535,000; of cotton goods, including cotton small wares, \$24,232,000. All these products showed a marked increase in the period of 1904-1909. The total number of persons engaged in manufactures in the State in 1909 was 233,871. Of these, 176,478 were male, and 57,393 were female. The number of wage-earners under 16 years of age was 5421. The great majority of wage-earners in the State employed in the manufacturing industries worked from 54 to 60 hours a week; only 8.4 per cent. of the total number being employed in establishments where the prevailing hours are less than 54 a week. The chief manufacturing city is Bridgeport, where 25,775 wage-earners were employed; second is New Haven, with 23,547, followed by Waterbury, 20,170, Hartford, 14,627, and New Britain, 13,513.

EDUCATION. The school children in the State, in 1912, numbered 255,652. The enrollment in the public schools was 197,852 and the average daily attendance, 155,735. There were 1455 schools and 5491 teachers. The average monthly salary of women teachers was \$57.87. The total expenditure for schools during the fiscal year was \$6,122,367, of which \$3,250,671 was expended for teachers' wages.

FINANCE. The receipts for the fiscal year 1912 amounted to \$9,915,417, which includes \$4,000,000 of bonds sold during the year. The expenditures during the same period were \$8,105,750, including \$1,450,000, which was paid for a temporary loan. The balance on hand at the end of the fiscal year amounted to \$1,809,667. The chief receipts were from taxation of railroads, from State taxation, and from the inheritance tax. The chief expenditures were for the courts, for education, for the maintenance of highways, for the militia, and for the

support of humane institutions. The State debt amounts to \$7,064,100.

POLITICS AND GOVERNMENT

There was no session of the State legislature in 1912 as that body meets biennially and the last session was held in 1911. Elections were held for governor and other State officials on November 5. The Republican State convention for the election of delegates to the national convention met in New Haven on April 17. The four delegates-at-large and a majority of the ten district delegates were instructed to vote for President Taft. The entire delegation did vote for him at Chicago. The four delegates-at-large were: Charles F. Brooker, national committeeman, Charles Hopkins Clark, J. Henry Roraback, chairman of the Republican State committee, and Frank B. Weeks, former governor. Mr. Brooker was chosen chairman of the delegation. The Democrats at their convention for the election of delegates to their national convention, held May 1 and 2 at Bridgeport, pledged the votes of Connecticut to Governor Baldwin. The four delegates-at-large were: W. O. Burr of Hartford, Bryan F. Mahan of New London, William Kennedy of Naugatuck, and David E. Fitzgerald of New Haven. Mr. Kennedy was chosen chairman. The delegation voted for Governor Baldwin at Baltimore several times, and then scattered. The first State convention of the Progressive party was held on July 30 at Hartford. Forty-nine delegates to Chicago were chosen. Resolutions were adopted instructing the Connecticut delegation to vote for Mr. Roosevelt at the convention of the Progressive party, also in favor of direct primaries in National and State elections, presidential primaries for delegates to the national convention, election of United States Senators by direct vote, the initiative, referendum and recall and other measures advocated by the party.

On September 11 the Republicans met at Hartford in State convention for the nomination of governor and other State officers, and an entirely new ticket was put in the field, headed by Judge John P. Studley of New Haven, as candidate for governor, who was nominated over Dr. George H. Knight of Salisbury and Judge Silas A. Robinson of Middletown. Their platform, among other things, called for home rule for cities, a workmen's compensation act, and a commission for the improvement of agricultural conditions. On the following day the Democrats held their convention for the nomination of State officers in the same hall, and Governor Baldwin was re-nominated. Their platform called for the initiative and referendum, direct primaries, popular election of Senators, workmen's compensation and home rule for cities. The Progressive party met in convention on September 26 and nominated for governor Herbert Knox Smith, former commissioner of corporations. In the election on November 5, Governor Wilson received 74,561 votes, President Taft 68,324, Mr. Roosevelt 34,129, Debs, Socialist, 10,056 and Chafin, Prohibition, 2096. The vote for governor was: For Baldwin, 78,264; for Studley, 67,531; for Smith, 31,020; for Beardsley, Socialist, 10,236, and for Bossette, Prohibition 2096. The Democrats elected representatives to Congress in all five districts.

Augustine Lonergan of Hartford, defeated Charles C. Bissell of Suffield, in the first; Bryan F. Mahan of New London, defeated William A. King of Windham, in the second; Thomas F. Reilly of Meriden (re-elected), defeated John Q. Tilson of New Haven, in the third; Jeremiah Donovan of Norwalk, defeated Ebenezer J. Hill of Norwalk, in the fourth, and William Kennedy of Naugatuck, defeated State Comptroller Thomas D. Bradstreet of Thomaston, in the fifth. Mr. Bradstreet had been nominated to succeed Dr. George H. Knight of Salisbury, who fell dead on the platform while addressing a Republican convention at his own home early in the campaign. The previous Congressional delegation had stood four Republicans and one Democrat. The State legislature stands: Senate, 21 Democrats, 14 Republicans; House, 130 Republicans, 120 Democrats, 6 Progressives, and 2 Progressive Republicans; total, 258. No United States Senator is to be elected this year. A constitutional amendment adopted since the last session requires the regular legislative session, which opens on the Wednesday after the first Monday in January, to terminate by the first Wednesday after the first Monday of June in the same year. The session of 1911 lasted from January 5 until September 20.

STATE GOVERNMENT. Governor, Simeon E. Baldwin, Dem.; Lieutenant-Governor, Lyman T. Tingier, Dem.; Secretary of State, Albert L. Phillips, Dem.; Treasurer, Edward S. Roberts, Dem.; Attorney-General, John H. Light, Rep.; Commissioner of Insurance, Burton Mansfield, Dem.

JUDICIARY. Supreme Court: Chief Justice, Frederick B. Hall, Rep.; Associate Justices, S. O. Prentice, Rep.; George W. Wheeler, Dem.; John M. Thayer, Dem.; Alberto T. Roraback, Rep.; Clerk, George A. Conant, Rep.

STATE LEGISLATURE, 1913. Republicans, Senate, 21; House, 120; joint ballot, 141. Democrats, Senate, 14; House, 132; joint ballot, 146. Progressives, House, 6; joint ballot, 6. Republican majority, Senate, 7. Democratic majority, House, 6.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

CONNELL, RICHARD E. A member of Congress from New York, died October 30, 1912. He was born in Poughkeepsie, N. Y., in 1857 and was educated in parochial and public schools in that city. He engaged in newspaper work as a reporter and from 1891 to the time of his death was editor of the *Poughkeepsie News-Press*. He was active in Democratic politics and from 1892 to 1894 was police commissioner of Poughkeepsie. He was elected to the 62d Congress in 1911. In 1900 he was a delegate to the Democratic national convention at Kansas City.

COOLIDGE, JOHN BACON. An American chemist and dentist, died February 5, 1912.

He was born in 1821. As a boy, he learned the shoemaker's trade, at the same time studying medicine and dentistry. After the Civil War he opened a dental office in Boston, afterwards taking a degree at the New York Medical College. He was the first dentist in the United States to use nitrous oxide gas as an anesthetic. He gave an exhibition of the use of this gas in 1864. With Dr. Weatherby, a Boston dentist, he established the Boston Dental College in 1867. This later was merged with the Tufts Dental School. In this school Dr. Coolidge was secretary for fifteen years, and for 27 years was professor of chemical dentistry and dental art mechanism. He invented many of the instruments now in use by modern dentists.

COOPER, PHILIP HENRY. A rear-admiral, retired, of the United States navy, died December 29, 1912. He was born in Camden, N. Y., in 1844 and graduated from the United States Naval Academy in 1863. He was appointed ensign in the same year and served on the *Constellation* until 1865. He participated in the battle of Mobile Bay and in the siege of Fort Morgan. He was executive officer of the *Richmond* at the surrender of the ram, *Webb*, on the Mississippi River. From 1865 to 1867 he served on the *Pouchatan*. He was instructor in the United States Naval Academy in 1868-69. In 1870-71 he took part in the Tehuantepec surveying expedition. After commanding several vessels he was appointed superintendent of the Naval Academy in 1894, serving until 1898. He took part in the Spanish-American War as commander of the *Chicago*. In 1902-3 he was superintendent of the second naval district and in 1903 was squadron commander of the Asiatic Station and commander-in-chief of this station in 1904. He retired in that year.

COÖPERATIVE CREDIT SOCIETIES.

COÖPERATIVE MARKETING. See HORTICULTURE.

COPPER. In the following article the production of copper is dealt with as a whole. The statistics of production in the several States will be found in the paragraph *Mineral Production* under those States. The statistics are those gathered by the United States Geological Survey.

The production of copper in 1911 by smelters from copper-bearing material from the United States was 1,097,232,741 pounds, valued at \$137,154,092 as compared with 1,080,159,509 pounds, valued at \$137,180,257 in 1910. The production in 1911 was the largest in the history of the industry, surpassing that of 1910 by about 1.5 per cent. The increase in the production in 1911 was due chiefly to the entrance of new producers into the field, as several of the older districts made smaller productions, the decrease generally being due to curtailment on account of the unsatisfactory condition of the copper metal market. The average price of copper for the year, 12.5 cents a pound, was slightly below that of 1910 and was the lowest yearly average price since 1902. Near the close of the year, however, the price of copper was notably better, the average for December being 13.71 cents a pound. The market conditions continued to improve until the average price for 1912 rose to about 17 cents per pound, the highest price since the

panic of 1907. Among the new companies which contributed to the output in 1911 were the Miami Copper Company, Arizona, the Ray Consolidated Copper Company, Arizona, the Chino Copper Company, New Mexico, and the Bonanza mine of the Copper River district, Alaska. The production from the Yerington district, Nevada, began early in 1912. Several of the older districts voluntarily curtailed their output and there was a material reduction in the Shasta County, Cal., district on account of the "smelter fume" difficulties. During the year 44 copper-smelting and refining plants treated material from the United States. Of these, 39 were domestic plants and five were foreign. Three were in British Columbia and two in Mexico.

Twenty-one States and Territories contributed to the copper production of 1911. The three leading States, Arizona, Montana, and Michigan, produced 72 per cent. of the total output in 1911 as compared with 74 per cent. in 1910, while the six leading States, including Utah, Nevada, and California, produced over 90 per cent. of the total output in 1911 as compared with over 96 per cent. in 1910. Arizona continued in 1911 to be the largest producer of copper. There were mined in that State 306,141,538 pounds, compared with 297,491,151 pounds in 1910. This was the largest production in the history of copper mining in the State. Montana ranked second with 272,847,705 pounds, compared with 284,808,533 pounds in 1910. Michigan, the third State in rank, produced in 1911, 219,840,201 pounds as compared with 222,683,461 in 1910. In Utah were produced 146,960,827 pounds in 1911 compared with 127,597,072 pounds in 1910. In Nevada 67,377,518 pounds were produced, compared with 64,359,398 pounds in 1910. In California were produced 36,316,136 pounds compared with 48,700,756 pounds in 1910. The production in Alaska showed a remarkable increase. In 1911 the production was 27,267,878 compared with 4,241,689 pounds in 1910. The table below shows the production of copper by States in the years 1910-1911 in pounds:

State	1910	1911
Alaska	4,311,026	22,314,889
Arizona	297,250,538	303,202,532
California	45,760,203	35,835,651
Colorado	9,307,497	9,791,861
Idaho	6,877,515	4,514,116
Michigan	221,462,984	218,185,236
Montana	283,078,473	271,814,491
New Mexico	3,784,609	2,860,400
Nevada	64,494,640	65,561,015
Oregon	22,022	125,943
South Dakota	43	1,607
Utah	125,185,455	142,340,215
Washington	65,021	195,533
Wyoming	217,127	130,499
Eastern States and unapportioned	18,342,359	20,358,791
Total	1,080,159,509	1,097,232,749

YIELD OF COPPER FROM ORES. There were mined in 1911 29,944,942 tons of copper, copper-lead, and copper-zinc ores. This ore contained 1,095,716,597 pounds of recoverable copper, or an average of 1.826 per cent., as compared with 1.88 per cent. for 1910. In 1911 copper ores produced 1,095,131,104 pounds of copper, and the copper-lead and copper-zinc ores produced 585,179 pounds. There were 4,-

355,650 tons of smelting ore, which yielded 407,570,198 pounds of copper, and 25,632,585 tons of concentrating ore which yielded 687,560,906 pounds. The highest grade of ore was produced in Alaska, where the average yield was 19.77 per cent. copper.

CONSUMPTION AND USES. The apparent consumption of refined new copper in the United States in 1911, was 681,700,000 pounds, as compared with 732,400,000 pounds in 1910. Adding to this 214,207,000 pounds of secondary copper and copper in alloys produced during the year, it gives a total of 895,900,000 of new and old copper which was available for domestic consumption. While no systematic attempt was made in 1911 to ascertain the proportion of the copper output used in the industries, some idea may be gained from the form in which the output of the refineries was cast. The following table shows the approximate quantity of copper cast and the different forms during 1911:

Forms in which cast	Total	Percent-age
Wire bars	731,029,349	50
Ingot and ingot bars	409,786,682	29
Cakes	143,716,125	10
Cathodes	135,499,770	9
Other forms	25,774,328	2
Total	1,445,836,254	100

EXPORTS AND IMPORTS. The imports of copper in unmanufactured form into the United States in 1911 were 334,604,538 pounds. The largest quantity was brought from Mexico. Other large exporters to the United States were Peru, Canada, Spain, and Great Britain. The exports of metallic copper from the United States in 1911 amounted to 786,553,208 pounds. Of this the largest amount was taken by the Netherlands, 230,693,649. Germany followed with 190,428,008 pounds; France, 135,038,893 pounds; and Great Britain, 108,061,603 pounds.

WORLD PRODUCTION. The world production of copper in 1911 was 1,958,201,285 pounds, compared with 1,903,297,003 in 1910. In 1911 the smelter output of the United States was 56 per cent. of the world's production, as compared with 56.75 per cent. in 1910. The following table, compiled by Henry R. Merton & Co., Ltd., showed the world's production by countries in 1910-11, with the figures reduced to pounds. The official figures for the production of the United States and Canada are inserted.

The production of copper in the United States in 1912 was 1,242,836,024 pounds, a slight increase over the production of 1911. The production in the copper-producing States in 1912 will be found in the following table, taken from the *Engineering and Mining Journal*. There was a remarkable increase in production in Alaska, also substantial increases in Arizona, Michigan, and Montana. Utah had a decreased production, as did California:

State	In Pounds	State	In Pounds
Alaska	33,600,000	Nevada	81,816,000
Arizona	357,773,708	New Mexico	26,174,000
California	29,867,430	Utah	186,372,157
Colorado	6,800,000	Washington	1,233,009
Idaho	5,038,000	East and South	18,915,616
Michigan	231,629,486	Other States	4,492,623
Montana	309,125,000		
Totals.....1,242,836,024			

(Copper extracted from ore or contained in the ore produced.)

Countries	1910	1911
Germany	55,335,460	49,162,580
England	1,102,300	1,102,300
Italy	7,275,180	5,731,960
Norway	23,368,760	20,943,700
Austria	4,850,120	5,511,500
Russia	50,044,420	57,319,600
Sweden	4,409,200	4,409,200
Spain and Portugal...	112,655,060	116,843,800

Total Africa	33,950,840	38,139,580
Japan	102,954,820	123,237,140
Australia	90,388,600	93,695,530
Grand total	1,903,297,003	1,958,201,285

The world production of copper in 1912 was 1,004,844 metric tons, according to the figures compiled by the *Engineering and Mining Journal*. In this compilation the figures are based upon crude copper, that is, the smelters' production. The production in the copper-producing countries in 1912 is given in the following table:

Country	Met. Tons	Country	Met. Tons
United States.....	563,747	Japan	54,000
Mexico	71,982	Russia	35,900
Canada	33,577	Germany	23,000
Cuba	4,000	Africa	20,000
Australasia	46,100	Spain and Portugal.....	58,000
Peru	27,600	Other countries.	31,000
Chile	35,938		
Totals.....	1,004,844		

COPYRIGHT. A copyright convention between the United States and Hungary was signed at Budapest, on January 30, 1912; ratifications were exchanged on September 16, and the convention went into effect on October 16. It provided that authors who are citizens or subjects of one of the two countries, or their assigns shall enjoy in the other country the same rights for liberty, artistic, dramatic, musical, and photographic works as are enjoyed by the natives. On July 1, the British copyright law, which was described in the preceding YEAR BOOK, went into effect. During the fiscal year ending June 30, 1912, the registrations in the United States numbered 120,931, of which 29,286 were for books, 22,580 for periodicals, 26,777 for musical compositions, 17,639 for pictorial illustrations, and 13,498 for photographs.

CORA INDIANS. See ANTHROPOLOGY.

CORBETT, JAMES FRANCIS. Roman Catholic bishop of Sale, Victoria, died May, 1912.

He was born in Limerick, Ireland, in 1840, and was educated in France. For several years after his admission to the priesthood he devoted himself to missionary duties in Limerick and was for many years secretary to the Roman Catholic archbishop of Melbourne. He was consecrated first bishop of Sale at St. Kilda in 1887.

CORDIALS. See LIQUORS.

CORN. The corn crop of the world in 1912 was estimated at 4,371,055,000 bushels, as compared with 3,461,093,000 bushels in 1911 and with 3,757,591,000 bushels, the average production for the five years 1906-1910. Of the 24 countries reporting yields, 15 are corn-surplus countries, the leading ones given in the order of their importance being the United States, Argentina, Hungary, British India, Rumania, and Russia, which produce about 95 per cent. of the world's annual crop. The corn importing countries which also produce this cereal are France, Austria, Italy, Switzerland, Spain, and Portugal, and while in some of these countries the production is small the annual yield of Italy ranks with that of Hungary. The large crop of the United States in 1912 and the satisfactory yields in other leading corn-producing countries brought the world's production for the year well above the average. In many sections of southeastern Europe the crop suffered from adverse climatic conditions which depressed both yield and quality. In the entire corn-growing region of Europe, except in Italy and Turkey, where drought proved injurious, the corn crop was retarded by cool, cloudy weather and by continued heavy rains, which in addition to reducing the yield prevented to a large extent the proper ripening of the late varieties and an adequate drying of the ears so that they might be stored with safety against heating and moulding. In some sections the entire plant was used from the fields as forage in order to save as much of the crop as conditions would permit. In Italy, where drought injured all cereals, corn was the best crop of the year, but the yield was below the average annual production of the country. The Turkish crop was also reduced by drought, but the total yield was nearly normal. The yields of Rumania, Bulgaria, and Austria were below the yields secured in 1911.

In the United States a late spring delayed planting and poor seed corn in some parts resulted in an unsatisfactory stand, but in general during the summer conditions were so favorable that the crop made an excellent growth. Suitable weather in September hastened maturity, and when towards the close of the month killing frosts occurred over a large portion of the corn belt the injury done was much less than had been expected. Although the early frosts gave rise to a considerable quantity of soft corn of poor storing quality, the production of sound and marketable grain was far greater than in any previous year. The total production was placed by the Department of Agriculture at 3,124,746,000 bushels, and the area devoted to the crop at 107,083,000 acres, as compared with 2,531,488,000 bushels grown on 105,825,000 acres in 1911. This was by far the largest crop ever produced and the first time the three-billion bushel mark was passed. The yield represented about three-fourths of the entire world's production. The bountiful harvest evidently had the effect of

lowering the market price, for the farm value per bushel on December 1, 1912, was only 48.7 cents, as compared with 61.8 cents on December 1, 1911. On this basis the total value of the immense crop was \$1,520,454,000, which was surpassed by the corn crop values of 1908 and 1911. The acreage of corn in 1912 was also the highest on record. The average yield per acre was reported as 29.2 bushels, as against 23.9 bushels the preceding year, and the highest since 1906. The best yields by States were the following: Iowa, 432,021,000 bushels; Illinois, 426,320,000 bushels; Missouri, 243,904,000 bushels; Indiana, 199,364,000 bushels; Nebraska, 182,618,000 bushels; Ohio, 174,410,000 bushels; Kansas, 174,225,000 bushels; Texas, 153,300,000 bushels; Kentucky, 109,440,000 bushels, and Oklahoma, 101,878,000 bushels. Illinois had an acreage of 10,658,000 and Iowa of 10,047,000 acres, while Missouri, ranking next, had only 7,622,000 acres. The production of Iowa was the largest ever produced by that State or by any State. The average acre-yield ranged from 13 bushels in Florida to 50 in Connecticut. Among the leading States Iowa stood first, with an average yield of 43 bushels per acre, and Ohio second, with 42.8 bushels.

While the United States produces about three-fourths of the world's crop, it furnishes only about one-third of the quantity entering into international trade. The exports for the year ending June 30, 1912, amounted to 40,038,795 bushels, and for the preceding year to 63,761,458 bushels. On March 1, 1912, about 884,069,000 bushels, or 39.4 per cent. of the previous year's crop, remained in farmers' hands, as compared with 1,165,378,000 bushels, or 40.4 per cent. of the crop of 1910, held on farms March 1, 1911. The supply of old corn on the farms at the time the 1912 crop was harvested was estimated at about 70,000,000 bushels, a smaller quantity than is usually carried over. The surplus for distribution from the supply of 1912 was estimated at 240,000,000 bushels.

CORNELL UNIVERSITY. The total registration in all departments of the university in 1912 was 4468, divided as follows: College of Arts and Sciences, 1032; New York State Veterinary College, 118; New York State Agricultural College, 1181; College of Law, 295; College of Mechanical Engineering, 917; College of Civil Engineering, 513; College of Architecture, 133; Department of the Graduate School, 279. The faculty numbers 696, which includes emeritus professors, professors, associate professors, lecturers, instructors, and assistant instructors. President Schurman was given leave of absence on his appointment as minister to Greece (see UNITED STATES, *Diplomatic Service*). The following professors died during the year: George William Jones, William Albert Finch, John Craig, and Ralph Stockman Tarr. Prof. H. S. Williams retired as emeritus professor. The following professors resigned: J. W. Jenks, to accept the position of financial adviser to China; Prof. E. W. Kemmerer, and Prof. B. M. Duggar. Prof. A. S. Johnson was called to the head of the department of economics from Stanford University; Prof. W. E. Lunt was appointed to the new professorship of modern European history; Prof. E. G. Montgomery was called to the chair of farm crops, and E. N. Spring to the second chair in for-

estry. Among the donations received during the year 1911-12 was an endowment fund for the promotion of studies in German culture made by Mr. Jacob H. Schiff. Out of this fund was established the Jacob H. Schiff Fellowship in German and the Jacob H. Schiff Lectureship (non-resident) for the promotion of studies in German culture. Mrs. Florence Rand Lang during the year completed her gift of \$60,000 to the university. Col. Oliver H. Payne gave \$180,000 for the Medical College in New York City. The Fraser scholarships in law were made possible by a gift of \$3000 by Mr. William Metcalf, Jr. The number of volumes in the library was 409,700, with 62,000 additional pamphlets. The productive funds of the university amounted to \$9,525,000 and the income to about \$1,385,000. Acting-president in 1912-13, Prof. Thomas Frederick Crane.

COSTA RICA. A Central American republic between Nicaragua and Panama. Capital, San José.

AREA, POPULATION, ETC. Estimated area, 18,691 square miles (48,410 square kms.). The population December 31, 1911, is reported at 388,266; by provinces: San José, 121,162; Alajuela, 91,707; Cartago, 59,968; Heredia, 42,659; Guanacaste, 33,810; Puntarenas, 20,040; Limón, 18,920. The enumeration, however, is incomplete, as it does not include the districts of Pacuarito, Río Hondo, Cimarrones, Madre de Dios Florida, La Germania, Pocora Este, El Cario, and El Peje, or the towns of Florencia, Aguas Zarzas, Tres Amigos, and Kopper de San Carlos. The city of San José has 31,668 inhabitants. In 1910 immigrants numbered 11,233; emigrants, 7236; births, 15,847; deaths, 9723. In 1911, births and deaths, 16,839 and 9483. Pupils in primary and secondary schools, about 32,000; teachers, over 1000.

PRODUCTION AND COMMERCE. The people are engaged chiefly in agriculture, which is carried on successfully. Besides the principal crops, bananas and coffee, the products include corn, sugar, beans, rice, and cacao.

Imports and exports in 1910: 16,984,378 and 18,009,385 colones respectively; in 1911, 19,079,917 and 19,191,808. The leading imports are cotton fabrics, rice, flour, and iron and steel goods. Chief exports in 1910 and 1911: Bananas, 9,097,285 and 9,309,586; coffee, 5,916,181 and 6,109,542; gold and silver in bars, 1,744,487 and 2,517,372; woods, 169,079 and 193,732; hides and skins, 269,719 and 188,542; rubber, 219,957 and 180,784; cacao, 88,556 and 185,806. By far the greater part of both imports and exports passes through the port of Limón. The United States supplies nearly one-half of the imports and receives over one-half of the exports, Great Britain and Germany ranking second and third.

COMMUNICATIONS. The Atlantic port Limón is connected by rail with the Pacific port Puntarenas, by way of San José. Length of railways, 694 kms. (431 miles). Telegraphs: 128 offices, 2437 kms. of wire. Post offices, 199.

FINANCE. The standard of value is gold; the monetary unit, the colon, par value 46.536 cents. Revenue and expenditure for fiscal years, in colones:

	1909-10	1910-11	1911-12
Revenue	9,280,584	11,471,967	9,707,269
Expenditure	9,280,584	8,858,572	9,801,956

Of the 1911-12 revenue, 5,829,653 colones were derived from customs and 2,322,446 from liquors. The larger departmental expenditures: Finance, 3,800,644 colones; public works, 1,705,816; war, 1,240,542; public instruction, 1,081,331; government, 754,542. Debt, December 31, 1910: Foreign, £1,617,200; internal, 27,974,408 colones. A new foreign loan (French) of 35,000,000 francs, announced in October, 1911, was issued in 1912, proceeds to apply on internal debt.

GOVERNMENT. The president, elected for four years, is assisted by a cabinet of five members. The congress consists of a single chamber of 43 representatives. Both president and representatives are elected by indirect vote. The president in 1912 was Ricardo Jiménez, who was inaugurated May 8, 1910, succeeding Cleto González Víquez.

COST OF FOOD. See **FOOD AND NUTRITION.**

COST OF LIVING. See **PRICES.**

COTTON. The Bureau of Statistics of the United States Department of Agriculture on December 17, 1912, estimated the cotton crop of the United States for 1912 at 13,820,000 bales of 500 pounds each. The crop, together with the seed, it is believed, will be worth \$860,000,000. The International Institute of Agriculture about the same date estimated the cotton production of the United States, India, Egypt, and Japan at over 15,000,000 bales, an amount about 4 per cent. less than last year's crop. According to the United States Bureau of the Census, on December 13, 1912, there had been ginned of the American crop 12,424,853 running bales, excluding linters. On the same date in 1911, 88.5 per cent. of the total crop had been ginned. These statistics include Sea Island cotton as follows: Florida, 19,505 bales; Georgia, 34,537 bales, and South Carolina, 4702 bales.

The estimated crop and the amount ginned on December 13, 1912, by States, were as follows:

State	Est'd crop (500-lb bales)	Reported ginned (running bales)
United States.....	13,820,000	12,424,853
Alabama	1,330,000	1,223,336
Arkansas	854,000	700,874
Florida	68,000	52,882
Georgia	1,701,000	1,666,899
Louisiana	435,000	364,113
Mississippi	1,109,000	884,992
North Carolina	878,000	820,249
Oklahoma	1,039,000	904,347
South Carolina.....	1,184,000	1,127,480
Tennessee	280,000	231,341
Texas	4,850,000	4,370,640
All other States.....	92,000	77,800

Of the States listed as "all others," Virginia is estimated to have produced 24,000 bales, Missouri 59,000, and California 9000 bales. Cotton is grown in other States, but in such small quantities as not to be included in the estimates.

The final report of the Bureau of the Census

on the crop of 1911 showed there were produced 16,205,097 bales of 500 pounds each. This total included 546,769 bales of linters and 119,252 bales of Sea Island cotton. The production by States was:

States	500-lb bales	States	500-lb bales
Unit'd States.....	16,205,097	North Carolina	1,101,104
Alabama	1,753,484	Oklahoma	1,080,138
Arkansas	971,311	South Carolina	1,677,204
Florida	84,977	Tennessee	478,249
Georgia	2,838,571	Texas	4,437,876
Louisiana	399,525	All others.....	154,137
Mississippi	1,248,521		

The world's production of cotton for mill consumption for 1911 showed a decided increase over that of 1910, a gain of about 3,500,000 bales being recorded. The contributions of the different countries to the supply of 1911 and 1910, according to the United States Census, were as follows:

	1911	1910
Country	500-lb bales	500-lb bales
Total	22,297,000	18,711,000
United States	15,546,000	11,483,000
British India	2,514,000	3,082,000
Egypt	1,450,000	1,506,000
Russia	1,200,000	900,000
China	625,000	775,000
Brazil	320,000	310,000
Peru	128,000	128,000
Mexico	124,000	105,000
Turkey	100,000	135,000
Persia	80,000	90,000
Other countries.....	210,000	195,000

The world's consumption for the year ended August 31, 1912, was 20,402,000 bales of 500 pounds net weight. The number of active consuming spindles is estimated at 140,996,000. The United States contributed 69.7 per cent. of the world's cotton supply in its crop of 1911. The exports of cotton for the year ended June 30, 1912, were 10,675,445 bales, valued at \$565,849,271, and the imports for the same period were 109,780,071 pounds (equal to 219,560 bales of 500 pounds each), valued at \$20,217,581. As usual, a large proportion of the imported cotton came from Egypt and was purchased for special purposes.

Data regarding the 1912 crop in other lands are very meager and conflicting, most of the available estimates having been made before the crop was ginned. Aside from the estimate of the Institute of Agriculture at Rome of a crop of 18,000,000 bales for the United States, India, Egypt, and Japan, reports from Egypt indicate a crop of 1,550,000 bales and India 2,113,600 bales of 500 pounds each. From German East Africa 5000 bales are expected to be marketed, and from Togoland 2500 bales. In the province of Adana, Asiatic Turkey, a crop of 100,000 bales is estimated. In the Italian province of Eritrea 3500 bales were produced. A recent review of the cotton industry of Lancashire showed that while the demand for raw cotton increased 70 per cent. on the continent of Europe from 1892 to 1910, and there was an increased consumption of 90 per cent. in the United States, the demand in Great Britain fell off more than 4 per cent. To meet this situation the British Cotton-Growing Association, with a capital of \$2,000,000, is attempting to foster cotton culture in Africa, the West Indies, and other British dependencies. In 1908 the association marketed 16,713 bales, and in 1911

27,873 bales, indicating a gradual increase. In September, 1912, Lagos and Northern Nigeria had marketed 8853 and 2301 bales, respectively, as compared with 5274 and 500 in 1911. In Uganda the production has increased from about 200 bales in 1907 to over 2000 bales in 1911. The situation in Nyasaland and Southern Nigeria is not promising, transportation problems being very perplexing. From the British West Indies in 1911 there were exported 6197 bales of cotton, valued at \$989,375. In the French colonies the production has shown a slight increase, the crop of 1910 being reported as 1566 bales and that of 1911 as 2048 bales. An attempt of the French Cotton Association to grow cotton in Madagascar during the past year failed by reason of drought and insect depredations. The Russian government is attempting to become independent for her cotton supplies, and an appropriation of \$100,000 was made in 1912 for the development and improvement of cotton cultivation in Transcaucasia and Central Asia. The government has also undertaken the extension of irrigation projects and is arranging special credit organizations for the benefit of cotton growers. In the consular district of Batum over 75,000 acres were planted to cotton in 1911. Under the auspices of the Portuguese government the first cotton in Portuguese East Africa was grown in 1911; 200 bales of American long staple upland cotton, valued at from 11 to 16 cents a pound, were produced from 120 acres. Japan is trying to develop cotton culture in Korea, but the crop of 1911 was reported as only 900 tons, as compared with 2200 tons in 1910. An attempt to grow Egyptian cotton in Siam was a failure. Statistics regarding the production of cotton in China are difficult to obtain, but it is believed that China produces four-fifths of the cotton required by its people. An attempt has been begun to grow cotton in Argentina, but the scarcity of labor will prove a serious obstacle to its extension. The Egyptian government has established markets for the purchase of cotton throughout the country, where the producer can be assured correct grading and weighing. Cotton-testing laboratories were established at Havre, France, and Shanghai, China, to determine the moisture in cotton offered for sale. Similar laboratories have been in operation in other localities of Europe and America for some time. An experimental cotton warehouse built of reinforced concrete was erected in Manchester, England, during 1912. It is believed this type of warehouse will greatly reduce storage charges.

WORK OF THE U. S. DEPARTMENT OF AGRICULTURE. The preparation and distribution of the official cotton grades has been continued and these types are now distributed in twenty-five States and also in England, Germany, France, Italy, India, Brazil, and Mexico, 131 sets being sold during the past year. Improved facilities have made it possible to reduce the price of these sets to \$25. Investigations are in progress on improved methods of ginning and handling cotton, the moisture in baled cotton, and the effect of diseases, especially the root rot, on the quality of fibre. The farmers' coöperative demonstration work in the boll-weevil infested region has been continued, 13,641 demonstrators reporting upon 109,999 acres of cotton. On these farms the yield of

cotton was more than 75 per cent. greater than for the entire States. Nearly 5000 boys were enrolled in cotton clubs organized during the year, each boy being expected to grow at least two acres. The experiments in acclimatizing and breeding Egyptian cotton at Yuma, Ariz., have proved so successful that coöperative plantings in other similar regions were begun, and about 800 acres were planted to this crop in Arizona and California. The department has verified in California the discovery of the Hawaii Experiment Station in 1909, that cotton can be readily grown from cuttings, thus making it possible to perpetuate desirable strains without the possibility of deterioration through planting of seed. Considerable assistance was rendered by the department in arranging uniform regulations for the various State quarantines against the spread of the Mexican cotton boll-weevil and in testing cultural and other means for its control. This serious pest occupied about 1400 square miles in the United States in 1892 and 271,000 square miles in 1912, its average annual advance for the last six years having been over about 27,000 square miles. During 1912 the bollworm continued its eastward advance in Alabama and Florida, and 5 counties in western Florida and 25 in Alabama, or about one-third of the latter State, are now infested. The U. S. Bureau of Entomology reports 49 species of insect enemies of the boll-weevil, and it is claimed that 40 per cent. of the natural means of control is due to other insects. A weevil enemy of Caravonica cotton is reported in German East Africa, the habits and injury caused being very similar to those of the Mexican boll-weevil.

COULLIÉ, PETER HECTOR. A Roman Catholic cardinal, archbishop of Lyons, died September 11, 1912. He was born in Paris in 1839 and served as archbishop of Lyons for several years previous to his elevation to the cardinalate by Pope Leo XIII. in 1897.

COUNTERMINE, JOHN DONNAN. An American clergyman and writer, died December, 1912. He was born in Schenectady, N. Y., in 1850, and graduated from Union College in 1873. He studied at the Princeton Theological Seminary, graduating in 1876, and took a special course in philosophy, science, and literature at Omaha University. He was ordained to the Presbyterian ministry in 1876, and held several pastorates in New York City and Albany and in Kansas. He was pastor of the First Church of Topeka, Kansas, from 1897 to 1904. In the latter year he resigned to enter evangelistic work and continued this until 1910, when he was appointed professor of Old Testament History and Criticism and New Testament Exegesis and Comparative Religions in the Philadelphia training school for Christian workers. He was at the same time pastor of the Fourth Reformed Protestant Church in Philadelphia. He was the author of *The Religious Belief of Shakespeare* (1906); and *Day-break Everywhere* (1907). He also contributed to the religious and secular press.

COX, CHARLES FINNEY. An American scientist and railway official, died January, 1912. He was born in Richmond county, N. Y., in 1846 and graduated from Oberlin College in 1869. He engaged in railroad work and became treasurer of several important railroads. He was a Fellow of the New York Academy of Sciences, and acted as its president in 1908-9. He was also president of the New York Microscopical Society in 1888, and was one of the founders and chief promoters of the New York Botanical Gardens. As a result of his important contributions to microscopical botany and zoölogy he was elected a Fellow of the Royal Microscopical Society of London. His most important published work is *Protoplasm and Life*.

CRAIG, JOHN. An American horticulturist, died August 11, 1912. He was born in Lakeville, Quebec, Canada, in 1864. In 1885 he was horticulturist at the Iowa State College and in 1888 was appointed assistant horticulturist at the Iowa Experiment Station. From 1890 to 1897 he was horticulturist of the Dominion Experiment Station at Ottawa, Canada. He returned to the Iowa State College in 1898 and in the following year was appointed professor of horticulture and forestry in that institution. In 1893 he was appointed professor of horticulture at Cornell University. From 1904 to the time of his death he was editor of *The National Nurseryman*. He was the author of *Practical Agriculture* (1901), and contributed to the *Cyclopædia of American Horticulture*.

CRANE, RICHARD TELLER. An American manufacturer, died January 8, 1912. He was born in 1832 and spent his early life chiefly in manual labor. He learned and worked at the machinist's trade in Paterson, Brooklyn, and New York until 1855, when he removed to Chicago, where he soon started in business in a brass foundry. He was later joined by his brother, Charles S. Crane, in the firm of R. T. Crane and Brother. This developed into one of the largest manufacturing industries in its line in the United States. Crane attracted wide attention by his writings in opposition to college education for men.

CREDIT BANKS. See AGRICULTURAL CREDIT.

CRÉDIT FONCIER. See AGRICULTURAL CREDIT.

CRETE. An island in the Mediterranean Sea; an autonomous state under the suzerainty of Turkey. Area, 3327 square miles; population (census of April 17, 1911): 307,812 Christians, 27,852 Mohammedans, 487 Jews, 7850 Europeans—total, 344,001. Canea, the capital, has 24,399 inhabitants; Candia, 25,185; Retymno, 9086. Greek is the language of the people. The chief products for export are wheat and fruit, wool, soap, olive oil, carobs, val-lonea, and cheese. The trade (mostly with Greece and Turkey) amounted in 1910 to 19,650,000 drachmas imports and 17,477,000 exports. Tonnage entered, 1,811,865. Revenue (1909-10), 6,024,729; expenditure, 8,567,251. Debt, 5,317,226 drachmas. No successor was appointed to the retiring high-commissioner, M. Zaimis, in 1911, and the ultimate disposition of the island was indefinitely postponed; but in October, 1912, following upon her declaration of war with Turkey, Greece sent a representative to govern the island in the name of the king of Greece. See below.

HISTORY. Disturbed conditions in Crete continued during the early part of 1912. In

February riots occurred leading to the murder of a number of Moslems. The consuls of the protecting powers protested in a note to the Cretan government against the attitude of the insurgent parties and declared that if certain measures that were apparently contemplated were taken, for example, the sending of deputies to Athens or the dismissal of Mohammedan employees, and if the persecution of the Mohammedans continued, the powers would take the necessary steps to prevent such acts. The powers insisted on the maintenance of the *status quo*, but would certainly take measures unfavorable to Cretan aspirations if the Cretes were unable to govern themselves peacefully. Additional warships were sent into Cretan waters. The extremists gained the upper hand in the Cretan Assembly, which voted to send the deputies to Athens. The Assembly then voted to abolish the present government. A "constituent" Assembly was formed to carry on the administration. This amounted to the replacing of the executive government by a revolutionary authority. The president of the Assembly was vested with the entire civil and military power. The government offices were seized by the military. The crisis came to an end on March 15 with the election of a permanent commission by the Assembly. The commission was to comprise eighty-one members, of whom five selected from the different parties were to form an executive body.

Nineteen of the deputies elected to represent Crete in the Greek Chamber were intercepted by a British cruiser on April 28 and detained at Suda Bay till the beginning of June when the Greek Chamber was prorogued. But about forty other deputies succeeded in reaching Athens with the avowed intention of taking seats at the new session of the Chamber. M. Venezelos, the Greek premier, refused to admit them, saying that he had promised the powers to exclude the deputies, and thereby had averted the reoccupation of the island on which the powers had determined if the deputies were admitted. The approaches to the Chamber were guarded and the Cretan deputies were detained till after the session had closed. A filibustering expedition of the Cretans against Samos was disapproved of by the Greek government and came to nothing. On the approach of the war with Turkey, however, Greece changed her attitude and in her ultimatum to the Ottoman government included a demand for the admission of the delegates. One of her first acts after the outbreak of the war was to admit the Cretan delegates to the Assembly (October 14). M. Stephen Dragoumis, premier of Greece in 1910, was appointed governor-general of Crete. See TURKEY AND THE BALKAN PEOPLES. For archaeological discoveries in Crete in 1912, see ARCHAEOLOGY.

CRICKET. The Philadelphia Cricket Club visited England in August and made an excellent showing, winning five matches, losing three, and drawing one. The Philadelphians scored victories over Reigate Priory, Royal Artillery, Stoke Poges, The Mote, and Blackheath. They lost to Mr. J. R. Tilden's XI., Folkestone, and Satton. Another tour which attracted considerable interest in cricket circles was that taken by the Australians in the United States, Canada, and Bermuda. Seven matches were played, of which the Australians won five, drew one, and lost one. The only team to defeat the in-

vaders was the Gentlemen of Philadelphia. The Australians won victories over New York XV., Gentlemen of Philadelphia (second match), All-Bermuda, Winnipeg XV., and British Columbia XV. The Rosedale Club of Toronto, in a trip to Philadelphia, lost to Germantown, Morristown-Frankford, and Gentlemen of Philadelphia, but defeated the Philadelphia Club and drew with Merion. The Germantown Club visited Canada, where it scored victories over Toronto, Ottawa, and Rosedale, and was defeated by Montreal. In the forty-second annual match between the United States and Canada the United States won. England was the victor in the triangular contest with Australia and South Africa. Cambridge turned the tables on Oxford in their annual match, while Eton again defeated Harrow.

The Richmond County Club won the championship of the New York and New Jersey Cricket Association with seven victories, three draws, and no defeats. The Metropolitan District League laurels went to the Brooklyn Club in Class A and to Bensonhurst in Class B. A new record for the United States and Canada was established in 1912 by F. J. Higgins of Los Angeles, who scored seven centuries.

CROSS-COUNTRY RUNNING AND MARATHONS. The Senior Metropolitan Cross-Country Championship run, the principal event of the kind in the United States, was held at New York City. William J. Kramer of the Long Island A. C. for the fourth successive year was the individual winner, his time for the six miles being 34 minutes 37½ seconds. T. Johansson of the Irish-American A. C. finished second and F. Bellars of the New York A. C. third. The team scores were: Irish-American A. C., 42; New York A. C., 64; Long Island A. C., 73. T. F. Barden, unattached, won the National A. A. U. cross-country championship, his time being 35 minutes 27 seconds. M. D. Huysman of the Irish-American A. C. finished second and M. Hughes of the New York A. C. third. The winning club was the Morningside A. C.

Harvard broke Cornell's long string of victories by winning the intercollegiate cross-country run held at Ithaca, N. Y., November 23. John Paul Jones of Cornell, however, captured the individual honors for the third successive year. His time was 32 minutes 29½ seconds. Taber of Brown finished second, and Copeland of Harvard third. The score and order at the finish of the colleges entered were: Harvard, 32; Cornell, 48; Dartmouth, 87; Brown, 117; Pennsylvania, 154; Massachusetts Institute of Technology, 156; Syracuse, 174; Princeton, 199; Yale, 209; College of the City of New York, 312. In dual cross-country runs Harvard defeated Yale and Cornell, Princeton defeated Columbia, Cornell defeated Pennsylvania, Yale defeated Princeton, and Pennsylvania defeated Carlisle.

The results of the principal amateur Marathons held in 1912 follow: Boston A. A., 25 miles, won by M. Ryan of the Irish-American

A. C. of New York, in 2 hours 21 minutes 18½ seconds, a new record for the course; Missouri A. C., 25 miles, won by Joseph Erxleben of the Missouri A. C., in 2 hours 36 minutes 30 seconds; modified Marathon, New York, 12½ miles, won by Louis Scott of the South Pater-son A. C., in 1 hour 8 minutes 28½ seconds; London Marathon, 26 miles, won by J. Corkery of the Irish-Canadian A. C., in 2 hours 26 minutes 55½ seconds. The National A. A. U. 10-mile championship was won by Harry Smith, unattached, his time being 53 minutes 51½ seconds.

The American Professional Championship Marathon, held at Newark, N. J., was won by W. Kolehmainen, whose time, 2 hours 29 minutes 35½ seconds, established a new world's record. Kolehmainen also won the Powderhall Marathon at Edinburgh and the 12-mile indoor race at New York City. The Paris Marathon was won by Hans Holmer, who finished second to Kolehmainen in the American professional event. See **ATHLETICS, TRACK AND FIELD, and OLYMPIC GAMES.**

CROTHERS, AUSTIN LANE. An American public official, former governor of Maryland, died May 25, 1912. He was born in Cecil county, Md., in 1860, and was educated at the University of Maryland and after studying law was admitted to the bar. From 1891 to 1895 he was State's attorney for Cecil county and from 1897 to 1901 was a member of the State Senate. He was defeated for reelection to the Senate in 1902 and 1906. In 1908 he was appointed judge of the circuit court, but being elected governor of the State in that same year, he resigned the former office. He served from 1908 to 1912.

CUBA. A West Indian island republic. The capital is Havana.

AREA, POPULATION, ETC. The area is 44,164 square miles comprised in six provinces—Havana, Pinar del Río, Matanzas, Santa Clara, Camagüey, and Oriente. Estimated population June 30, 1911, 2,223,284, of whom 1,961,896 natives and 261,388 foreigners; 1912, 2,271,762. The census of September 30, 1907, disclosed a population of 2,048,980, as compared with 1,572,797 in 1899. Of the total inhabitants in 1907, 69.75 per cent. were white, 16.40 mulatto, 13.28 black, and 0.57 yellow. Immigration in 1910, 32,606, of whom 28,380 Spanish; in 1911, 38,053, of whom 32,104 Spanish, 1369 North American, and 932 British. The larger cities are Havana (estimated population, 320,000), Santiago de Cuba, Cienfuegos, Matanzas, Puerto Principe, and Cárdenas. Enrollment in the public schools in February, 1911, 152,658 (attendance, 105,774); in private schools, 24,434.

PRODUCTION. Sugar-cane and tobacco are the staple crops. Large quantities of fruits and vegetables are raised. The output of raw sugar for the year 1911-12 was estimated at over 1,850,000 tons; the output in 1910-11 was 1,460,391 tons, in 1909-10 1,804,349, in 1899-1900 283,051. From sugar-cane are also pro-

duced large quantities of molasses and spirits. The cultivation of tobacco is most important in Pinar del Río and makes possible the important industry of cigar and cigarette manufacture. Reported tobacco yield in 1909, 494,358 bales (of about 120 pounds); in 1910, 639,598. Cattle-raising is carried on extensively in some parts of the country, especially in Camagüey. Livestock June 30, 1910: Cattle, 3,098,179; horses, 572,901; mules, 59,994; asses, 2414. There are large mineral resources, especially in Oriente, including iron, copper, manganese, lead, zinc, gold, and salt. The mineral output in 1910 was valued at \$4,374,719.

COMMERCE. The values of the imports and exports of merchandise are reported as follows: 1908, 86,368,767 and 98,840,091; 1909, 83,856,835 and 115,637,321; 1910, 98,239,539 and 144,036,697. Imports and exports of precious metals: 1908, 1,150,376 and 4,245,769; 1909, 2,934,536 and 1,926,546; 1910, 5,206,588 and 2786. The leading imports are breadstuffs, meats, cotton goods, machinery, iron and steel, and vegetables. Principal exports in 1910: Sugar, \$108,782,000; tobacco, \$27,874,000; iron ore, \$3,925,000; fruits, \$2,098,000. Reported trade by countries in 1911: United States imports \$60,015,000, exports \$106,853; other America, \$9,159,000 and \$3,642,000; United Kingdom, \$13,399,000 and \$5,697,000; Spain, \$9,205,000 and \$460,000; France, \$6,203,000 and \$1,307,000; Germany, \$7,235,000 and \$3,642,000; other Europe, \$5,352,000 and \$809,000; other, \$2,399,000 and \$726,000; total, \$113,267,000 and \$123,136,000.

Entered at the ports in the foreign trade, 1911: 1573 vessels, of which 1462 steam; coastwise, 1623 vessels, 1448 steam. Merchant marine, 1911: 41 steamers, of 32,315 tons, and 121 sail, of 11,964 tons.

COMMUNICATIONS. Railways in operation at the beginning of 1911 aggregated 3433 kilometers (2133 miles); telegraphs, 8151 kms. (5848 miles) of line, with 9952 rms. (6184 miles) of wire and 171 offices; wireless telegraph stations, 10; post offices, 487.

FINANCE. In 1910, revenue and expenditure amounted to \$41,614,694 and \$40,593,392. The balance in the treasury was \$1,960,331. Customs in 1910 yielded \$24,838,030. For the fiscal year 1912-13, the revenue was estimated at \$37,940,000 and the expenditure \$33,074,147. Branches of estimated revenue: Customs, \$26,434,000; excise, \$3,900,000; lottery, \$3,700,000; direct taxes, \$1,113,000; posts and telegraphs, \$1,076,000; consular dues, \$500,000; other, \$1,217,000; total, \$37,940,000. Estimated expenditures: Administration, \$10,117,394; public instruction, \$4,782,653; sanitary service, \$3,784,987; public debt, \$3,710,500; public works, \$3,704,625; finance, \$3,329,504; justice, \$2,038,220; executive, \$1,000,540; foreign affairs, \$717,224; agriculture, industry, and commerce, \$488,400; total, \$33,974,147.

GOVERNMENT. The president is elected by indirect vote for four years and is assisted by a cabinet of eight members. The legislature is bicameral, consisting of the Senate (twenty-four members, four for each province) and the House of Representatives (eighty-three). The president in 1912 was Gen. José Miguel Gómez, inaugurated January 28, 1909; vice-president, Alfredo Zayas. On November 1, 1912, Gen. Mario G. Menocal and Enrique José Varona, the Conservative candidates, were

elected president and vice-president respectively. Each of the provinces is administered by an elective governor.

HISTORY. Internal troubles became manifest in Cuba early in the year, and led to warnings by the United States that intervention might follow if the disorders assumed a revolutionary character. On May 22 a serious revolt of the negroes was reported, and on May 25 the United States Senate authorized the government to intervene in certain contingencies. Meanwhile the government was making naval preparations on an extensive scale. By the latter part of May a fleet of eight battleships, with a hospital ship and several tugs, was concentrated at Key West. President Taft assured the president of Cuba that this was due merely to the desire to act promptly if it should be necessary to protect American life and property, and that these precautions had nothing to do with any purpose of intervention. It was announced on June 14 that the government forces had attacked and routed the chief body of rebels under the command of their generals, Estenoz and Ivonet, near Jara Huerca. The rebels were completely routed and suffered heavy loss. They left all their ammunition and provisions in the hands of the government troops. The American marines were ordered home on July 25. In connection with a demand for immediate settlement of American claims, an assault was made by a reporter on the American chargé d'affaires, but upon the protest of the United States an apology was tendered. (See UNITED STATES, *Foreign Affairs*.) The campaign for the first presidential election since the withdrawal of the United States troops began in April. The Conservative candidate was General Juan Mario Menocal, and the Liberal, Vice-President Alfredo Zayas. The election was held at the beginning of November and passed off without disturbance.

It was given out in 1912 that the questions at issue between Cuba and the governments of England, France, and Germany would be settled by friendly negotiations. Claims dating from the Spanish régime had in the past caused strained relations with those governments, especially with that of France.

CUMBERLAND PRESBYTERIAN CHURCH. The denominational body now known under this title is that portion of the larger denomination of the same name whose General Assembly in 1906 voted to combine with the Presbyterian Church in the United States. The present members of the Cumberland Presbyterian Church refused to abide by this decision and organized into a separate body. During the years from 1906 to the present time litigation has been carried on between representatives of this body and the Presbyterian Church in the United States in regard to the possession of the properties of the former Cumberland Presbyterian Church. This litigation is being conducted in a number of States. During 1912 the Cumberlands lost in the Supreme Court of Oklahoma. The report to the effect that the Cumberlands had lost in the United States Supreme Court in 1911 was erroneous. To the close of 1912 no case had yet reached the United States Supreme Court except on the question of jurisdiction, on which question the decision was in favor of the Unionists. From the best statistics available the total number of churches is 1457, and the total membership, estimated, 110,000.

CUMMINS, SENATOR. See **PRESIDENTIAL CAMPAIGN.**

CUNNINGHAM COAL CLAIMS. See **ALASKA.**

CUPPLES, SAMUEL. An American manufacturer and philanthropist, died January 7, 1912. He was born in Harrisburg, Pa., in 1831 and was educated in the public schools. He began his business career as a boy in a grocery store in Pittsburgh in 1843 and in 1846 he removed to Cincinnati. In 1851 he engaged in the manufacture of wooden ware in St. Louis. This grew to be one of the largest enterprises in the country. He took an active interest in educational matters and is said to have done more than any other man to build up the public schools of Missouri. He promoted the St. Louis Manual Training School, on which most of the manual training schools of the country are modeled. His gifts to educational institutions amounted to millions of dollars. One of his largest gifts was that of property valued at \$3,500,000 to Washington University, St. Louis.

CURAÇAO. A Netherlands West Indian colony, 436 sq. miles, composed of the islands of Curaçao (212 sq. m.), Bonaire (Buen Ayre), Aruba, St. Martin, St. Eustations, and Saba. Total population December 31, 1910, 54,469 (24,297 males, 30,172 females). Export of phosphate: Curaçao, 3571 cubic meters; Aruba, 33,542. Raw gold export (Aruba), 59,421 kilos. Total imports (1910), 3,162,310 guilders; exports, 1,716,886; tonnage entered, 2578; revenue (estimate 1912), 690,000 guilders; expenditure, \$1,107,000; subvention, 417,000. Dr. Th. I. A. Nugens, governor in 1912.

CURRENCY REFORM. The agitation for a revision of banking and currency laws, which had been a conspicuous feature of public discussion during all the years following the 1907 panic, continued in scientific and financial circles during 1912, but was pushed into the background so far as the general public was concerned by the excitement of the political campaign. Even the American Bankers' Association, which had unqualifiedly and by unanimous vote approved the Aldrich plan at the New Orleans meeting in 1911, did not reindorse it nor appoint a committee to further it or any other plan of currency revision at the Detroit convention in September, 1912. The principal reason for this was the desire of the bankers to avoid making any proposals for banking and currency reform issues of the political campaign which at that time was at its height. It was argued that wise legislation would be more probable if the subject did not become a matter of partisan politics. The bankers' association therefore contented itself with merely declaring its willingness to cooperate in devising a satisfactory financial system.

Though banking reform did not figure as an issue in the campaign, the various party platforms contained planks with reference to it. The Republican platform did not mention the Aldrich plan, but declared revision to be necessary in order to prevent money panics, to "promote the prosperity of the country by producing constant employment," and to aid in crop movements; it held that reform should safeguard the individual banks against domination by sectional, financial, or political interests. The Democratic platform was of much

the same tenor, with the addition of open "opposition to the Aldrich plan or the establishment of a central bank." The Progressive party also disapproved the Aldrich plan, but demanded currency reform and protection from Wall Street control. It also stated, "We believe the present method of issuing notes through private agencies is harmful and unscientific. The issue of currency is financially a governmental function." This last proposal was condemned by some as a reversion to the doctrines of the Greenback party. It did not figure, however, as an actual political issue of importance in the presidential campaign. For full discussion see **BANKS AND BANKING.**

CURTISS. See **NAVAL PROGRESS, Aviation.**
CURTISS TURBINE. See **STEAM TURBINE.**

CUTTING, WILLIAM BAYARD. An American lawyer and philanthropist, died March 1, 1912. He was born in New York in 1850 and graduated from Columbia University in 1869. He studied law and was admitted to the bar in 1871. From that time until his death he practiced law in New York City. He took an active interest in social questions and was prominent in reform politics. He was civil service commissioner in New York City under Mayor Low and was also president of the tenement house commission. He was a director in many financial institutions. He was also a trustee or director of Columbia University, New York Botanical Gardens, and the Museum of Natural History.

CYCLING. Frank J. Kramer of East Orange retained his title as professional sprint champion, although Alfred Gouillet, the winner of the Western series of races, tied the champion in total number of points. Gouillet, however, refused to meet Kramer in a deciding race. Kramer, in the Eastern series, scored five firsts, one second, and one third. Alfred Grenda took second place in the East with one first, three seconds, and one fourth. Gouillet scored five firsts and two seconds. Fogler made the next best showing, with two seconds, three thirds, and one fourth. George Wiley captured the professional paced championship, scoring twenty firsts, 10½ seconds, and 2½ thirds. The amateur championship was won by Donald McDougall, who captured five firsts and one fourth. McDougall also won the 1-mile amateur sprint at the World's Championship meet held at Newark. Other winners at this meet were: 100 kilometers, motor-paced professional race, George Wiley; 1-mile professional sprint, Frank J. Kramer.

Among the new records established in 1912 were: ¼ mile, against time, unpaced, 33 seconds, by A. J. Clarke; ¾ mile, 1 minute 11½ seconds, by Alfred Gouillet; ¾ mile, 1 minute 24¾ seconds, by A. Gouillet; 1 mile, 1 minute 5 seconds, by A. Gouillet; ½ mile, amateur, unpaced, 38 seconds, by E. L. Young; ½ mile, 56¾ seconds, by E. L. Young; 150 miles, amateur competition, 8 hours 26 minutes 27 seconds, by Joseph G. Kopsky.

The annual six-day race was held in Madison Square Garden December 9 to 14. The winning team was Rutt and Fogler. Moran and Fogler won the Boston six-day race.

CYPRUS. An island in the easternmost basin of the Mediterranean, nominally a part of the Ottoman Empire, but ceded for administrative purposes to Great Britain in 1878. It

covers 3584 square miles and its population by districts (1911) is as follows: Nicosia, 81,497; Famagusta, 58,530; Larnaca, 29,737; Limassol, 46,084; Papho, 38,508; Kyrenia, 19,752—total, 274,108. The Mohammedans form about 25.9 per cent. of the population, the remainder being nearly all Christians of the native Cypriote Church. Nicosia, the capital, had, in 1911, 16,052 inhabitants. Elementary schools of all classes, 583 (187 Mohammedan, 396 Christian); with a total enrollment of about 30,779 (5675 Mohammedans).

Agriculture, the chief industry, has been greatly retarded by reason of the lack of water; the rivers, nearly all mountain torrents, dry up in summer, and the rainfall is deficient. A plan for storing water for irrigation is in process of realization. The large numbers of goats, together with frequent forest fires, are a hindrance to the development of otherwise valuable forests. Cereal, carobs, the famous Cyprus wine, cheese, fruit, vegetables, and livestock are exported. The imports in 1910 were valued, exclusive of specie, at £588,480 (from Great Britain, £118,203; from British colonies, £2116; from other countries, £468,161; the exports at £651,068 (to Great Britain, £138,839; to British colonies, £994; to other countries, £511,235). Shipping entered and cleared (1910), 742,485 (British, 105,451). Revenue (1910-11), £286,848; expenditure, £251,520. Government grant (1911-12), £50,000 (1910-11, £40,000). A sum of £92,800 is payable annually to Turkey, but this is appropriated to the interest on the guaranteed loan of 1855. British high-commissioner in 1912, Major Sir H. J. Goold-Adams.

On account of riotous movements in the town of Limasol during May the high-commissioner announced at the beginning of June that an armed force of British troops would occupy it until further notice and would disperse any gathering held for the purpose of breaking peace. A number of rioters were arrested and the police force was strengthened for fear of attempts at rescue. Additional British troops were quartered in the city during the summer. A deputation of Greek members of the Legislative Council visited London in July to plead for redress of grievances.

DAHLGREN, CHARLES BUNKER. An American soldier, died January 10, 1912. He was born in 1839, a son of the late Rear-Admiral John A. Dahlgren. He served with his father in the blockade of Charleston and after the war was assistant at the Washington Navy Yard. He wrote a number of books dealing with naval warfare.

DAHN, FELIX SOHUS JULIUS. A German historian, novelist, and poet, died January 3, 1912. He was born in Hamburg in 1834 and studied in the universities of Munich and Berlin. He devoted himself chiefly to history and law. He became *privat docent* in Munich in 1857 and professor of law in that university in 1864. He afterwards occupied the same position at Würzburg, Königsberg, and Breslau. He filled the chair of history and law at the latter institution from 1888 until the time of his death. His works on historical subjects are important, but he is best known as novelist and poet. *Der Kampf um Rom* in four volumes passed through more than thirty editions. Among his other works his epic poem, *Sind Götter?* and *Moltke als Erzieher* are well

known. He also wrote a number of dramas. His novels are of the historical type and cover periods from prehistoric times to the Crusades.

DAHOMEY. A French West African colony. Capital, Porto Novo, with 40,000 inhabitants; other towns are: Abomey (10,732), Ouidah or Whydah (13,000), Grand Popo (2115), and Cotonou (1954). A railway (748 kilometers), which, when completed, will connect Cotonou with the Niger at a point near Karimana, is finished as far as Savé (261 kms.). Construction was under way in 1912. The line has three main sections: Cotonou to Paouignan, 194 kms.; Paouignan to Parakou, 246; Parakou to the Niger, 250. A branch from Cotonou (58 kms.) runs to Ouidah (Whydah) and Segboroué. The chief products and exports are palm kernels (export 1909, 8,353,252 francs), palm oil (6,452,109), corn (712,713), live animals (151,378), copra (99,420), cotton (130,078). Ch. Noufiard was lieutenant-governor in 1912. See FRENCH WEST AFRICA.

DAIRYING. The farm value of the dairy products of the United States in 1912 was estimated to be about \$830,000,000. A severe drought prevailed in the early summer throughout the East, but copious rains later improved pastures so that the output of butter in creameries was larger than for several years previous. The price of butter increased about 11 per cent. over 1911, and the price of milk 5 per cent. The imports of butter and butter substitutes into the United States during the fiscal year ended June 30, 1912, amounted to 1,025,668 pounds, valued at \$237,154. The exports amounted to 6,092,235 pounds, valued at \$1,468,432. The cheese imports totaled 46,542,007 pounds, valued at \$8,807,249. The cheese exports amounted to 6,337,559 pounds, valued at \$898,035.

As in 1911, the cost of milk production averaged so high as to drive many men out of the dairy business. The New York and New Jersey Experiment Stations report that it cost about 4 cents per quart to make milk. The Minnesota Experiment Station found the cost of producing milk in Minnesota was so high that the income received from milk and butter was not sufficient to cover the cost of production on most farms. In a five-year test at the Connecticut Experiment Station it was concluded that even from a good herd milk could not be produced at a profit at 4 cents per quart. The Ohio Experiment Station found that it cost 6¼ cents per quart to produce milk in Ohio, and the cost of delivering was 3½ cents per quart, making a total cost of milk in Ohio at 9¼ cents, which allowed for no profit to the producer. A Boston firm estimated that the cost of delivering a quart of milk to the consumer was 4.4 cents, to which must be added 0.37 cent for shrinkage. The average price to the producer for milk delivered in Boston was 3.9 cents per quart, making a net cost per quart when delivered to the consumer of 8.67 cents. The New York State Food Commission found that the cash margin between cost price and retail selling price was as follows: Fresh milk, 71.5 per cent.; creamery butter, 16.9 per cent.; whole milk cheese, 28.13 per cent., and condensed milk, 22.7 per cent. During the year the previous high yields of milk of the Guernsey, Brown Swiss, Ayrshire, and Holstein breeds have been exceeded. The largest yield was that of Creamelle Vale,

a Holstein cow, which produced 29,625 pounds of milk in one year.

An act of Congress August 10, 1912, provided that the sanitary regulations for slaughtering and canning meat be extended to cover renovated butter factories. Outbreaks of typhoid fever, septic sore throat, and other milk-borne diseases have stimulated the health authorities to continue their efforts in the sanitary regulation of the milk supply.

Dr. Delepine has made a statistical study of the tuberculous milk recently in the city of Manchester, England, and finds that the quantity of such milk has been reduced to nearly one-third of that of fourteen years ago. Infantile mortality, though still high, has considerably decreased in that time, which in part is attributed to the reduction in the amount of tuberculous milk.

In view of the fact that tubercle bacilli are found in butter and cheese, it has been advocated that a certified butter made from pasteurized cream should be put on the market, and that it would probably pay as soon as the public could be taught the value of using a sanitary product. There is a steadily expanding demand at all seasons of the year for the highest grade of unsalted butter at the largest distributing markets. As defects in cream are more noticeable in fresh than in salted butter, none but the best cream and methods of butter making can be employed in the production of the unsalted product. This is an additional reason for the pasteurization of a larger percentage of the cream which is made into butter. Experiments with ozone in the preservation of milk have not proved satisfactory; many bacteria were destroyed, but not enough to be efficient for preservation. Several new patents have been granted by the French government for the sterilization of milk by ultra-violet rays. In one case the milk is quickly raised to a temperature of 60° C., then submitted to the action of ultra-violet rays by exposure to radiations of a quartz vapor mercury lamp, working at 3 amperes and 220 volts. A new product known as "Syntho" and resembling cream is found on the Chicago market, and is made by emulsifying melted beef tallow in milk. A method of making a synthetic milk has also been reported from Germany. A decision of importance to the dairy interests was made by the Appellate Division of the New York Supreme Court, which declared that the sale of oleo is illegal when the color of the substitute resembles butter. This is a reversal of the decision of the lower courts.

The dairy industry is expanding in Canada, but not enough butter is produced to supply the home demand. During the year over 2,000,000 pounds of butter were imported to Canada from New Zealand. There was a decline in exports of cheese and cream from Canada to the United States. An excessive hot and dry summer in the United Kingdom caused a greater reduction in the number of cows kept, so that the amount of milk and milk products produced was very much reduced. The local government board of England and Wales has issued an order allowing the use of boric acid, borax, or hydrogen peroxid as a preservative of cream containing more than 35 per cent. fat, but no preservative can be added to market milk or thin cream, nor can any thickening substance be added to cream. The production

of condensed and powdered milk is assuming great importance in New Zealand, which now sends about 200,000 pounds each year to the United Kingdom, besides other shipments to Australia and the South Sea Islands. The New Zealand method of evaporating milk to the powdered form has been introduced into Australia, where a great development of this industry is expected.

The following treatises on dairying have been published during the year: *Report of the Commission on Milk Standards Appointed by the New York Milk Committee* (Pub. Health and Mar. Hosp. Serv. U. S., Pub. Health Rpts., 27 (1912), No. 19, pp. 673-691; reprinted as Reprint No. 78); E. V. Wilcox, *Production and Inspection of Milk* (Hawaii Sta. [Spec. Bul.], 1912, July 31); T. P. Cooper, *The Cost of Producing Minnesota Dairy Products, 1904-1908* (Minnesota Sta. Bul. 124; U. S. Dept. Agr., Bur. Statis. Bul. 88); B. Marquart, *Lehrbuch des Milchvieh-Kontrollwesens* (Berlin); G. A. Witt, *Die heittechnischen Einrichtungen der Käserei* (Bern); A. Monvoisin, *Le Lait, son Analyse, son Utilization* (Paris); J. P. Sheldon, *Dairying: A Book for All Who Are Engaged in the Production and Management of Milk* (London); C. Porcher, *Le Lait desséché* (Lyon); W. G. Savage, *Milk and the Public Health* (London); M. J. Rosenau, *The Milk Question* (Boston); M. A. O'Callaghan, *Dairying in Australasia*; W. Sadler, *Bacteria as Friends and Foes of the Dairy Farmer* (London); K. Storen, *Dairying* (Christiania); J. Michels, *Market Dairying and Milk Products* (Wauwatosa, Wis.).

DALE, THOMAS HENRY. Former congressman from Pennsylvania, died August 21, 1912. He was born in Daleville, Pa., in 1846 and was educated in the public schools of that town and at Wyoming Seminary. He enlisted in the volunteers at the outbreak of the Civil War. From 1870 to 1901 he was engaged in the wholesale produce and coal business in Scranton. He afterwards became president of the Anthracite Trust Company, and several other corporations. He was elected prothonotary of Lackawanna County in 1882, 1885, and 1888, and was elected to the 59th Congress in 1905.

DALEN, GUSTAF. See NOBEL PRIZE.

DALRYMPLE-HAY, SIR JOHN CHARLES. An English admiral, died January 28, 1912. He was born in Edinburgh in 1821. After a year spent at Rugby he entered the navy in 1834, and after an eighteen months' cruise on the African station he went for three months to the Pacific. He next served in the *Benbow* in the Mediterranean. As lieutenant he served in China, for a portion of the time as flag-lieutenant to Sir Thomas Cochrane, who, in 1846, promoted him to the command of the *Wolverine*. His next service was again in China, where in 1849 he did excellent service against pirates. In that year he defeated Shaping-tzai, a noted pirate who had assembled a fleet of sixty-four large junks in the Tongking River. These junks were nearly all destroyed. As a result of this service Hay was promoted to the rank of captain in 1850. In 1854 he commanded the *Victory* at Portsmouth, and in the two years following served in the Black Sea and on the North America and West Indies station. In 1861 he succeeded to the baronetcy, and in the following year was returned to parliament as a Liberal Conservative. He

retained his seat for three years, but was defeated in 1865. In 1866 he was made rear-admiral, and in the same year he again returned to parliament. He held this seat until April, 1880, when he was defeated. In July of the same year he occupied a seat which had become vacant. As a result of the so-called Childers retirement scheme, which came into force in 1870, Admiral Hay was obliged to retire from active service at the age of 49. In 1873 he became a vice-admiral on the retired list and in 1878 was made full admiral. For sixteen years after his retirement he continued to sit in the House of Commons, where he took an active part in questions relating to the navy. In 1885 he did not seek re-election, and from that year until the time of his death lived in retirement. He received the degree of honorary D. C. L. from Oxford, and honorary LL. D. from Glasgow universities. He was a Fellow of the Royal Society and vice-president of the Institute of Naval Architects. He wrote *The Flag List and Its Prospects* (1870); *Ashanti and the Gold Coast* (1873); *Our Naval Deficiencies* (1883); *Piracy in the China Sea* (1889), and a volume of reminiscences entitled *Lines from My Log-Books* (1898).

DAMASCUS. See ARCHÆOLOGY.

DAMS. The failures of dams with great loss of life and damage throughout the United States directed attention in 1912 to the necessity for State regulation of their construction and maintenance. There were on the statute books laws to provide for the supervision of dams and reservoirs in the following twenty-seven States: Colorado, Connecticut, Florida, Georgia, Idaho, Indiana, Kansas, Maine, Massachusetts, Michigan, Montana, Nebraska, Nevada, New Jersey, New Mexico, New York, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, and Wyoming. The statutes in these various States represented widely differing methods and extent of supervision and control. Fifteen provide for State supervision and twelve place the control in the hands of local officers. In Colorado the preliminary approval of plans and specifications of dams and reservoirs must be made by a State engineer and the construction supervised, a permit for use not being granted until a certificate for operation is obtained. In New York during the year an active inspection of various dam sites was made, and in other States efforts towards the proper inspection and regulation of dams and reservoirs were under way. It was found that poor engineering and faulty construction were responsible for a number of the failures, and civil engineers were paying increased attention to the problems of construction, especially the foundations of dams and endeavoring to eliminate the false economy by which many builders were attempting to reduce the cost.

ARROWROCK DAM. Plans for what was to be the highest masonry dam in the world were prepared for the United States Reclamation Service in connection with the Arrowrock reservoir for the Boise project. This dam was to be located in the canyon of the Boise River about twenty miles above the City of Boise, Idaho, and was to rise to a height of 350 feet, with a concrete masonry spillway. It was to be 1050 feet in length on the top and its foundations would go down some eighty or

ninety feet below the bed of the river at their lowest points. The dam was to be of the gravity type, curved in plan, built of concrete by the officials of the United States Reclamation Service. There was provided in the plans as a spillway a concrete weir about 400 feet in length discharging into a channel passing around the north end of the dam and into a creek below. During the construction the diversion works were to consist of two crib cofferdams across the Boise River, with a channel about 490 feet in length and a cross-sectional area of about 670 square feet.

BUTTE DAM. Another gravity type of dam was designed for the Rio Grande project, New Mexico-Texas, at Elephant Butte, New Mexico. The top of this dam, which was to extend about 1200 feet in length and carry a roadway, was to be 200 feet above the original river bed. The dam, with a dike about 1½ miles northwest, was to form a reservoir with a capacity of 2,600,000 acre-feet. The dam was to be of concrete in which were to be imbedded rough stones of various sizes up to about four cubic yards each, and the foundations were to be made in rock excavations. This work also was to be done by government forces of the Reclamation Service and the detailed specifications provided for a structure of massive design and construction.

FAILURE OF OHIO RIVER DAM No. 26. The corps of engineers of the United States army during the year was actively engaged in the improvement of the entire Ohio River by the construction of locks and movable dams with a view to securing a navigable depth of nine feet. Dam No. 26, across the Ohio River below Gallipolis, was completed during the year and on August 8, 1912, one day after the water was let in behind it, it was destroyed and a loss estimated at \$60,000 was caused. This dam consisted of a lock, two bear-trap dams, and a 600-foot section of movable Chanoine wickets which were built on a concrete base resting on the shale bottom of the river. This shale foundation proved defective and the concrete bases were shoved off and the wickets carried down stream.

ASSUAN DAM. This great structure to control the waters of the Nile was completed during the year and formally opened on December 23 in the presence of Lord Kitchener, the Khedive, and other distinguished guests. After the dam had been built it was found desirable to increase its height and strengthen the structure and this last work had been in progress since 1909. Sir Benjamin Baker, the original engineer, decided that the original structure, which was finished in 1903, could be raised to increase the amount of water stored at Assuan and accordingly plans were prepared which provided for increasing the height of the masonry crest by 16.4 feet and the water level by 23 feet, as well as thickening the dam by 16 feet. The storage capacity thus obtained was increased from 35,300 million cubic feet to 81,190 million cubic feet and the estimated cost of the structure was £1,500,000. The contract was placed in 1907. The new masonry was built in front of the old, leaving an interval into which cement grouting could be run when the temperature of both masses had become the same. The new dam has a thickness at the top of 36 feet, as compared with 23 feet for the older structure and carries a driveway of

29 feet 6 inches in width, as against a former width of 18 feet 4 inches. Heavy locks and control works were installed, and the additions from an engineering standpoint were in keeping with the monumental character of the original work. Raising the level of water covered quite a few archaeological remains, and these were all carefully studied and excavated, inscriptions being copied and records and measurements made.

KLINGENBERG DAM. A massive masonry dam in which architectural features were introduced, was under construction during the year at Klingenberg, in Saxony. This dam was 1,033.5 feet in length, 131.2 feet high and 113.5 feet thick at the base. It spans the valley of the Wild Weisseritz and was to impound the water for a distance of $2\frac{1}{2}$ miles back. The stone used in the construction is gneiss, obtained from a nearby quarry, and 156,954 cubic yards were required in the construction. The architectural features were designed by Prof. Hans Poelzig, of Breslau, and involved supporting the lower masonry by buttresses, a central tower with a turreted effect, and a suggestion of arches along the extent of the dam.

See also **AQUEDUCTS** for description of *Kensico Dam*.

DANBURY HATTERS' CASE. See **BOYCOTT**.

DANISH WEST INDIES. Three West Indian islands (St. Croix, 84 square miles, 15,467 inhabitants; St. Thomas, 33 and 10,878; St. John, 21 and 941), which compose a colony of Denmark. Negroes form the majority of the population, and the cultivation of sugarcane is the chief industry. Governor in 1912, L. C. Helwez-Larsen; government seat, Charlotte Amalie (St. Thomas).

DARTMOUTH COLLEGE. The total number of students enrolled in the various departments of the college in the autumn of 1912 was about 1300. The faculty numbered 137. The noteworthy changes in the faculty during the year included the appointments of E. G. Bill, assistant professor of mathematics, E. R. Greene, assistant professor of French, and Rev. Benjamin T. Marshall, Phillips professor of Biblical history and literature. There were no noteworthy benefactions during the year. The productive funds of the college amounted to \$3,715,804 and the income to \$176,281. The volumes in the library numbered about 125,000. President, Ernest Fox Nichols, LL. D.

DARWIN, SIR GEORGE HOWARD. An English scientist, second son of Charles Darwin, died December 7, 1912. He was born in Down, Kent, in 1845 and was educated privately and at Trinity College, Cambridge. He studied law and became a barrister in 1874, but returned to Cambridge and devoted himself to the study of mathematical science, especially the mechanics of tides and the form of the earth. In this field he became known as an authority. He read and published numerous scientific papers. Among these were several relating to the marriage of first cousins. He also wrote on *Harmonic Analysis of Tide Observations*, *Effects of Tidal Friction on the Earth*, and on the moon and periodic orbits. He also made studies in evolution and these studies he said at one time led him to doubt whether biologists had been correct in looking for continuous transformation of species. He thought that judging by analogy they should rather expect

to find slight continuous changes in species occurring during a long period, followed by a somewhat sudden transformation into a new species or by rapid extinction. In 1906 he attended the two hundredth anniversary of the birth of Benjamin Franklin in the United States. In 1899 he was made president of the Royal Astronomical Society and six years later was president of the British Association.

DAVENPORT, HOMER CALVIN. An American cartoonist, died May 2, 1912. He was born in Silverton, Ore., in 1867, and was reared on a farm in that State. He had no school education nor did he ever study art. His early days included employment as a jockey, as a railroad fireman and as a clown in a circus. He had a remarkable taste for caricature from his boyhood and he developed this by constant practice and close observation. For a time he worked on the *Portland Oregonian* and then went to San Francisco, where in 1892 he secured employment on the *Examiner* in that city. Three years later he was brought by W. R. Hearst, the owner of the paper, to New York, and began to draw the cartoons for the *New York Journal*, which made him famous. His drawings during the campaign for the first election of President McKinley created wide attention, especially his caricatures of Mark Hanna and his conception of the trusts. He traveled widely and made pictures of many famous men, including William E. Gladstone. During the successive political campaigns he drew pictures which attracted wide attention. He had great interest in full-blooded Arabian horses and imported a considerable number to the United States. He delivered lectures on the general subject of humane treatment of dumb animals. He was the author of *Davenport's Cartoons*; *The Bell of Silverton*, and *Other Short Stories of Oregon*, and *The Dollar or the Man?*

DAWSON, THOMAS CLELAND. An American diplomat, died May 1, 1912. He was born in Hudson, Wis., in 1865, and graduated from Hanover College in 1883. He studied law at Harvard University and at Cincinnati Law School. For several years he was engaged in journalism and after his admission to the bar practiced law from 1886 to 1889 in Des Moines, Ia. In 1890 he again entered journalism as legislative correspondent of the *Iowa Daily Register*. He later became city editor of that paper. From 1891 to 1897 he practiced law at Council Bluffs, Ia., and from 1891 to 1894 was attorney-general of the State. In 1897 he was appointed secretary of the United States Legation to Brazil, and five times acted as chargé d'affaires of the legation. He was consul-general of the United States to Santo Domingo from 1904 to 1907, and was minister to Colombia from 1907 to 1909, and to Chile from 1909 to 1910. In 1910 he was appointed chief of the Division of Latin-American Affairs in the United States State Department. Mr. Dawson won a remarkable reputation as a pacifier in disputes between Latin-American countries. He did especially efficient work in Santo Domingo and in Panama following the separation of that republic from Colombia. He did important work also in Nicaragua and Honduras. In 1911 he was peace commissioner to Honduras, and in June of that year represented the United States at the centennial celebration of Venezuelan independence. Mr. Dawson was offered the post of ambassador to Brazil, but declined.

DEATH RATE. See VITAL STATISTICS.

DEBT. See articles on countries.

DEEP SEA EXPLORATION. See CARNEGIE INSTITUTION.

DELAWARE. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population of 202,322 in 1910, the foreign-born whites numbered 17,420, compared with 13,729 in 1900. The largest proportion of these, 3984, came from Ireland; from Russia, 3428; from Italy, 2893; from Germany, 2572, and from England, 1555. Other European countries were represented by smaller numbers. In 1910 the negroes in the State numbered 31,181 and the mulattoes, 3706. In 1890 the negroes numbered 28,386 and the mulattoes, 3549.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911-1912 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn	1912	195,000	6,630,000	\$3,381,000
	1911	195,900	6,630,000	4,044,000
Wheat	1912	111,000	1,942,000	1,864,000
	1911	113,000	1,887,000	1,698,000
Oats	1912	4,000	122,000	55,000
	1911	4,000	120,000	56,000
Rye	1912	1,000	14,000	11,000
	1911	1,000	15,000	14,000
Potatoes ..	1912	11,000	1,100,000	770,300
	1911	11,000	660,000	634,300
Hay.	1912	72,000	a 96,000	1,440,000
	1911	72,000	a 63,000	1,418,000

a Tons.

MANUFACTURES. The Thirteenth Census included statistics for the manufacturing industries of the State. These are for the calendar year 1909 and the general results will be found in the table below. The largest number of men employed in any single industry are those engaged in the tanning of leather. These number 3045. The manufacture of foundry and machine shop products gave employment to 2210 wage earners; the paper and wood pulp industry to 1525; canning and preserving to 1369; shipbuilding to 1239, and lumber and timber production to 1174. These are the only industries giving employment to more than 1000 men, with the exception of those employed by the railroads in the car shops and elsewhere, who numbered 2210. Of all the persons engaged in the manufacturing industries of the State, 5.8 per cent. were officials, 5.7 per cent. clerks, and 88.6 per cent. wage earners. Of the clerks employed, 81.8 per cent. were male and 18.2 were female, and of the wage earners, 82.4 per cent. were male and 17.6 per cent. were female. Of the total number employed 97.5 per cent. were sixteen years old and over, and 2.5 per cent. were under sixteen. The largest number of women and children are employed in the canning and preserving industry. For the great majority of the wage earners employed in the manufacturing industries of the State the prevailing hours of labor range from fifty-four to sixty hours per week, or from nine to ten hours a day, only 8 per cent. of the total being employed in establishments working less than nine hours a day, and only 4.5 per cent. being employed in establishments working more than ten hours a day.

The following table gives a summary of the results of the census for the calendar years 1909 and 1904:

	Number of 1909	amount 1904
Number of establishments..	726	631
Persons engaged in manufactures	28,984	20,567
Proprietors and firm members	722	641
Salaried employees.....	2,024	1,451
Wage earners (average number).....	21,238	18,475
Primary horsepower.....	52,779	49,490
Capital	\$60,906,000	\$50,928,000
Expenses	46,958,000	37,362,300
Services	12,618,000	9,787,000
Salaries	2,322,300	1,629,000
Wages	10,296,000	8,158,000
Materials	30,938,000	24,884,000
Miscellaneous	3,402,000	2,691,000
Value of products.....	52,840,000	41,160,000
Value added by manufacture (value of products less cost of materials)...	21,902,000	16,276,000

FINANCE. The report of the State treasurer for the fiscal year 1912 shows: Cash balance at beginning of year, \$49,986.91; cash receipts for year (including balance), \$893,558.49; cash expenditures for year, \$801,210.85; cash balance at close of year, \$92,347.64.

The total bonded debt is \$826,785, and the total assets are \$2,004,583.49.

The chief sources of revenue are railroads—State tax, \$112,000; corporations—organization tax, \$105,693.01; corporations—annual franchise tax, \$62,551.25.

The chief expenditures are for educational purposes, \$254,078.19; charities and eleemosynary institutions, \$94,981.49; public health, \$31,814.88; executive department of government, \$54,658.21 (salary and expenses of State officers, etc.); department of justice, \$42,611.67 (salaries of judges, attorney-general, and expenses of department, etc.).

POLITICS AND GOVERNMENT. There was no session of the legislature in 1912, as the sessions are biennial and the last was held in 1911.

CONVENTIONS AND ELECTIONS. There was an election for governor and other State officers, and representatives to Congress on November 5. The Republican State convention for the election of delegates to the national convention was held on April 16. The convention indorsed President Taft, but sent the six delegates to Chicago unpledged and free to act on personal judgment. A vigorous debate occurred in the convention over a proposal to increase the negro representation on the State committee, the negroes demanding that the committee be increased from 12 to 16 members, four to be negroes. The proposal was defeated. The delegates elected to the Democratic State convention were pledged to Governor Wilson. The first Progressive convention held in the State convened on July 31. Six delegates were elected to the Progressive convention in Chicago. The platform denounced the action of the managers and delegates to the Chicago convention and said: "We emphatically condemn those delegates from Delaware who assisted in the perpetration of this fraud on popular government." The platform also condemned the Senators from Delaware for their support of Senator Lorimer. The Republican State convention for the nomination of State officers and representatives to Congress met at Dover on August 20. Charles R. Miller of Wilmington was nominated for governor and George H. Hall of Milford for representative to Congress. On September 10 the Democratic

nominees to the convention nominated Thomas W. Monaghan for governor and on the following day the Progressive party nominated George B. Hynson. A division occurred in the Progressive party as the result of the assumption of leadership by representatives of the former régime of Senator Addicks. J. Frank Allee was one of the leaders. This was so displeasing to the followers of Mr. Roosevelt in Wilmington, where a large majority of the Progressive party existed in Delaware, that they bolted from the Progressive State convention held on September 11, and formed another party under the title of the National Progressive party. Instead of indorsing George H. Hall, the Republican nominee for Congress, the National Progressives nominated John G. Townsend, Jr., of Selbyville. They accepted the three Roosevelt electors nominated by the original Progressive convention. This made four candidates for Congressman in Delaware, including the regular Republican nominee, the Democratic nominee, the regular Progressive nominee, and the National Progressive nominee. The vote on November 5 resulted in the election of Mr. Miller, Republican candidate for governor. His vote was 22,745, while for Mr. Monaghan, the Democratic candidate, were cast 21,460, and for Hynson, Progressive, 3019 votes. The vote for President was as follows: Wilson, 22,631; Taft, 15,997; Roosevelt, 8886; and Debs, 556. The candidate of the Prohibition party for governor, John Heyd, received 622 votes, and Rearick, Socialist, 555 votes.

OTHER EVENTS. On February 13 President Taft withdrew the nomination of Cornelius P. Swain to be United States marshal for the district of Delaware. This action was due to an investigation of alleged political corruption in Delaware. The withdrawal was the result of a request by Senator Du Pont to Attorney-General Wickersham. Mr. Swain's nomination was once confirmed by the Senate, but the action was reconsidered on receipt of the complaint from Willard Saulsbury of the national Democratic committee for Delaware. Mr. Saulsbury alleged that Swain was unfit for public office because he had been implicated in buying votes in Sussex County. The specific charge was that Swain had taken \$3000 from the office of T. Coleman Du Pont of Wilmington to Bridgeville, where it was used for corrupt purposes in the election of 1904. As a result of these charges, which implicated Senator Du Pont, the latter asked for an investigation by a committee of the Senate. No action had been taken on this at the end of the year.

DENMARK. A constitutional European monarchy situated north of Germany. Copenhagen is the capital.

AREA AND POPULATION. The area and population by insular and mainland divisions, according to the census taken February 1, 1911, compared with the figures for population in 1906, are shown in the following table:

	Sq. Miles	Pop. 1906	Pop. 1911
Islands:			
Seeland	2,895	1,026,119	1,096,897
Bornhohn	227	41,031	42,885
Lolland-Falster	692	108,029	115,658
Fyn	1,341	289,346	303,179
Jutland:			
Southeast Jutland..	2,827	452,445	482,264
Southwest Jutland..	4,144	338,224	364,620
North Jutland.....	2,920	334,005	351,573
Total Denmark proper.	15,046	2,588,919	2,757,076
Faroe Islands.....	540	16,348	18,000
Total	15,586	2,605,267	2,775,076

The males in 1911 numbered 1,337,900 and the females 1,419,176 (1,257,765 and 1,331,154 in 1906). The rural population in 1911 numbered 1,647,350, as compared with 1,565,585, an increase of 81,765; the urban, 1,109,726, as compared with 1,023,334, a gain of 86,392. Copenhagen (København), covering 28 square miles, had (1911) 462,161 inhabitants; Frederiksberg, 97,237; Aarhus, 61,755; Odense, 42,237; Aalborg, 33,449; Horsens, 23,843; Randers, 22,970; Esbjerg, 18,208; Vejle, 17,261; Fredericia, 14,228; Kolding, 14,219; Helsingør, 13,783; Svendborg, 12,667; Nykøbing, 11,010; Viborg, 10,885.

PRODUCTION. Agriculture and dairying are the principal industries. About 80 per cent. of the total area is productive; less than one-half the productive area is under crop, the remainder being forest, pasture, and meadow. The table below gives area (in hectares) and production (in quintals) of the main crops in 1911 and 1912, with yield per hectare in 1911:

	Hectares		Quintals		Qs.
	1911	1912	1911	1912	ha.
Wheat ..	40,512	40,512	1,216,157	1,018,777	30.0
Rye	276,009	276,009	5,007,279	4,670,173	18.1
Barley.....	233,714	233,714	5,013,129	4,676,095	21.4
Oats	402,939	402,939	7,332,941	7,647,923	18.1
Beets* ..	24,900	30,300	7,304,799	8,035,279	233.4
Tobacco ..	65	65	1,170	18.0
* Sugar beets.					

The 1912 autumn sowings were retarded by a late harvest and wet weather.

Livestock estimate, July, 1910: 535,018 horses, 2,253,982 cattle, 726,829 sheep, 40,257 goats, 1,467,822 swine.

Beet-sugar production (1910), 100,510 tons (8 mills); there were 28 distilleries (15,010,000 liters 100°), and 22 margarine, etc., factories (34,320 tons output). Fisheries products were valued at £769,126.

COMMERCE, ETC. The general and special trade by great classes in 1910 is shown below (in thousands of kroner):

	Imports		Exports	
	Gen.	Spec.	Gen.	Spec.
Provisions	234,400	173,857	466,083	434,537
Raw products.....	259,373	243,678	63,192	45,194
Manures, etc.	65,175	62,963	6,912	4,462
Fuel	45,058	40,561	5,867	8
Other*	60,401	56,020	6,020	1,173
	634,407	577,166	548,074	485,374

* Includes goods for personal and household use.

Principal exports (special trade), values in thousands of kroner: Provisions, eggs, etc., 368,026; animals, 51,797; beverages, 13,078; cereals, etc., 10,789; metals and hardware,

5230; colonial goods, 1747; wood and wooden-ware, 787; textile mfrs., 552.

Principal countries of origin and destination, general trade, values in thousands of kroner:

	Imports		Exports	
	1909	1910	1909	1910
Germany	266,039	241,556	133,061	124,511
United Kingdom.....	113,502	117,232	329,567	341,418
Sweden	58,274	56,304	39,542	23,139
United States.....	86,196	51,692	31,126	4,844
Russia	83,248	49,219	29,838	7,992
France	16,261	15,843	1,026	2,736
Netherlands	22,094	14,502	2,099	3,291
Belgium	10,417	8,230	1,981	2,100

Total general (1911): 705,500,000 kroner imports and 626,761,000 kroner exports; total special, 623,314,000 imports and 536,647,000 exports.

Vessels entered in the 1911 trade, 35,873, of 4,015,804 tons (coasting, 98,112, of 1,876,909); cleared, 36,238, of 1,513,632 (98,001, of 1,831,221). Merchant marine (January 1, 1912), 3562 vessels, of 513,081 tons.

Railways in operation at end of 1910, 2120 miles (1212 miles state-owned).

ARMY. The contingent of recruits required for the Danish army in 1912 was the same as in the previous year, namely, 8000 infantry, 600 cavalry, 1600 artillery, and 300 engineers. From the various recruits a force is maintained with the colors of over 11,000 men, the establishment consisting of about 830 officers and 13,000 men on a peace footing. The organization consists of 52 battalions of infantry (31 line and 21 reserve), 12 squadrons of cavalry, 24 field batteries, 18 coast batteries (12 line and 6 reserve), and 12 companies of engineers. These formations are maintained on a skeleton basis, but they were arranged so that Denmark can mobilize 83,000 men, of whom 58,500 would be infantry, 5000 cavalry, 6800 field artillery, and 8600 fortress artillery, forming an effective force of about 70,000. In 1912 the permanent staff consisted of 12 generals, 92 superior officers, 630 junior officers, and 1663 non-commissioned officers. Military service was obligatory on all able-bodied men who had attained the age of 22.

NAVY. The fleet, maintained for purposes of coast defense, is composed of three monitors carrying, each, two 9.4-inch and four 6-inch guns, and one carrying one 9.4 and three 4.7; three torpedo gunboats; 14 first-class torpedo boats 3 submarines; besides an old battleship, a cruiser, and some small craft.

FINANCE. The budget for the financial year 1912-13 estimated the revenue at 97,838,034 kroner (taxes and duties, 83,586,400) and the expenditure at 101,745,054 (war, 19,766,655; worship and instruction, 14,873,788; interior, 13,059,811; marine, 11,159,013; debt, 9,366,866; justice, 9,707,000; finance, 7,635,918). The debt stood (March 31, 1912) at 351,978,008 (external, 270,467,250; internal, 81,510,758).

GOVERNMENT. The king is the executive, assisted by a ministry of eight members, appointed by him and responsible to the parliament or rigsdag. This body is made up of an upper house of 54 and a lower of 114 members. Reigning sovereign (1912), Christian Charles Frederick Albert Alexander William, born September 26, 1870; married, April 26, 1898, to Alexandrine, Duchess of Mecklenburg (born December 24, 1879); was proclaimed king (Chris-

tion X.) May 15, 1912, upon the death (May 14) of his father, King Frederick VIII. Heir-apparent, Prince Christian Frederick Francis Michael (born March 11, 1899). The ministry (constituted July 5, 1910) was in 1912 composed as follows: K. Berntsen, premier and minister for defense; C. W. (Count) von Ahlefeldt-Laurvig, foreign affairs; A. Nielsen, agriculture; J. Appel, worship and instruction; T. Larsen, public works; J. Jensen-Sønderup, interior; N. T. Neergaard, finance; O. H. V. B. Muus, commerce, etc.; F. T. von Bülow, justice.

HISTORY. A debate on the foreign policy of the government occurred in the middle of February. The foreign minister, Count Ahlefeldt, asserted that the policy of Denmark in foreign affairs consisted in absolute neutrality towards foreign powers and no special intimacy with any one. A vote on this speech resulted in an expression of agreement with these principles by all the parties in the parliament. The King of Denmark died suddenly on the street at Hamburg on the night of May 14. He was walking alone, and his identity was not discovered until after the body had been taken to the mortuary. (See FREDERICK VIII.) He was succeeded by his eldest son, Christian, who was born September 26, 1870. On the opening of the parliament on October 7 the speech from the throne announced that a bill would be submitted for the amendment of the constitution with a view to making both houses more truly representative. Bills were also promised for the amelioration of social conditions, including a measure for the relief of indigent widows and widowers. The prime minister introduced the constitutional reform bill on October 23. This provided for woman suffrage and for their election to the Folkething. The age limit was reduced from 30 to 25 years. The term of parliament was increased from three to four years. It was also provided that of the 66 members of the Lands-thing, 54 should be chosen by the communal bodies and these in turn should choose the remaining 12. The admission of members by privilege or by the nomination of the king was abolished.

DENT, CLINTON THOMAS. An English surgeon, died September, 1912. He was born in 1850 and was educated at Trinity College, Cambridge. He became one of the most eminent surgeons in England and was vice-president of the College of Surgeons, senior surgeon of St. Joseph's Hospital, and chief surgeon of the Metropolitan police force. He was, in addition, well known as a traveler and mountain climber. Among his published works are: *Explorations in the Caucasus*; *Above the Snow Line*, and many writings on Alpine and medical subjects in magazines.

DENTAL SCHOOLS. See UNIVERSITIES AND COLLEGES.

DE PAUW UNIVERSITY. An institution of higher learning at Greencastle, Ind., founded in 1837. The total enrollment in the autumn of 1912 was 1115. The faculty numbered 53. The most important event in the history of the university during the year was the resignation of President Francis J. McConnell, LL. D., as president of the university and the election of Rev. George Richmond Grose, D. D., as his successor. Dr. McConnell was elected bishop in the Methodist Episcopal Church. The university received a bequest of

\$250,000 from Simeon Smith, of Bloomfield, Ind. The productive funds of the university at the end of the year 1911-12 amounted to \$562,817, and the income for the year to \$83,972. The library contained 30,000 volumes.

DERAILMENTS. See RAILWAY ACCIDENTS.

DESCLAUZAS, MARIE. A French actress, died in April, 1912. She was born in Paris in 1840. Her first appearance on the stage was made in Rheims, but she soon returned to Paris and her experience was, for the most part, identified with that city, except for a time spent in Russia, where she was very popular. She visited America and was successful in the operettas of Offenbach and Lecocq. She also played in Brussels, where she created the part of Mlle. Lange in *La fille de Madame Angot*. Among other plays in which she appeared with great success in Paris were *Sapho*, *L'Abbé Constantin*, and *Musotte*. In her later years she was a member of the Gymnase.

DESIGN, NATIONAL ACADEMY OF. See PAINTING.

DESPRADELLE, CONSTANT DÉSIRÉ. An American architect, died September 4, 1912. He was born in Burgoyne, France, in 1862, and graduated at the Ecole des Beaux Arts in 1882. For several years following he studied architecture at that school. He won several important prizes in architectural composition and in 1890 was appointed architect *diplômé* of the French government. From 1889 to 1893 he was inspector of State buildings and national palaces in France. In the latter year he was appointed Rotch professor of architectural design at the Massachusetts Institute of Technology and at the same time became a member of the firm of Codman and Despradelle. He received one of the first five awards in the Phoebe A. Hearst competition for the University of California in 1899 and was given the first gold medal at the Salon in Paris for the design of a monument, "The Beacon of Progress," to glorify the American nation. Two of these drawings were purchased by the French government for the Luxembourg. In 1906 he was appointed consulting architect of the Museum of Fine Arts, in Boston. In 1910 he became corresponding member of the Institute of France, Académie des Beaux Arts. He was a member of many American and foreign architectural societies.

DESTROYERS. See NAVAL PROGRESS, *Great Britain, United States, Germany, General Progress.*

DETAILLE, JEAN BAPTISTE EDOUARD. A French painter, died December 24, 1912. He was born in Paris in 1848. He studied painting under Meissonier and his earlier works reflected the influence of that master. He secured a medal in 1869 with a painting called "Repose During Drill in Camp St. Maur." He took part in the Franco-Prussian War and during its progress made sketches of scenes incident to camp and campaign life. In 1877 he exhibited the famous picture "Salute to the Wounded." Another well-known canvas is "Movement of Troops." "The Passing Regiment," painted in 1875, is familiar through reproductions. This is the property of the Corcoran Art Gallery in Washington. In the Metropolitan Museum in New York are three of his works, including "The Defense of Campagna." This was considered by the artist his

best work. The Vanderbilt collection in New York has also three of his paintings. He was a chevalier of the Legion of Honor.

DETROIT. See MICHIGAN.

DEWITT, DAVID MILLER. An American public official, formerly member of Congress from New York, died June 24, 1912. He was born in Paterson, N. J., in 1837, and graduated from Rutgers College in 1858. In the same year he was admitted to the bar. From 1862 to 1868 he was district-attorney of Ulster county, N. Y. In 1873 he was elected to the 43d Congress, serving one term. He was a member of the New York Assembly in 1883, and in 1885-6 served as surrogate of Ulster county. He was the author of *The Impeachment and Trial of Andrew Johnson* (1903), and *The Assassination of Abraham Lincoln and Its Expiation* (1909).

DIAMONDS. See METEOROLOGY; GEMS; and INTERNATIONAL METRIC CARAT.

DIAMONDS, ARTIFICIAL. See CHEMISTRY, INDUSTRIAL.

DIAZ, FELIX. See MEXICO, *History.*

DICKENS, ALFRED TENNYSON. The oldest surviving son of Charles Dickens, died January 2, 1912. He was born in London in 1845 and attended school at Boulogne and afterwards in England. When he was 20 years of age he went to Australia on the advice of his father and remained there for the greater period of his life. In 1909 he delivered a lecture in Australia on reminiscences of his father and later repeated this lecture in England, and in 1911 came to the United States for the purpose of giving lectures in various cities. Ill health compelled him to shorten his tour and he died suddenly in New York City.

DICK PATENT CASE. See TRUSTS.

DICTOGRAPH. This instrument during 1912 figured in many criminal trials, notably that of the McNamara brothers (q. v.), and was responsible for convictions in a number of cases. The instrument consists of the adoption of an ordinary telephone circuit with a sensitive granular carbon transmitter with a diaphragm somewhat greater than usually employed, so as to increase the reproduction of the sound at the receiving end of the line. Such a transmitter, small and inconspicuous, would be placed in the room where suspected persons would hold conferences or conversations and wires were led to a recording station, where a stenographer recorded the spoken words for use of the authorities. In large auditoriums a number of transmitters were used to reproduce the sounds at different parts of the hall, and a similar device with a loud speaking telephone receiver was installed in the waiting rooms of various railway stations; likewise, in business offices the dictograph was being used in connection with a phonograph, where dictation could be recorded on a cylinder for subsequent transcription by a typist. The use of the dictograph has not involved many new principles, but there have been worked out practically a number of ideas that have led to the perfection of previous devices.

DIERX, LÉON. A French poet, died June, 1912. He was born on the island of Réunion in 1838. He studied at the Central School of Arts and Manufactures at Paris and then returned to his native island as engineer. He afterwards devoted himself to the study and writing of poetry. He was given a small office

in the ministry of public instruction which enabled him to live. He joined a group of poets known as Parnassians, which included Coppée, Sully-Prudhomme, and others. In 1898 he was elected *Prince des poets* by the poets of the new generation. His published works include: *Poèmes et poésies* (1864); *Les Lèvres closes* (1867); *Poésies complètes* (1872), and the dramas, *La rencontre* (1875) and *Les Amants* (1879).

DIESEL ENGINE. See INTERNAL COMBUSTION MOTORS; FUEL OIL.

DIETETICS. See FOOD AND NUTRITION.

DIPHTHERIA. The persistence of the bacillus of diphtheria in the throats and noses of patients symptomatically recovered from an attack, as well as their frequent occurrence in well persons who have been in contact with diphtheria patients, is a serious drawback in the eradication of this disease. Such bacilli are as virulent as those found in the height of an attack and constitute a constant source of dissemination and an extremely difficult problem for the sanitarian. Antitoxin cures the disease clinically, but has little or no effect on the diphtheria carrier.

Hewlett and Nankivell studied the subject from every angle and concluded that of the current methods of dealing with carriers complete isolation has been most successful. Local and internal treatment were unsatisfactory. With a view of reaching the deeper tonsillar crypts not touched by local treatment, iodine was given until iodism resulted, but without success. As it had been found that with the disappearance of the diphtheria bacilli, an increase in the non-virulent organisms in the throat occurred, inoculation of the throat with such organisms was attempted in two cases, without result. The best results were obtained finally from the preparation of a vaccine from the *Bacillus diphtheriæ*; cultures of the bacteria were grown on serum or blood-agar; the growth was collected, washed repeatedly in normal salt solution and centrifuged; the bacteria were then ground in intense cold and passed through a Berkefeld filter. The resulting filtrate was diluted with sterile salt solution. Of five diphtheria patients injected with this vaccine while a membrane was still in the throat, four showed no bacilli after two weeks and one showed none after a month. In thirteen chronic carriers injections of the vaccine were followed by disappearance of the bacteria in a comparatively short time. In six patients the bacteria failed to disappear altogether. During the course of the investigation Hewlett and Nankivell found that scarlet fever patients who at the same time harbor the diphtheria bacillus are likely to become carriers, while those with diphtheria subsequently becoming infected with scarlet fever do not become carriers. Another investigator, Petruschky, used injections of bacteria killed with chloroform and washed. He was successful with seven chronic diphtheria carriers and was able to establish active immunity by the injection of 0.1 c. c. of a suspension of dead bacteria, followed four or five days later by the same quantity of a suspension ten times stronger. He emphasizes that such injections may be given for protective purposes, including the immunization of chronic carriers and school children carrying diphtheria bacilli in their throats.

DIVERS, EDWARD. An English chemist and educator, died April 8, 1912. He was born in London in 1837 and was educated at the Royal College of Chemistry and at Queen's College, Galway, Ireland. In 1870 he was lecturer on medical jurisprudence in the Middlesex Hospital Medical School. He was appointed professor of chemistry in the Imperial College of Engineering in Japan in 1873 and in 1882 was chosen principal of this institution. In 1902 he was vice-president of the Chemical Society and in the latter year was president of the Chemical Section of the British Association. He was president of the Society of Chemical Industry in 1905. He published many memoirs on chemical subjects.

DIVORCE. Ever since the publication of the report of the Bureau of Labor covering divorces in the United States from 1887 to 1906 and summarizing the statistics for 1867-1906, the discussion of the divorce problem has been extensive. That report showed that nearly one million divorces have been granted in twenty years; during the same period the annual number increased 160 per cent., while population increased only 50 per cent. In 1900 about 8 per cent. of all marriages were terminated by divorce, warranting the estimate that by 1912 at least 10 per cent. were thus terminated. The increasing rate is not confined to the United States, but is found in England, Germany, France, other European countries, Australia, and Japan. Contrary to popular notion, hasty marriage is not a chief cause; for marriages broken by divorces have more frequently than not lasted seven years. Moreover, desire to marry another is not often a cause. Divorce colonies, such as that at Reno, Nev., receive only a very small proportion of all those seeking divorces. While divorces arousing the greatest publicity are those of the well-to-do, the vast majority of divorces are among the middle and laboring classes. Although the ostensible grounds for 95 per cent. of all divorces are cruelty, drunkenness, infidelity, desertion, failure to support, and imprisonment for crime, it is not now generally believed by students of the problem that the increasing rate is an index of growing immorality. The foregoing six causes are only the legal grounds and do not indicate the true sociological conditions accounting for the phenomenon. Professor E. A. Ross in his *Changing America*, published early in the year, points out that divorce is a symptom of social conditions. It is caused primarily in his opinion by changes in the economic status of

women, especially the removal of many household economic activities of former days into the factory. Women are less valuable partners in the home; and they are now more able to support themselves independently. Professor Ross concludes also that intellectual changes, especially the liberation of modern thought, the growth of the ideas of democracy and individual liberty, have been potent factors in increasing divorce. The remedy is to be found not in repressing and prohibition, but in education of youth for marriage and the cultivation of rational standards of individual responsibility for racial and social welfare.

ENGLAND. The most important event of the year on the subject of divorce was the report of the Royal Commission on Divorce and Matrimonial Causes. This commission consisted of twelve distinguished persons, including two women, and spent three years in its investigations. The development of the law of divorce in England has not kept pace with that of other western nations. Previous to 1857 for more than 250 years the only manner of divorce was by act of Parliament. In that year a law established a civil court sitting at London for the hearing of divorce cases for England and Wales. As previously, however, the expenses were still prohibitive for all but fairly well-to-do persons. As to the legal basis for divorce the law recognized only the so-called scriptural ground, adultery. Moreover the sex line was drawn, a double standard of morality being maintained. It was no doubt the excessive expenses of divorce proceedings that explains the very low divorce rate which has existed in England. Counting both separations and divorces the total has been less than one per cent. of all marriages, a rate found only in Austria, Canada, Italy, and Scotland. It is contended that a low divorce rate is no guarantee of high sexual morality; it is believed that easier divorce will even improve morals by greatly lessening bigamy and adultery; and it will have the very desirable result of terminating many unions that have proved intolerable. The objects therefore sought by the commission were an extension of the grounds for divorce, equalization of the legal privileges of the sexes, and a lessening of the expenses involved in divorce proceedings in order to bring legal relief within the reach of the poorer classes.

The report, submitted in November, revealed a division of opinion. The majority of the commission, nine in number, including the chairman, Lord Gorell, and the two women members, recommended extensive changes in the law designed to make divorce much easier. They would place the two sexes on a basis of legal equality as regards the grounds for divorce, these grounds to include adultery, desertion for at least three years, cruelty, incurable insanity after five years' confinement, habitual drunkenness found to be incurable after three years, and imprisonment under a commuted death sentence. They recommended that divorce cases be heard by a judge alone, that is, without jury, he being authorized also to close court and prohibit publication of details. They would increase facilities for hearing cases of poor people through the country, rather than in London alone, as at present. Moreover, they recommended that no report on divorce cases be allowed until the case is completed and that the publication of the portraits of the parties

involved be forbidden. It was the opinion of the majority that the evidence accumulated by their investigation showed that an extension of the grounds for divorce would raise rather than lower the standard of morality; and that the present difficulties, legal and financial, of securing a divorce produced considerable sexual immorality, especially among the poor. The minority report, signed by the Archbishop of York and two others, declared that only adultery constituted a sufficient ground for divorce. It did, however, favor equality of legal rights for both sexes. It favored local divorce courts, but not on the scale recommended in the majority report. Both majority and minority agreed in recommending that laws be enacted making possible the nullification of marriage in cases of unsound mind, of epilepsy and recurrent insanity, of venereal disease in communicable form, when a woman is in a condition that renders marriage a fraud upon the husband, or of willful refusal to perform the duties of marriage.

The line of division between the majority and minority as to the grounds for divorce was due to different attitudes toward the marriage contract. The minority took the position that marriage is sacramental in character and is essentially indissoluble, and therefore it recognized only that ground for divorce having New Testament sanction. The majority, however, proceeded on the assumption that marriage is a legal bond and that the state may rightly allow other grave causes than adultery for its dissolution. It held that the existing device of legal separation on grounds of cruelty, willful desertion, and drunkenness puts an end *de facto* to married life. Moreover, mere separation is unnatural, leads to evil consequences, and is inadequate in those cases where continued married life has become practically impossible.

It seems certain that, should the recommendations of the majority become law, the divorce rate in England and Wales would increase for a time.

DOBSON, AUSTIN. See LITERATURE, ENGLISH AND AMERICAN.

DOCKS AND HARBORS. The problem of providing proper pier facilities for the commerce of New York was agitated during the year and attracted the attention of municipal authorities and commercial bodies. The War Department, whose engineers are charged with the maintenance of the river channels, expressed its unwillingness to permit further encroachments on the fairway by the lengthening of existing piers, and was not disposed to give assurances that the present temporary extensions would be made permanent. The demands of commerce required piers over 1000 feet in length to accommodate such ships as the Hamburg-American line and the Cunard Company were building, while the proper and economic distribution of the commerce of the port also needed attention. It was proposed that the pier-head line from the Battery to Pier 30 should be straightened and accommodations be made for twenty piers from 950 to 1040 feet in length, and that in the future piers constructed above this point should extend to the pier-head line, and if greater length was re-

quired they should be excavated from the land. Various schemes were proposed for freight railways connecting the piers and for the development of the South Brooklyn wharves, but despite much valuable and constructive planning little of a positive nature was actually accomplished.

AMBROSE CHANNEL. To June 30, 1912, \$5,089,237.68 had been expended in building four dredges and excavating 61,586,873 cubic yards of sand, mud, and concrete from the Ambrose Channel, New York harbor, which at the end of the fiscal year was about 96 per cent. completed. This channel has a depth of 40 feet at mean low water, with widths of from 1850 to 2000 feet throughout its entire length, excepting a few shoal spots where soundings show occasional depths of between 39 and 40 feet. It is easily navigable at mean low tides for ships of 37 feet draught going at moderate speed, and has a maximum high water capacity of 44 feet. This channel was completely buoyed and lighted so that the largest vessels could enter it at all hours of the night, some steamers even making the passage in heavy fog. This channel had been restricted during its construction to the use of vessels of 29 feet draught or over, or of 600 feet length or over, but in 1909 regulations were issued permitting its use by day or night by all steamers not having tows, regardless of size. The necessity for some permanent restriction was suggested, owing to the fact that tows, sailing vessels, or craft not under complete control would interfere with the safe and legitimate use of the channel by the vessels for which it was intended primarily.

PORT OF BOSTON. In 1911 the Massachusetts State legislature passed a bill appropriating \$25,000,000 for the development of the port of Boston and a board of port directors was appointed. The first improvement was the remodeling of the commonwealth docks in the heart of the city at an expense of \$2,500,000, to accommodate the passenger service established by the Hamburg-American steamship line with Europe, which was to be put in operation early in 1913. It was also proposed to build a large dry dock capable of accommodating transatlantic steamers of great size, and developing the port according to a consistent scheme in which communication with the railways was to be an important feature. On December 24 an appropriation of \$3,000,000 was made for this purpose by the port directors, and a dry dock 1180 feet long, 175 feet wide, founded on a ledge of solid rock which is about 1300 feet in length and varies in width from 200 to 500 feet, will be built. This ledge previously has been a permanent obstacle in the way of desired pier extension, but will be particularly useful in connection with the new dry dock. This new dock will afford accommodations for the largest vessels, which the dredging of the channel and the construction of new piers make it possible to accommodate in the course of the improvement.

PORT OF LONDON. Work was begun during the year on the new dock adjoining the Victoria and Albert dock, which was the first portion of the extensive scheme of improvement to be taken up. The area of the dock was to be 65 acres, with a depth of 35 feet. The lock was to be 850 feet in length and 120 feet in width, with a depth of 45 feet over the sill

at high water. The amount of the contract was \$7,000,000. A graving, or dry dock, 1000 feet in length and 110 feet in width, was also a feature of this improvement. At Tilbury a contract was let for a jetty 1000 feet long and 50 feet in width, to be connected with the dock system of railways and equipped with the most modern type of cranes and appliances for handling cargo. This arrangement will afford two docks which together will cover an area of 50,000 square feet and will be used by vessels discharging part of their cargo either into barges or railway cars without entering the dock. Progress was made in dredging the channel of the Thames, and five large dredges with 21 steam hoppers of from 500 to 1000 cubic yards capacity and a suction dredger were at work, while a careful survey and examination of this work was being made by the engineering staff. The aim was to secure a 30-foot channel at low water as far as Albert dock.

LIVERPOOL. Work was in progress during the year on the great Gladstone dock, 1020 feet long, or 137 feet longer than the *Olympic*, with an entrance 120 feet in width and a depth of 35 feet of water at the lowest high-water tide. This dock was being built with a vestibule, or half-tide dock, of 14½ acres, which was to form access also to a second dock capable of accommodating vessels 1100 feet in length, construction of which was contemplated some time in the future. The entrance to this vestibule was to be 870 feet in length, with a sill 30 feet below old dock sill. To maintain a deep-water entrance from the sea, the Mersey requires continual dredging, and in 1912 some 18½ million tons of material were excavated. Various engineering works were in progress and in general the improvement of the port has been successful, the stone revetment on Taylor's Bank seeming to serve satisfactorily.

DOVER. The new sea wall, extending from the shore to the turret at the east end of the old Admiralty pier, and the reclamation of the foreshore between this wall and the existing pier, a length of 2300 feet, and 30 feet in width at its greatest part, was completed during the year. On the area thus reclaimed a new marine railway station will be built, with foundations of reinforced concrete piles driven through the newly deposited material to the solid chalk of the bed of the sea. The new station will afford accommodations for railway, custom house, and post office, and four lines of railway, with electric cranes for the speedy removal of baggage and freight to and from the railway cars and the boats. The Admiralty naval basin was found to be lacking in safety, owing to the strong currents that run through it and the great swell that is experienced in rough weather. This basin, which cost some \$17,000,000, requires extensive dredging on account of the sand and mud brought in by the tide.

THE HUMBER. The large Immingham dock of the Great Central Railway Company was opened during the year on the south side of the Humber, about six miles above its mouth. This dock was built to develop the export of coal from Derbyshire and Yorkshire and the mines in central England, and had an equipment of electric hoists capable of delivering into vessels 400 tons an hour. There was storage room for 100,000 tons of coal and 100 miles of siding. This dock also was designed for the

importation of timber and general merchandise and has a water area of $55\frac{1}{2}$ acres. The lock itself is 840 feet long, 90 feet wide, and 28 feet at low water on the sill and 48 feet at high water. A central pair of gates divide it into two compartments and there are two jetties at the entrance approach which extend 650 feet. One of these will be used for passengers and the other for coal vessels that do not require to enter the dock. A graving dock 750 feet in length, 56 feet wide, and 27 feet over the sill was built adjacent to the dock entrance. Other docks and piers were being constructed on the river, which was to receive improvement in the way of dredging.

ROSYTH. Less progress than was to be expected was made on the new naval dock and harbor in 1912.

BELGIUM. The improvement of the harbors along the coast was being actively undertaken by the Belgian Department of Public Works during the year, and new projects were determined on. At Zeebrugge the jetty was to be prolonged a distance of $1\frac{1}{2}$ miles towards Ostend by reinforced concrete construction. A dock for the use of steam trawlers was also being constructed at a cost of \$50,000, and at Blankenberghe various improvements were to be undertaken. At La Panne a new fishery port was to be built. To maintain the channels to the port of Ostend an annual appropriation of about \$400,000, apart from new works, is required.

ANTWERP. A commission to consider the improvement of the Scheldt, with special reference to the construction of a new cut six miles in length across a sharp bend in the river below the city, published its report early in 1912. The commission advises that the cut, known as the Grande Coupure scheme, be discarded and that the river channel should be rectified by reducing to normal and easy curves the more tortuous parts, and also by construction of a lock at Kruisschaus, which would afford access to a long channel 400 feet in width, after which a series of docks would be constructed. The estimated cost of this work was between \$8,000,000 and \$9,000,000.

UNITED STATES NAVAL DRY DOCKS. Dry dock No. 4, at New York, after various vicissitudes of construction since 1905, was finally completed and officially accepted during the year. The final contract provided for a dry dock with a length of 694 ft. 6 in. from coping at head to caisson when in outer gate seat, a width at elevation on top of keel blocks of 112 feet, and a depth over the sill at mean high water of 35 feet. In building this dock reinforced concrete carried on pneumatic caisson piers similar to those used for the foundations of high buildings was employed. This dock was able to accommodate the largest battleships in the United States navy or contemplated. Work also progressed during the year on the Puget Sound dock, which was to have a length of 827 ft. 6 in. and a width of 110 feet at the keel blocks, corresponding to that of the locks of the Panama Canal. It was virtually completed at the end of the year. Progress on the Pearl Harbor dry dock at Honolulu, under construction for the United States Navy Department, was delayed both on account of the changes in plan to accommodate vessels up to 1000 feet in length, the limit of the Panama Canal locks, and on account of the difficulty

in using the coral rock as a foundation for the structure. This coral work, which when mixed with the cement is the aggregate for the concrete and the walls, did not produce a mixture sufficiently strong. Hence a large amount of aggregate was required from the Pacific coast of the United States.

The size and distribution of docks was a matter that was intimately connected with the construction of large battleships. The docks under construction at Pearl Harbor, and the Puget Sound and the New York dock, while large enough to dock ships of 800 and 600 feet in length, respectively, were so far apart that the question of injuries to large battleships away from their immediate vicinity presented many difficulties; in fact, these three docks and the one at Norfolk were the only ones capable of accommodating the larger battleships in the United States navy, and two 1000-foot docks, one on the Atlantic and one on the Pacific coast, were recommended by the Secretary of the Navy in his report.

At the end of the year the Seattle Construction and Dry Dock Company was completing its new floating dry dock, with a lifting capacity of 12,000 tons. The new dock was 468 feet long, 110 feet wide over all, and 85 feet wide between towers. The dock was to be placed in a basin dredged to a depth of 50 feet at low tide, and affording ample facilities for the largest class of vessels entering port.

A new floating dock for the use of the British admiralty at Portsmouth was constructed during the year by Cammell, Laird & Co. of Birkenhead, and was successfully floated on August 14. The over-all dimensions of this dock are 650 feet in length and 144 feet in width, with a clear width at the top of the side towers of 113 feet. The side towers are 60 feet high from the bottom of the pontoon. The total displacement when submerged to take in a ship of 38 feet draught is 49,000 tons. This great dock was two years in building and has a capacity for vessels up to 32,000 tons. It has a complete equipment, including power plant, machine shops, traveling cranes, flying gangways, telephone, and other facilities. On September 3 in the Medway the first-class battleship *St. Vincent*, of 19,250 tons displacement, was successfully docked. On October 2 the large battle cruiser *Lion*, of 26,350 tons displacement, was successfully raised from a draught of 31 feet 6 inches.

A dock of almost similar construction was built for the Chatham Dock Yard, and one hardly smaller for the Vickers Canadian Works at Montreal. English makers also made a dock of 5100 tons capacity for Largos, one of 37,500 tons for Sourabaya, and a dock of 1500 tons capacity for the British admiralty for lifting submarines.

For municipal ownership of docks, see MUNICIPAL GOVERNMENT.

DOCK WORKERS' STRIKE. See STRIKES.

DOMINICA. A presidency of the Leeward Islands (q. v.). Most of the inhabitants are descendants of the original French settlers and speak a *patois*. Roseau, the capital, had (1911) 6577 inhabitants. The island is fertile; coffee, sugar, spices, oils, timber, fruits, etc., are exported.

Customs revenue (1910-11), £22,441; debt, £47,295. Administrator (1912), W. Douglas Young.

	1907-8	1908-9	1909-10	1910-11
Imports.	£121,650	£153,114	£128,779	£147,322

* Tonnage entered and cleared.

DOMINICAN REPUBLIC, or SANTO DOMINGO. An independent state occupying the eastern part of the island of Haiti. Capital, Santo Domingo.

AREA AND POPULATION. The estimated area is 18,756 square miles. The population, mostly of mixed Spanish and negro origin, is about 675,000, according to an official estimate published in 1912. For 1910 there are reported 3594 marriages, 28,235 births, and 6576 deaths. Principal towns: Santo Domingo, with about 20,000 inhabitants; Puerto Plata, 17,500; Macoris, 15,000; Santiago, 12,000. Public schools in 1910 numbered 526, with 18,812 pupils.

PRODUCTION AND COMMERCE. The leading crops include sugar, cacao, tobacco, coffee, and bananas. Statistics of production are not published. There is a considerable output of honey, and cattle-raising is important. Mining is not developed.

Imports and exports have been valued as follows:

	1908	1909	1910	1911
Imports ..	\$4,767,775	\$4,425,913	\$6,257,691	\$6,949,662
Exports ..	3,398,487	8,113,690	10,849,623	11,004,906

Leading imports, in thousands of dollars, in 1910 and 1911: Cotton manufactures, 1481 and 1617; rice and steel, 863 and 998; iron, 497 and 540; meat and dairy products, 416 and 415; wheat flour, 411 and 407; oils, 338 and 321. Principal exports: Raw sugar, 5591 and 4160; cacao, 2850 and 3902; leaf tobacco, 958 and 1421; coffee, 324 and 319; bananas, 289 and 195; beeswax, 149 and 165; cattle hides, 124 and 104; drug and dye materials, 81 and 102. Trade with principal countries, in thousands of dollars:

	Imports		Exports	
	1910	1911	1910	1911
United States.....	3,739	4,120	7,661	5,761
Germany	1,087	1,266	2,094	2,947
United Kingdom	715	776	142	764
France	210	213	724	1,081
Spain	123	152
Italy	102	139	22	9
Other	202	282	206	445
Total	6,258	6,950	10,850	11,005

Entered at the ports in the foreign trade in 1911, 607 vessels, of 478,796 tons (333, of 446-, 151 steam), and cleared 573, of 420,746 (315, of 396,740 steam). Merchant marine, 11 sailing vessels, of 1541 tons.

COMMUNICATIONS. Puerto Plata is connected by rail with Santiago and Moca, and Sánchez with La Vega; a branch connects Macoris with Jina, and Salcedo with Cabullas. Length of railways, 282 kms. (175 miles); in addition, private lines for the larger sugar plantations, 362 kms. (225 miles). A line is projected to connect Santo Domingo with Cibao, 129 kms. (80 miles). Telegraphs, about 2300 kms., with over 50 offices. Post offices, 81.

FINANCE. Revenue and expenditure in 1910,

\$4,705,738 and \$4,645,287. Customs receipts in 1910, \$3,203,427; in 1911, \$3,485,687. Of the latter amount, \$3,162,729 was import duties, \$225,455 export duties, and \$97,502 fees, fines, etc. A treaty between the Dominican Republic and the United States authorized a loan of \$20,000,000 for the conversion of the debt and established an American receivership of customs, from April 1, 1905. Obligations are met promptly.

GOVERNMENT. The president is elected by indirect vote for six years and is assisted by a cabinet of seven members. The legislative body consists of the Senate (12 members) and the Chamber of Deputies (24). Gen. Ramón Cáceres was installed in 1906 to complete his predecessor's term and was inaugurated for a full term July 1, 1908. He was shot and killed by an assassin November 19, 1911. On December 2 Eladio Victoria, a senator, was elected provisional president by the congress, and president February 2, 1912. He was inaugurated February 28. Political unrest was soon apparent. The new president was charged with being little more than the tool of the ambitious and aggressive minister of war, his nephew, Alfredo M. Victoria. Revolutionary outbreaks ensued, and late in November President Victoria resigned. The revolutionists demanded that Archbishop Adolfo Alejandro Nouel serve as provisional president until the constitution could be revised and general elections held. Accordingly, the archbishop was elected December 2, for two years, and early in the month he assumed the executive duties in the hope of restoring peace. See UNITED STATES, *Foreign Relations*.

DONNET-LEVEQUE. See NAVAL PROGRESS, *Aviation*.

DOVER, PORT OF. See DOCKS AND HARBORS.

DRAINAGE. UNITED STATES. The increasing activity in the development of land by drainage has continued through the year 1912, the greatest activity being in the South Atlantic States and the lower Mississippi Valley. The work is ordinarily done by drainage districts formed under the general laws of the States, sometimes by special legislative acts. Almost the entire area of wet lands has passed into private ownership, and that to which the United States still holds title is virtually held in trust for the States. The Federal government lends no financial aid in drainage work, save in the control of the Mississippi river and some of its main tributaries. The United States Department of Agriculture has a force of engineers investigating technical drainage problems, and frequently gives advisory assistance with respect to certain projects, occasionally conducting surveys and preparing the plans. The cost of the improvements is assessed against the land, generally in proportion to the benefits to be received.

Plans have been made for draining a number of districts in the Coastal Plain of Virginia, North and South Carolina, and Georgia, and the excavation of ditches has begun for several large districts on the borders of the Dismal Swamp and between Albemarle and Pamlico sounds. The largest single swamp area is the Everglades of Florida, sloping uniformly southward from Lake Okeechobee. The State is digging five canals intended to lower the level of the lake and prevent it from overflowing, which

is one source of the inundation of that vast prairie. Along the Gulf Coast of Louisiana are more than 10,000 sq. m. of lands too low for gravity drainage. These are being reclaimed by individual enterprise, in tracts of several thousand acres. Dikes are built entirely surrounding each tract, a network of ditches is excavated, and machinery is installed to pump the seepage and rain water over the embankment. In Texas, a drainage survey has been completed of all Jefferson County, approximately 700,000 acres, and indications are that similar work will be done by adjacent counties. Construction work is in progress for two districts embracing several hundred thousand acres in southwest Missouri and northeast Arkansas, and plans have been completed for other large districts in Arkansas and Mississippi. In the spring of 1912 occurred the most severe flood that has been recorded for the Mississippi river, below the Ohio. The levees broke in several places, and some 8350 sq. m. were overflowed. However, had the levees been completed to the full height and cross-section planned (the work has progressed continuously), it is probable that the flood would have been confined between the embankments and there would have been no considerable loss of life and property. See **MISSISSIPPI FLOODS**.

The extension of the use of tile drains to improve the productiveness of farm lands already under cultivation, continues unabated. The greatest activity in this line is in Illinois, Indiana, Iowa, Minnesota, and Wisconsin. Underdrainage is quite rapidly coming to be practiced in New York, Maryland, and Kentucky, and to a less extent in Kansas, Mississippi, Alabama, Georgia, the Carolinas, and Virginia. The continued irrigation of lands in the arid region has developed the need for artificial drainage there. Natural drainage being deficient, the water applied in excess of that used by the vegetation and that directly evaporated, accumulates in the depressions of a relatively impervious substratum until the plane of saturation rises to the lower points of the ground surface, or it flows along upon the substratum until it reaches the surface at a lower elevation. To prevent the resultant swampy condition, deep drains are usually efficient to intercept the underflow; sometimes with wells down to a waterbearing stratum deeper than it is economical to place the drains.

EGYPT. Work was begun in 1912 on the project to drain 950,000 feddans (978,500 acres) in the delta of Lower Egypt, at a cost estimated at \$12,500,000. The work is being done by the Egyptian government, which owns 90 per cent. of the land, and will be completed in four years. The project comprises two separate drainage systems, some miles apart, which will be built coincidentally. The West Behera system will drain 480,000 feddans, including Lake Mariout. About two-thirds of the whole area is classed as cultivated, but none is highly productive. The lake covers 35,000 feddans, is 1 meter deep, and its surface is 3 meters below sea level. The drainage pumps will hold the ground water about 5.6 meters below sea level. The Gharbid system will drain 470,000 feddans, half of which now produces rice; the balance yields nothing. The drainage water will be pumped into Lake Borollos. In both systems the ditches will be 6 meters deep, and the water will be maintained 5 feet below

the land surface. No plot of ground will be more than $1\frac{1}{4}$ miles from a drain owned and maintained by the government. This project, in importance to Egypt, is second only to the Assuan Dam. Egypt's prosperity is almost entirely dependent upon the cotton crop, and it is estimated that upon the completion of this drainage project the cotton yield will be increased 50 per cent. over that for 1911. Moreover, cotton is raised only every second year, alternating with wheat or maize, so it is probable Egypt will soon produce enough cereals for her needs instead of importing 200,000 tons of wheat yearly, as now. As an experiment, about 600 feddans of the drained land have been given in 5-feddan lots to landless peasants. For 3 years the holders will have the land practically free, doing reclamation work; during the next 10 years they will pay a moderate rental; then they will have title to the land for life, and it will descend in the family if the government approves. See **DAMS**.

OTHER COUNTRIES. In India there has begun the dredging of the Jhelum River between Sopar and the Baramulla rapids, using hydroelectric power developed for the railway projected to be built into the Kashmir Valley. The surface of Woollar Lake is to be lowered 10 feet, thereby reclaiming 55,000 acres of swamp land and reducing the severity of floods at Srinagar. Dipper dredges removing the packed boulders forming the bed of the rapids have met with difficulty and work there is held in abeyance, but suction dredges are working in the channel above the rapids. Authoritative opinion holds there is no danger of reducing the winter supply of water for the irrigation canals now under construction, which would seriously affect the great wheat-growing districts of the Punjab. Russia plans to reclaim by pumping 378 acres on the Caspian Sea near Baku, for drilling oil wells. This land has been sold for \$5700 per acre. If this is successful, 700 acres more will be similarly reclaimed. In Cuba, 200 square leagues known as Cienega de Zapata have been granted to a company, with the obligation to sanitize and reclaim the land in 8 years. Activity in drainage continues in Norway, Germany, and the Netherlands, and is developing in Algeria, China, and Australia.

DRAMA. The theatre season of 1912, in both America and England, was made notable mainly by two movements which were diametrically opposed to each other in purpose and in method. One of these movements was romantic and the other realistic.

The romantic movement expressed itself in several plays which were localized in the fabulous and eye-enchanting East. The appearance of these plays cannot be taken as an evidence of any active interest in the actual life of the Orient; it was an evidence, rather, of a desire to escape the tyranny of fact by seeking the unusual and the remote. These plays laid their emphasis on plot instead of character, and told their stories mainly to the eye. The first of these pieces to captivate both London and New York was *Kismet*, by Edward Knoblauch. It was a picturesque romance set in the fabled Bagdad of one thousand and one years ago, and dealt with the multifarious adventures of the beggar Hajj upon his day of days. Action was the dominant note of this hurrying and many-mooded narrative; there was never any

lull in the luxuriance of incident; and the story was illustrated by a sumptuous investiture of scenic decoration which delighted the eye and drenched the mind with all the glamour of the gorgeous East. But even more artistic was the pantomime called *Sumurun*, which was produced by Max Reinhardt of Berlin and imported successively to London and New York. *Kismet* was pictorial in its appeal, but *Sumurun* carried still further the conception of the modern drama as an art that is mainly visual instead of auditory, for it was imagined as a bit of decoration. Divested of dialogue, the Reinhardt pantomime could not attempt to set forth a "criticism of life," instead, it exhibited to the eye a continuously seductive pattern of lines and colors, forms and shadows, while the ear was allured by incidental music. The scenery was very simple: the backgrounds were devoid of perspective lines and were rendered in monochrome, so that they stopped the eye and flung into vivid relief the costumes of the actors. The pantomime told a savage story reminiscent of the *Arabian Nights*.

Later in the year, the locus of the romantic drama was moved still further eastward, from Arabia to China. An ancient Chinese drama entitled *The Flower of the Palace of Han*, which was written between 1260 and 1368 A. D., by Ma Tchen-Yuen, was presented in New York, and proved mildly interesting as a curiosity. The Century Theatre production of *The Daughter of Heaven*, a panoramic play of modern China, by Pierre Loti and Judith Gautier, adapted into English by George Egerton, was a disappointment as a work of art and must be noted as the most colossal failure of the year. The piece was not at all dramatic, and, in the English version was lacking even in literary merit. It was lavishly produced, but the sumptuous scenery served more as an incumbrance to the story than as an illustration of it. Finer, from the artistic standpoint, was *The Yellow Jacket*, by J. Harry Benrimo and George C. Hazleton, Jr. This was an imaginary Chinese play acted in accordance with the traditional conventions of the Chinese theatre. Considerable humor was evoked by a tactful exhibition of the crudities of the Chinese method of handling the stage, which is almost identical with the method of our own Elizabethan dramatists; and the piece itself was charmingly poetic. As an æsthetic adventure, *The Yellow Jacket* was one of the very finest achievements of the year.

Closely related to these fantastic Oriental dramas were two other plays which emphasized the contrast at the present day between the life of the Orient and the life of the Occident. *The Bird of Paradise*, by Richard Walton Tully, was set in the Hawaiian Islands. A drunken beach-comber was dragged upward to civilization by marrying an American girl, and a promising young American physician was dragged downward to savagery by marrying a native princess. *The Typhoon*, a melodrama of the Sardou type, written by a Hungarian playwright, Menyhert Lengyel, was adapted into English by Emil Nyitray and Byron Ongley. A Japanese student in Berlin, who is engaged upon a secret mission for his country, kills a German woman, who has been his mistress. In order that the hero may fulfill his mission, his fellow-countrymen in Berlin depute another and less important member of the student colony to

assume the guilt of the murder and take the consequences.

The other notable dramatic movement of the year was, as has been stated, a realistic movement. It expressed itself emphatically in a very remarkable group of British plays, nearly all of which were written by authors formerly unknown. These plays were sedulously localized in actuality. The authors laid their emphasis on character instead of plot; and, eschewing the adventitious aid of pictorial appeal, they addressed their message to the ear, through the literary medium of dialogue. The greatest of these plays was *The Pigeon*, by John Galsworthy. It offered a sympathetic exhibition of the social status of the despised and rejected of this world and discussed the delicate problem of organized charity. Like all of this author's dramas, *The Pigeon* was deliberately inconclusive; it asked questions, but forbore to answer them. In *The New Sin*, by Basil MacDonald Hastings, the hero is so situated that he can accomplish nothing by continuing to live, but can confer a material benefit upon a dozen of his fellow beings by merely ceasing to exist; and the play propounds a tensely interesting struggle between his theoretical right to live and his practical duty to die. *Hindle Wakes*, which was written in the Lancashire dialect by Stanley Houghton, exhibits the effect on several selected characters of a single incident that is assumed to have happened before the play begins. A working girl and the son of her employer have gone away together over the mid-August holidays. Their escapade is discovered by their parents, and by the young man's fiancée and her father. These people force the young man to agree to marry the girl whom he has wronged; but in the final scene the girl refuses him, on the ground that she does not love him, and that she herself is just as responsible as he for what has happened. *Rutherford & Son*, by Githa Lowerby, is a sturdy exhibition of the power of one man of extraordinary strength and narrowness of mind to crush the life-spirit out of every one who comes in contact with him. This uneventful but impressive drama is set in the living-room of a Northumbrian family; and the dialogue is written in the North Country dialect. Somewhat analogous to these plays is *A Scrape o' the Pen*, a scarcely successful attempt by Graham Moffat to repeat the impression that he made the year before with *Bunty Pulls the Strings*.

Of plays contributed during the year by the acknowledged leaders of the British drama, the palm must be accorded to *Fanny's First Play*, by George Bernard Shaw. This brilliantly witty composition illustrates the theme that the so-called "principles" of ordinary people are merely habits of the mind and will be powerless to aid them to cope with a novel situation. The play itself is enclosed within a prologue and an epilogue in which the author satirizes four of the best-known dramatic critics of London. Two plays by Sir Arthur Pinero were produced in 1912; but neither of them approached the lofty standard which has been set by this playwright in the past. *Preserving Mr. Panmure* was remarkable mainly for the technical skill with which the author toyed with a theme that in itself was trivial. *The Mind-the-Paint Girl* was a more important composition. It discussed the advantages and

disadvantages of those marriages which have frequently occurred in recent years between London show-girls and young scions of the peerage. It was designed as a *genre* study of the conditions of life in and about a typical musical-comedy theatre. It was admirably written; but only one of its four acts attained the tensify of drama. *Lady Patricia*, by Rudolf Besier, was also a little disappointing. It was a fanciful satire of pre-Raphaelite affectation. The dialogue was written with literary skill; but the drama was too thin in substance and too symmetrical in structure. Alfred Sutro contributed *The Perplexed Husband*, an entertaining satire of the woman-suffrage movement. *Milestones*, which was written by Arnold Bennett in collaboration with Edward Knoblauch, was one of the most successful plays of the London season and was only a little less successful in New York. It owed its popularity to its unique idea. All three acts were set in the same room; but the first act was dated 1860, the second 1885, and the third 1912. The story followed the fortunes of two families through three successive generations, and showed how in every generation there had been a struggle between the radicalism of youth and the conservatism of age.

Of continental playwrights who were represented on the New York stage in 1912 the most important were August Strindberg, Maurice Donnay, Edmond Rostand, Henry Bernstein, and Arthur Schnitzler. Mme. Simone produced, in English, *The Return from Jerusalem* of Donnay and *The Lady of Dreams* (*La Princesse Lointaine*) of Rostand, both of which had been noted for many years in France. Strindberg's *The Father* was the first of his plays to be produced professionally in America, and it created a profound impression, in spite of the morbid horror of its study of incipient insanity. *The Attack* (*L'Assaut*) of Bernstein was constructed in accordance with his usual formula and was replete with moments of suspense and of surprise; but the material was less vital than that of his previous plays. Schnitzler's clever series of dialogues entitled *Anatol* may be recorded as the season's portion of "caviare to the general."

Turning to plays of American authorship, it must be noted that very little work of genuine importance was accomplished in 1912 by the recognized American playwrights. The best American play of the year was *Kindling*, by a new author named Charles Kenyon. This was a profoundly sincere and sympathetic study of the emotions of the desperate poor, and was significant, not merely as a play, but also as a social document. The heroine was a poor woman condemned to live in an insanitary tenement who stole a hundred dollars in order to escape to a homestead in Wyoming so that her unborn child might have a better chance to live. The play experienced a commercial failure when it was presented in New York; but it was immediately resurrected by a disinterested group of authors who had been impressed by its merits, and was subsequently played for over forty weeks upon the road. Augustus Thomas, the acknowledged leader of the American dramatists, produced two disappointing pieces during the course of the year. These were entitled *The Model* and *Mere Man*. Both of them suffered from the fact that the author discussed too many unrelated themes during

the course of the dialogue. *The Talker*, by Marion Fairfax, exhibited the harm that may be wrought by so-called "advanced" ideas upon the minds of idle women who are lacking in culture. A. E. Thomas contributed an ingratiating sentimental comedy called *The Rainbow*, which told very prettily the story of a father's love for his seventeen-year-old daughter, from whom he had been separated since her babyhood. A *Rich Man's Son*, by James Forbes, was less humorous and human than his former efforts. Edward Sheldon, however, showed an advance in *The High Road*, which exhibited for the first time an endeavor to look at life in the large and to draw a complete portrait of a character; but the piece, though admirable in material, was straggling in structure. George M. Cohan came forward with a brisk comedy entitled *Broadway Jones*, wherein a young man whose character has been all but ruined by the fast life of New York is made an estimable citizen by the simple process of settling down in the little country town where he was born. The Cohan touch was also evident in the American revision of *Hawthorne of the U. S. A.*, a romantic farce originally written by the London playwright, James Bernard Fagan. In this piece a young American adventurer averts a revolution in the Balkans by buying off the insurgent soldiers with money he has won at Monte Carlo, and ultimately marries the princess of the little state that he has saved.

Among the American farces of the year may be mentioned *Ready Money*, by James Montgomery, *Officer 666* by Augustin MacHugh, *Never Say Die*, by William Collier and W. H. Post, and *Stop Thief*, by Carlyle Moore. The first two were transferred successfully from New York to London. Of these the best is *Ready Money*. The theme of this piece is that anyone may easily make money if people think that he already has it; and the hero, who is utterly without resources, successfully floats a mining venture by the expedient of flashing a roll of counterfeit bank notes before the eyes of prospective investors.

The most exciting melodrama of the season was *Within the Law*, by Bayard Veiller. A shopgirl who has been wrongfully convicted of robbery and sent to jail, resolves after her release to be revenged on her prosecutors. She organizes a gang of criminals and cleverly handles them so that their depredations are kept always within the letter of the law. The drama deals with the efforts of the police to undermine her campaign by tempting one of her gang to an overt violation of the statutes. This piece was deficient in characterization, but it was admirably plotted. Its overwhelming success soon led to the production of several other melodramas dealing with criminals and detectives and police. Of these the most interesting were *The Argyll Case* by Harriet Ford and Harvey J. O'Higgins, and *The Conspiracy*, by John Emerson and Robert Baker.

David Belasco made three productions during the course of the year. Once again he demonstrated his superlative ability to lend an air of verisimilitude to compositions which in themselves were artificial. *The Governor's Lady*, by Alice Bradley, told a sentimental story of an ambitious man who put aside his faithful wife of many years in order that he might be free to marry a younger woman who

could help him in his climbing. In the last act the man and his wife met by accident in a Childs restaurant and were reconciled. The act was utterly untrue to nature, but it, allowed Mr. Belasco an opportunity to set a restaurant upon the stage. *The Case of Becky*, by Edward Locke, was a melodrama built upon the theme of dual personality. The heroine, who was normally a charming girl, suffered frequently from lapses to a secondary personality,—that of an impish hoyden,—but was eventually cured by means of hypnotism. *Years of Discretion*, by Frederic Hatton and Fanny Locke Hatton, was a conventional comedy that was lifted into life by exquisite acting and careful stage direction.

Several new theatres were opened in New York during the course of the year, but the only one that need be noted as inaugurating a new policy is The Little Theatre, which was erected by Mr. Winthrop Ames. This house seats only 299 people, and it is the policy of the manager to offer intimate productions of unusual works of art for the benefit of the tasteful few. The edifice itself is a gem of architecture and is easily the most beautiful playhouse in America. To Mr. Ames belongs the credit of having produced at this theatre such admirable works as *The Pigeon* and *Rutherford & Son*. He was also the first manager to put into practice the idea of a children's theatre, by offering at daily matinées a dramatization of *Snow White and the Seven Dwarfs*, the famous fairy tale of the Brothers Grimm. Shortly afterward, George C. Tyler erected a cozy theatre for children on the roof of the Century Theatre, and followed Mr. Ames' policy of giving daily matinées. His first production was a little play by Mrs. Frances Hodgson Burnett entitled *Racketty-Packetty House*. Both of these pieces were enthusiastically welcomed; and the idea of a children's theatre seems at last to have become an established fact. DUFFIELD, HENRY MARTYN. American soldier and lawyer, died July 13, 1912. He was born in Detroit, Mich., in 1842, and graduated from Williams College in 1861. He enlisted as a private in the 9th Michigan Infantry in the same year and rose through the ranks of service until he became assistant and acting provost marshal-general of the Army of the Cumberland. In 1865 he was admitted to the bar and practiced law in Detroit. From 1881 to 1887 he was city counsellor of that city. He was appointed brigadier-general of volunteers in 1898 in the Spanish-American War. In 1903 he served as umpire of the German-Venezuelan Arbitration Commission. He was prominent in American politics and attended every national convention from 1876. He was a member of several military societies.

DULUTH. See MUNICIPAL GOVERNMENT, *Commission Plan*.

DULUTH COMMISSION PLAN. See MUNICIPAL GOVERNMENT.

DUNBAR, RALPH O. American jurist, died September 19, 1912. He was born in Schuyler

county, Ill., in 1845. He removed with his parents to Oregon when he was one year of age. He was educated at Willamette University and in 1867 removed to Olympia, Wash. In 1869 he was admitted to the bar. He practiced at Yakima City for several years and then removed to Goldendale. In 1879 he was elected a member of the Territorial legislature and in 1885 was speaker of that body. He was appointed associate justice of the supreme court of the State in 1889 for the term expiring 1913.

DUNCAN, JOSEPH WILSON. An American soldier, died May 14, 1912. He was born in a tent in an army camp on the bank of the Nueces River, Texas, in 1853. He was educated in the public schools of Nashville, Tenn., and Columbian College (now George Washington University). He served for a time as an engineer of the geological survey of the Yellowstone, and in 1873 was appointed second lieutenant of the 21st Infantry. He went through the various stages of promotion until he became colonel in 1903. His services include participation in the Indian wars in 1877-78, and 1890-91. In the Spanish-American War he took part in the battle of San Juan Hill and in the siege of Santiago de Cuba. He served in the Philippines in 1899-1902 and in 1905-6. In 1906 he commanded the forces engaged in the so-called battle of the Lava Cone, in which he practically annihilated a body of rebellious Moros, after a severe fight in which over 100 Americans were killed. General Duncan was severely criticised because the women of the Moros were killed in the assault made by the American soldiers. It was claimed, however, that the women fought so viciously that they had to be treated as the men were. From 1907-11 General Duncan was a member of the general staff when he was sent to Texas to prevent filibustering along the Mexican border. He was several times brevetted for gallantry in action and was promoted to be brigadier-general for his services in the Philippines.

DUNCAN, WILLIAM BUTLER. An American capitalist, died June 20, 1912. He was born in Edinburgh, Scotland, in 1830, and while he was still a youth accompanied his father to the United States. The latter engaged in banking business in New York City. Mr. Duncan graduated from Brown University in 1860 and at once entered the business of banking. In 1865 he became head of the banking firm of Duncan, Sherman & Co., of New York City. Turning his attention to railroads he was from 1874 to 1878 president of the Mobile and Ohio Railroad Company. He was also connected at various times with important financial interests as officer and director, and he became one of the leading figures in the financial and social life of New York City. His collection of rare editions of books and autograph copies was a notable one. He was vice-president of the New York Chamber of Commerce and president of the Pilgrims of the United States, and of The Pilgrim Society of America. He was a member of the National Academy of Design, the Metropolitan Museum of Art, and the American Museum of Natural History.

DUTCH EAST INDIES. The colonial possessions of the Netherlands, lying between Australia and the Asiatic continent. Capital, Batavia.

AREA AND POPULATION. The Dutch East Indies consist of two main divisions: (1) Java

(16 residencies) and Madoera (1 residency); and (2) the outposts (17 provinces). Area and population (for the outposts approximate) of Java, Madoera, and the outpost provinces at end of 1905:

	Sq. m.	Pop.
Java	48,686	28,604,719
Madoera	2,090	1,493,289
Outposts		
Island of Sumatra:		
Sumatra, West Coast.....	31,788
Padang Highlands.....		403,431
Padang Lowlands.....		905,040
Tapaoell		413,301
Benkoelen	9,437	204,269
Lampung Districts.....	11,338	156,518
Palembang	53,718	796,352
Sumatra, East Coast.....	35,481	568,417
Atjeh	20,550	582,175
Riouw*	16,379	112,216
Banka	4,473	115,189
Billiton	1,869	36,858
Borneo, West District.....	56,061	450,929
Borneo, South and East Dist.....	157,587	782,726
Island of Celebes†:		
Celebes	49,600	415,499
Menado	22,177	436,476
Ambolna†	19,870	299,004
Ternate†	176,598	370,902
Timor	17,782	308,600
Ball and Lombok.....	4,063	523,535
Total	739,559	37,979,377

* Consists of Indragiri in Sumatra and the Riouw and Lingga archipelagoes. † Included in Ternate are a part of eastern Celebes island, Dutch New Guinea, and a part of the Moluccas; the rest of the Moluccas are in Ambolna. Dutch New Guinea extends to 141° E. with estimated area 152,428 square miles and estimated population 262,000.

The native population (exclusive of New Guinea) numbered 37,020,460 (Java and Madoera, 29,715,908); Europeans, 80,910; Chinese, 563,449; Arabs, 29,588; Orientals other than natives, 22,070. Batavia had 138,551 inhabitants; Semarang, 96,600; Pehalongan, 41,719; Djok-jakarta, 118,378; Padang, 91,440; Palembang, 60,985; Bandjermasin, 16,708.

COMMERCE. Government and private trade, merchandise and specie, are given for three years (in florins):

	1908	1909	1910
Imports			
Government:			
Merchandise...	7,667,549	6,718,507	13,014,463
Specie	8,850,000	5,500,000	2,640,000
Private:			
Merchandise..	243,544,983	260,287,611	315,331,656
Specie	20,499,027	9,130,140	17,308,683
Total	280,561,559	281,636,258	345,294,802

Total	470,714,604	455,094,194	452,597,831

Of the trade other than government in 1910, 233,743,330 florins imports (219,493,063 mdse., 14,250,267 specie) and 259,452,610 florins exports (259,009,535 mdse., 443,075 specie) are attributable to Java and Madoera. Principal exports follow, quantities in metric tons (figures in parenthesis represent the export from Java and Madoera): Coffee from government plantations 1096 tons (1096), from private estates 14,735 (9800); sugar, 1,317,049 (1,316,

946); rice, 61,822 (52,032); arrack, 3,554,000 liters (3,553,000); rattans, 44,190 (422); black pepper, 21,495 (9584); skins, 7932 (5744); tobacco, 61,236 (38,012); indigo, 54 (54); nutmegs, 2580 (317); dammar, 9808 (1984); kapok (Java cotton), 9186 (8377); tea, 15,337 (15,337); copra, 248,148 (107,992); tin from government mines, 15,678 (14,214); other tin, 2343 (2278); cinchona, 7235 (7119) from private and 564 (564) from government plantations. Merchant marine (1910), 12,669 vessels, of 621,292 cubic meters capacity (11,785, of 292,579, native craft). Vessels entered (1910), 6582, of 11,907,000 cubic meters capacity. Railways in operation (1910), 2553 kilometers (Java and Madoera, 2230; Sumatra, 323). A government line (152 miles) connects the port of Padang with Fort de Kock and has three short branches. The Deli Railway is a private line on the northeast coast in the tobacco-growing district and radiates in several directions from Medan (about 80 miles).

PRODUCTION. Area (1910) under rice, 3,274,264 bahoes (1 baho=1½ acres), production, 84,286,647 piculs; sugar cane, 213,856 (sugar production, 20,459,495 piculs); tobacco, 213,532; indigo, 17,940; other cultures, 3,213,941. Government coffee plantations (Java), 72,192 bahoes (production, 32,067 piculs); production from emphyteutic lands, 172,336; from private estates, 13,818; native culture (total Dutch East Indies), 79,914 piculs. Tobacco: 830,568 kilos from government plantations, 8,064,555 from emphyteutic plantations, and 436,409 from private estates. Tea (Java), 15,055,083 kilos; indigo (1906), 289,527 kilos; cacao (1910), 1,180,849.

Tin from the government mines at Banka in 1910-11, 270,170 piculs; from private mines (as Billiton and Riouw), 73,110. Coal production (1910), 542,947 metric tons; petroleum, 1,491,382 tons. Gold, silver, diamonds, copper, and manganese are mined.

FINANCE, ETC. Estimated revenue (1910), 220,834,112 florins (actual 1909, 197,237,032); expenditure, 226,894,203 (201,278,893). Budget, 1911: 228,738,000 florins; 1912, 265,862,000. A. W. F. Idenburg was governor-general in 1912.

ARMY. The colonial force maintained by voluntary recruitment has an effective strength of 36,861 officers and men, of which 12,841 are Europeans. Auxiliary troops are supplied by the feudatory chiefs and a territorial militia of little value is maintained. Plans have been adopted for the mobilization of this force for war purposes.

DUTCH EXPOSITION. See EXPOSITIONS, Holland.

DUTCH GUIANA, or SURINAM. A colony of the Netherlands (between 46,000 and 49,000 square miles) on the northern coast of South America. Population (1910): 913 Europeans, 7894 Dutch East Indians, 19,683 British East Indians, 52,369 indigenous, 3643 other; total (exclusive of negroes in interior forests), 86,233. Of these, 36,480 are classed as without occupation. Immigrants employed under contract on plantations December 31, 1910, 11,561. Sugar production (1910) 12,015,100 kilos; molasses, 164,100 liters; rum, 797,800 liters; cacao, 1,683,000 kilos; coffee, 202,300; corn, 1,323,000; rice, 1,993,700; bananas, 202,300 bunches. Gold yield 1,081,476 grams, valued at 1,481,622 guilders (or florins); gold export,

1,446,073 guilders. Total imports (1910), 424,698 gl.; exports, 8,345,447. Tonnage entered, 210,998; cleared, 213,391. Revenue and expenditure (provisional) in 1911, 6,489,000 and 7,308,000 guilders, respectively; subvention, 818,000. R. D. Fock, governor in 1912.

DUTCH WEST INDIES. See CUBAÇAO and DUTCH GUIANA.

DYKES, JAMES OSWALD. A Scotch theologian and educator, died January 1, 1912. He was born in Port Glasgow, Scotland, in 1835, and was educated at Edinburgh University and New College. He also studied at Heidelberg and Erlangen. In 1859 he was ordained and became an assistant at St. George's Church, Edinburgh, 1861. Three years later he resigned on account of ill health and spent three years in Melbourne, Australia. From 1869 to 1888 he was minister of the Regent Square Church, London. Under his ministry this church became one of the leading non-conformist churches in London. In 1888 Dr. Dykes was chosen principal of the Presbyterian College and at the same time became Barbour Professor of Divinity in that institution. This position he retained until 1907 when he resigned and became principal emeritus. He was the author of *Beatitudes of the Kingdom* (1872); *Laws of the Kingdom* (1873); *From Jerusalem to Antioch* (1874); *Law of the Ten Words* (1884); *The Gospel According to St. Paul* (1888); *The Christian Minister and His Duties* (1908), and *The Divine Worker in Creation and Providence* (1909).

DYNAMIC GEOLOGY. See GEOLOGY.

DYNAMITERS, TRIAL OF. See TRADE UNIONS.

DYNAMO-ELECTRIC MACHINERY. In the field of electric generators the developments of 1912, as in 1911, tended toward larger sizes and higher speeds rather than distinct new types. Steam turbine-alternators reached the enormous capacity of 25,000 kilowatts, equivalent to 33,500 horsepower, in striking contrast to the units of 100 kilowatts which were installed in the first generating station in New York just thirty years previous, and which were at that time known as the "Jumbo" type because of their great capacity. In 1912 alternators of 20,000 kilowatts were built for operation at 1800 revolutions per minute, and machines of 5000 kilowatts for 3600 revolutions per minute. In these developments America has led Europe, the 20,000 kilowatt unit appearing there for the first time in 1912. In the realm of water-wheel generators a similar development in capacity has occurred, reaching a maximum of 17,000 kilowatts. The difficulties in designing large direct-current generators for steam-turbine drive were partially overcome. Direct-connected units of 1500 kilowatts and 600 volts and geared units of 1000 kilowatts were produced. The demand for automobile-lighting generators capable of giving constant voltage at variable speeds greatly stimulated inventive activity in this line. One unique type is a shunt generator having the armature and brush gear mounted on a sleeve which winds along the shaft against a spring, varying the surface of the armature which is active according to the speed, so that a constant voltage is maintained over a speed range from 800 to 3800 revolutions per minute. Ingenious work was done in developing electrical devices which may serve as generators for automobile lighting and

ignition, and as motors for self-starting in conjunction with a storage battery.

Important progress continued in rectifying and converting apparatus. Synchronous converters of 7500 kilowatts with a maximum capacity of 10,000 kilowatts were put in operation. The high-power mercury-arc rectifier operating in a steel tube entered the commercial field in Germany, but remained in the development stage in America. A very ingenious device was brought out by a Swiss company which compensates for the poor power factor of induction motors. It consists of a phase advancer or small rotary armature, to which current is supplied through a commutator. A stationary field is created, which reacts on the windings to create a current leading to that of the source from which the armature is magnetized by 90° in phase. This current feeds back into the induction motor to which the device is attached and corrects its power factor very successfully.

EARTHQUAKES. The record of earthquakes for the past year was not specially notable in regard to numbers or magnitude of the disturbances. Fewer disasters attended their occurrence than usual, at least as compared with the formidable list that marked the period from 1906 to 1910, beginning with the San Francisco shock. The seismograph stations, of which a number have been established in different parts of the country, registered many disturbances from more or less distant sources. These were centred chiefly in northern Alaska, in the Cordilleran region of Mexico and South America, and in the eastern Mediterranean region. Some of the more prominent ones are here noted: A severe shock occurred on January 31 in the vicinity of Prince William Sound; reports from Valdez described it as the heaviest ever felt in that place. It continued for about one minute and was followed by nine minor tremors. The glaciers on the nearby mountains sent forth tremendous reverberating noises from avalanches along their courses. A prolonged but not damaging earthquake was felt on May 14 in the West Indies, notably at Antigua, St. Kitts, and Guadeloupe. The principal shock of the year noticeable within the limits of the United States took place June 12 in South Carolina and Georgia. The cities of Columbia, Augusta, and Savannah appear to have experienced its full effects, which were sufficient to cause the houses to rock slightly and lighter objects to sway perceptibly. Little damage resulted. A second Alaskan quake was reported on July 7 in the vicinity of Fairbanks. The only very severe disaster of the year happened on August 10 in European Turkey. Reports indicated a focus near the Dardanelles, from which it extended northward as far as Adrianople with decreasing violence; Gallipoli on the straits was practically laid to the ground and many of the villages along the northern and southern shores of the Sea of Marmora were seriously damaged. The loss of life was variously estimated, but according to the more moderate figures it probably reached 3000, with twice that number of injured. On August 18 a slight shock occurred in northern Arizona; it was felt at Williams, Holbrook, and other places, and was registered by seismographs many hundred miles away. Minor disturbances were reported in Chile on or about September 30, nearly coin-

cident with predictions of cataclysmic earthquakes, and caused a veritable panic among the lower classes. There were no serious consequences. A rather heavy shock was felt in the City of Mexico on November 19, but involved little damage.

SEISMOLOGY. In a recently issued treatise by Davison, earthquakes are divided into two classes: volcanic and tectonic. Those connected with volcanic energy are stated to be less important and destructive than the second class, which are related to differential movements of the rocks known as faults. It is thought that the fractures developed by folding may give rise to some earthquakes, but the more potent cause is abrupt displacement. This violent disarrangement of the strata is the culmination of intermittent stress, and the friction generated by the sliding of one rock-mass over another produces a series of vibrations which, propagated outward in all directions, appear at the surface as earth waves. As a general rule, the centre of the disturbance is not more than a few miles from the surface.

EASTERN FLEET. See NAVAL PROGRESS, *Great Britain, General Progress.*

ECHELON CLOUDS. See METEOROLOGY.

ECONOMIC ASSOCIATION, AMERICAN. The twenty-fifth annual meeting of the association was held in Boston December 27-31. The chief subjects dealt with were wages, banking reform, cost of living, agricultural economics and the economics of price regulation. Among the important papers read were the following: "Theory of the Minimum Wage," Henry R. Seager; "Rising Cost of Living," Irving Fisher of Yale University; "Banking Reform," by E. W. Kemmerer of Princeton University; "Economic Theory," by Simon N. Patten of the University of Pennsylvania; "Economics of Governmental Price Regulation," J. M. Clark of Amherst College, and Chester W. Wright of Chicago University. The presidential address was delivered by Frank A. Fetter and was entitled "Population or Prosperity." In connection with the meeting of the association were held meetings of the American Historical Association, the American Political Science Association, the American Sociological Society, the American Statistical Association, and the American Association for Labor Legislation. The officers elected for 1912 were: President, Frank A. Fetter, Princeton University; secretary, Thomas M. Carver, Harvard University. The association numbers about 2500 members.

ECONOMICS, SOCIAL. See SOCIAL ECONOMICS.

ECUADOR. An equatorial South American republic on the Pacific coast. Capital, Quito.

AREA AND POPULATION. The area is reported at 299,600 square kilometers (115,676 square miles); including the Galápagos islands, 307,243 square kilometers (118,627 square miles). The population, chiefly of Indian blood, is estimated at 1,500,000, though it is not unlikely that this figure is somewhat too large. The larger towns are Guayaquil (80,000), Quito (70,000), Cuenca (40,000), Riobamba (18,000).

EDUCATION. In his message of August 10, 1912, acting President Marín reported the number of public, municipal, and private schools at 1590, with 98,413 pupils and 2326 teachers. Higher education is carried on at the univer-

sities of Quito, Guayaquil, and Cuenca, and the law school at Loja; these institutions have 74 professors and over 600 students. The established religion is Roman Catholicism.

INDUSTRIES. Agriculture is the chief source of wealth. Valuable minerals exist, but have been little exploited. The most important article of manufacture is the Panama hat. Ecuador is one of the foremost cacao producers of the world. Besides this crop there are cultivated coffee, rice, sugar-cane, and tobacco.

COMMERCE. Imports and exports have been valued as follows, in thousands of sucres:

	1906	1907	1908	1909	1910	1911
Imports..	17,012	19,670	23,555	18,704	16,048	16,477
Exports..	21,965	22,907	26,559	24,879	27,333	28,062

The leading imports are cotton goods, food-stuffs, hardware, and machinery. Principal exports in 1910 and 1911, in thousands of sucres: Cacao, 15,792 and 21,057; vegetable ivory, 3339 and 4768; Panama hats, 2517 and 2584; rubber, 2012 and 2066; coffee, 1471 and 1536; gold, 498 and 1240; hides, 515 and 528. Trade by principal countries, in thousands of sucres:

	Imports		Exports	
	1910	1911	1910	1911
United Kingdom....	4,968	5,124	2,282	2,343
United States.....	4,509	4,629	8,181	8,399
Germany	3,148	3,232	4,496	4,616
France	1,053	1,081	9,588	9,844

COMMUNICATIONS. About 350 miles of railway were in operation in 1911, of which 297 miles were completed in the Guayaquil-Quito line. Work on the line from Bahía de Caraquez to Quito, begun in July, 1909, continued in 1912. A line from Manta to Santa Ana was begun June 30, 1911, and in the summer of 1912 construction trains were running to Montecristi. Telegraphs (1912), 3318 miles, with 60 offices; telephones, 328 miles.

NAVY. The navy includes one destroyer, one torpedo boat, three launches, one transport, and an auxiliary vessel.

FINANCE. The unit of value is the sucre, worth 48.655 cents (one-tenth of a sovereign). Revenue and expenditure in 1909 amounted to 15,877,684 and 15,564,882 sucres respectively; in 1910, 23,984,710 (including loans 10,416,258) and 22,047,254. Import duties in 1910 were 5,172,990 sucres, and export duties 2,922,221. Of the 1910 expenditure, 8,690,392 sucres were for the public debt, 4,231,887 for war and marine, 1,701,964 for interior and police, and 1,164,774 for public instruction. Estimated revenue and expenditure for 1913 balanced at 18,971,324 sucres. Public debt, June 30, 1910, 43,511,024 sucres; a loan of 3,000,000 sucres was negotiated in January, 1911.

ARMY. During 1912 no important changes were made in the military organization of the republic and the forces continued on the same basis, with progress being made in the enrollment of the organization of the first and second reserves, which supplement the small standing army maintained under the law of 1902.

GOVERNMENT AND HISTORY. The constitution of the republic bears date of December 23, 1906. The president is elected by direct vote for four years and is assisted by a cabinet of five mem-

bers. The legislative body consists of two houses, the Senate (32 members) and the House of Representatives (48). For the term beginning August 31, 1911, Emilio Estrada was inaugurated president in succession to Gen. Eloy Alfaro. Estrada died December 21, 1912, and was succeeded by Carlos Freile Zaldumbide, president of the Senate, as acting president. There began immediately a revolutionary movement, headed apparently by the friends of General Alfaro, which quickly developed into a fierce struggle, marked by acts of infamous barbarity. General Montero, a revolutionary leader, was proclaimed president by the army, but early in 1912 he was killed. Alfaro also was killed, and his body savagely mutilated. The speaker of the House of Representatives, Francisco Andrade Marin, became acting president. On March 31, 1912, Gen. Leonidas Plaza was elected president; he was inaugurated on Francisco Andrade Marin, became acting president in 1901-5 and was commander of the government forces which opposed the revolutionary outbreak of 1912. See ARBITRATION, INTERNATIONAL.

EDUCATION IN THE UNITED STATES.

STATISTICS FOR ELEMENTARY SCHOOLS. The public elementary schools enrolled 16,898,791 and private schools 1,441,137 pupils in 1910. About seventy-one per cent. of the population 5 to 18 years of age were enrolled in the public elementary schools. It costs, on an average, \$22.67 per pupil to support these schools. This is by far the lowest per capita cost in the entire educational system. Each student in the public high schools costs \$47.13, each student in public normal schools \$158.48, and each one in college costs \$303.48. The investment for build-

mated that there were at least 100,000 other secondary students in preparatory departments of colleges and universities, in normal schools and in certain manual and industrial schools, 44.23 per cent. of the high school students were boys. The schools employed 25,138 men and 32,102 women instructors. Of the 55,083 boys and 81,359 girls who graduated during the year, 47 per cent. of the boys and 27 per cent. of the girls had declared their intention of entering college, and 5746 boys and 14,505 girls had prepared for admittance to normal schools or other higher institutions. Among the entire number of high school students only 6.8 per cent. seem to be preparing for college. The students were distributed among the classes as follows: First year 41.90 per cent.; second year 26.75 per cent.; third year 18.34 per cent.; fourth year 13.01 per cent. It should be noted in connection with the low per cent. in the fourth year that only 88.31 per cent. of the students are in four year high schools. If all the schools offered four-year courses, there would be an increase in the students of the fourth year, and a consequent lowering of the per cents. in the other years.

The increases in the number of high school students during the past twenty years and particularly during the past ten years has been remarkable. The following table presents the facts regarding the number of students in high schools for each 1000 of population in 1910, the per cent. increase in high school enrollment, the per cent. increase in population, and the ratio between the per cent. increase in high school enrollment, and the per cent. increase in population for twenty years, 1890 to 1910, and also for ten years, 1900 to 1910.

Divisions	Enrollment in high schools for each 1000 population 1910	Per Cent. Increase				Ratio of per cent. increase enrollment to per cent. in- crease popu- lation

* Numbers in parentheses are for white population.

ings, grounds, and equipment for each child in the public elementary schools was about \$65. The corresponding investment for high schools was \$275, and for colleges and universities \$1100. The estimated expense for the public elementary schools for 1910-11 was \$383,127,609, and for private schools \$43,231,110. About seventy-two per cent. of the public school funds are raised by local taxation, though in some of the southern States only fifty-eight per cent. of the income is from local taxes. There are in the public elementary schools an average of thirty-five pupils to each teacher, while in the public high schools there are twenty-two students per teacher, and in colleges there is one instructor to each eight students.

STATISTICS FOR HIGH SCHOOLS. The Bureau of Education reports that during the year ending June, 1911, 10,234 public and 1979 private high schools enrolled an aggregate of 1,115,326 students, 88 per cent. of whom were in the public high schools. In addition it was esti-

A marked change seems to have taken place in the purpose students have in attending high schools. Over 18 per cent. of all the high school students in 1890 were taking courses that prepared for college. In 1900 the proportion had fallen to 14.53 per cent. and in 1911 only about 7 per cent. were taking college preparatory work. Mr. Willard J. Fisher in *Science* (November 1, 1912) comments on this change as follows: "Since 1890 the problem of the secondary school has changed from that of a fitting school to one of a decidedly non-fitting school—some bigots would say a decidedly *unfitting* school; a school in which only 6.8 per cent. of the pupils anticipate college work of any sort. This being the case, the colleges and universities can not lead the way in the fashion of 1892 and the committee of ten; the problems of secondary education can be solved only in the schools." It is interesting to see what difference this apparent change in the students' purpose, and the vigorous criticism of

the public high school have made in the popularity of various subjects. There has been an increasing per cent. of the students taking the following subjects. In each case the subject is followed by the per cent. of students taking it in 1910. English Literature (57.05). Algebra (56.92). Rhetoric (56.59). Latin (49.59). Geometry (30.87). German (23.60). French (11.70). The following subjects show a decreasing popularity: Physical geography (19.14). Civil government (15.99). Physiology (15.76). Physics (14.79). Chemistry (7.13). Trigonometry (2.18). Geology (1.35). Psychology (1.35). Greek (1.31). Astronomy (.88). The following subjects were not tabulated as early as 1905: Botany (16.34). Zoölogy (7.88). Agriculture (4.55). Domestic economy (4.14). Spanish (.65).

ILLITERACY. In the entire population above ten years of age illiteracy declined from 10.7 per cent. in 1900 to 7.7 per cent. in 1910. For further details of the report on this subject issued in 1912 by the United States Census Bureau, see the article **ILLITERACY**. The different methods of collecting the data make it impossible to compare directly the illiteracy in the United States with that found in other countries. The Bureau of Education gives the following comparative statistics for France, Germany, Great Britain, the United States, and certain European countries:

Country	Year	Per cent. Basis of estimate of illiterates
France	1906	11.4
German Empire.....	1905	.08
Great Britain.....	1904	1.5
United States.....	1910	7.7
Denmark2
The Netherlands....		1.4

a 1906-7.

b In 1907-8 for public schools only, enrolling 4,603,773 pupils, or 82.2 per cent. of the total enrollment.

PUBLIC SCHOOL ADMINISTRATION. The criticisms which have been directed against the public schools during the past few years were repeated in 1912. As in previous years they were based on the belief that the schools have courses of study overcrowded with "mummified and antiquated subjects," which have no relation to life, and as a consequence the methods employed in teaching tend to destroy rather than encourage initiative on the part of the child. There has been nothing new in the criticisms, neither has there been much that is new in the schools' methods of remedying the defects. The efforts of school officers and bodies of citizens have been directed toward a more thorough understanding of the factors that affect the efficiency of the schools. To this end there has been an increasing number of school investigations or surveys. The most important work of this sort was that undertaken in New York City by the board of estimate in 1911, and completed in June, 1912. The investigation cost about \$100,000 and was conducted by Prof. Paul Hanus of Harvard University with a group of assistants. The report of the investigation has not as yet been made public except that part of it which had to do with certain phases of the administration of the schools. This part of the report was written by Prof. E. C. Moore of Yale and was rejected by the board of estimate on the ground that it contained unsubstantiated statements. The issue of the report was awaited with much interest on account of the high professional standing of those participating in this investigation.

The Training School for Public Service connected with the New York Bureau of Municipal Research has conducted investigations of surveys in Dobbs Ferry, Syracuse, and certain counties in Maryland. Its most important undertaking was a collaboration with the Wisconsin State board of public affairs in studying rural school conditions and needs in Wisconsin. Investigators examined the conditions in twenty-seven counties in widely separated parts of the State, and they made a more detailed study of the conditions in 131 schools in thirteen counties. The report which was published in August sets forth in clear and concise form the conditions observed, both favorable and unfavorable. The final chapter is devoted to the discussion of fifteen suggested administrative and legislative remedies. A

similar investigation is planned for the high schools and normal schools of Wisconsin.

Two State superintendents of public instruction resigned in 1912: E. T. Fairchild of Kansas, to become the president of the New Hampshire College of Agriculture and Mechanic Arts, and J. T. Eggleston of Virginia to become rural school specialist in the Bureau of Education.

Two events have served to call particular attention to the educational work of New York State. On January 1, 1912, the new system of rural school supervision became operative. The legislature of 1910 abolished the office of school commissioner, and in its place created the office of district superintendent, the change to take effect in 1912. The law created a board of school directors in each supervisory district consisting of two members from each town, to be chosen at the general election. The sole duty of this board is to elect the superintendent of schools. The salary of the superintendent is \$1200, with a maximum expense allowance of \$300, both to be paid by the State. The tenure of office is five years. To be eligible to this office one must hold a life certificate to teach in any school in the State, and in addition must pass an examination in the teaching of agriculture. Superintendents must devote their whole time to the duties of their office, and they are required to forward detailed weekly reports to the commissioner of education. It is too early to form any just estimate of the efficiency of the system, but it seems to be fulfilling expectations. The boards of school directors made earnest efforts to secure the best available individuals for superintendents; 206 of the 207 required superintendents were selected before February. Of these, 62 were college graduates, 92 were graduates of State normal schools, 35 held life certificates, and 28 held teachers' permanent certificates. All had had experience in teaching.

On October 15, 16, and 17 a notable group of educators met in Albany to take part in the dedication of the New York State Education building. This building cost nearly \$5,000,000, and is said to be the most splendid and commodious building devoted wholly to education in the world. It will house the various offices of the education department, including the State library and the State museum. In the various addresses there were frequent references to the great credit due to Commissioner Andrew S. Draper, under whose leadership this vast undertaking was begun and completed.

Stratton D. Brooks resigned the superintendency of the Boston schools to become president of the University of Oklahoma. He was succeeded by Dr. Franklin B. Dyer, who resigned the superintendency of the Cincinnati schools. Randall J. Condon, superintendent of the Providence schools, went to the superintendency in Cincinnati. Both Boston and Cincinnati were reported to have raised the salary of their superintendents from \$6000 to \$10,000. Superintendent J. G. Callicut of Tocama became the new superintendent of Indianapolis.

This year marked the twenty-fifth anniversary of Dr. William H. Maxwell's connection with the administration of the New York City schools. A large company of prominent citizens met in Carnegie Hall to pay tribute to the man and the results of his work. Doctor Maxwell was presented with a chest containing

a silver service. The translation of the Latin inscription on the chest is as follows: "William Henry Maxwell for twenty-five years city superintendent of schools in Brooklyn and New York; given on account of his unique service, his loyalty, his zeal, and his courage."

VOCATIONAL EDUCATION. The demand for vocational education remains insistent. Progress has been in the same general direction as in the preceding year. Some new schools have been established, but school officers have been studying the results in the schools already working, and at the same time making a thorough study of the local conditions which vocational education must meet. There is a very great scarcity both of those who are able to direct the work and of those qualified to teach vocational subjects. The demand is for a new type of teacher, one who has, in addition to a liberal training, experience and skill in the industry he attempts to teach. Such men and women are not attracted by the salaries offered ordinary teachers. There is very general agreement among the advocates of vocational education that the federal and State governments must assist the communities in the establishment and maintenance of such schools. Their fundamental argument is that this type of education is expensive and that our workmen move from place to place so freely that the community which is at the expense of educating the workman has no assurance that it will ever profit by the investment. There is every indication that popular opinion favors such federal aid. There has, however, been a diversity of opinion as to how large an appropriation is needed, in what manner it shall be used and how its administration may be safeguarded. On February 26 Senator Carrol Page introduced Senate Bill No. 3 which is now known as the Page Vocational bill. This bill as modified would eventually appropriate in round numbers \$14,500,000 annually. This sum would be divided as follows: \$3,000,000 for the encouraging of instruction in agriculture, the trades and industries, and home economics; a like sum for the support of institutions in which only trades and industries and home economics shall be taught; \$3,000,000 for agricultural high schools; \$3,000,000 for extension work by the State agricultural colleges; \$1,000,000 for demonstration and experimental work at the agricultural high schools, the work to be under the direction of the State agricultural colleges; \$1,500,000 for the preparation of teachers for the schools contemplated by the bill. The administration of this appropriation is divided between the Secretary of the Interior and the Secretary of Agriculture. In general, the provisions of the bill make it necessary for the State and community to add two dollars to each dollar received from the government. The appropriation for the training of teachers is to be available at once, but the other sums are not to be available until July, 1916. The bill has the cordial support of many educational organizations. There are some who believe that the type of education proposed is still in such an experimental stage that we are not ready to employ economically any large amount of money. They see danger also in the divided authority over the administration of the funds. Whether the bill in its present form becomes a law or not, the fact remains that this bill

NEW YORK STATE EDUCATION BUILDING, ALBANY, N. Y.

1901

represents the most advanced thought on the subject.

WIDER USE OF SCHOOL PLANT. It was estimated that in 1910 a total of \$1,357,751,103 was invested in the State school systems. The average number of days that the school plants were in use for school purposes varied from 100 in New Mexico to 193 in Rhode Island. The average for the entire country was 157.5 days. These facts have been receiving very thoughtful attention from many sources, and as a result there is a strong agitation for a wider use of the school plant. This purpose is being accomplished in two ways: first, by a more economical use of the school plant for educational purposes, and second by allowing the buildings to be used for civic purposes and as social centres. The most conspicuous example of an economical use of school property is in Gary, Ind., where the pupils are organized into two groups, one group working in the classrooms while the other group is at work either in the laboratories or shops, or is on the playgrounds. This arrangement is said to double the capacity of school buildings. All-the-year schools are becoming increasingly popular. There are lecture courses for adults and also evening industrial and commercial courses. There is, however, a growing opposition to evening courses for those who have left school and entered the industries before they have the education required by the State. It is held that attendance at school after a day's work is a hardship and results in injury to the health; therefore such pupils should be freed from labor for a few hours each week at the expense of the employer and given more definite instruction in the schools. Such, in effect, is the law of New York State. Los Angeles, Milwaukee, Denver, Salt Lake, Grand Rapids, Worcester, and other cities use the school houses as polling places. During the presidential campaign, New York City opened school houses to the different parties for political meetings.

It is, however, in making school houses civic and social centres that the greatest progress has been made. Seven hundred and seventy-eight clubs of various characters were operated in the school houses of New York last year. A recent Wisconsin law orders that "where the citizens of any community are organized into a non-partisan, non-sectarian, non-exclusive association for the presentation and discussion of public questions the school board shall accommodate them in some school building and provide free of charge, light, heat, and janitor service." So important have these activities become that the architecture of school houses is changing, and the newer buildings contain provisions that were unknown in the earlier structures.

SECRET SOCIETIES IN HIGH SCHOOLS. The secret societies in high schools are a development of the past 35 years. This development took place with little attention on the part of school authorities, who generally were inclined to encourage rather than discourage the students in their efforts to organize. If arguments were needed to justify the existence of such societies, they were based on the social and educational possibilities of self-directed organization. Since 1900, however, school superintendents, high school principals, and teachers have been waging a determined warfare against these societies. Their fundamental arguments

are that such organizations are undemocratic and that the weak school spirit found in public high schools, unlike the strong college spirit, is unable to prevent a snobbishness that is extremely injurious to the welfare of both student and school. In the past five years the legislatures of thirteen States have passed laws against such societies. In at least twelve other States many of the most important cities have regulations which provide either for the suspension or expulsion of students joining secret societies, or make the students who become members ineligible to membership in any of the school organizations, such as musical and dramatic clubs, athletic and debating teams, etc. The courts before whom the question has been argued have shown a strong tendency to uphold the school boards. The States having prohibitive laws are: California, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Mississippi, Nebraska, Ohio, Oregon, Vermont, and Washington.

CHILD WELFARE. The year has seen a pronounced increase in the attention given to the welfare of children. The studies that have been made regarding the health of school children are tending to give a more accurate conception of the magnitude of the task before the schools. Prof. Thomas D. Wood, M. D., in an address before the National Council of Education, estimated that at least five per cent. of pupils in the public schools have now, or have had, tubercular diseases of the lungs, twenty-five per cent. have suffered from defective vision, and thirty per cent. have enlarged tonsils, adenoids, or enlarged cervical glands which need attention. In all, about seventy-five per cent. of the school children in this country need attention for physical defects which are partially or wholly remediable. Congress has established, in the Department of Commerce and Labor, a children's bureau, the purpose of which is to "investigate and report upon all matters pertaining to the welfare of children and child life, and . . . to especially investigate the questions of infant mortality, the birth rate, orphanage, juvenile courts, desertion, dangerous occupations, accidents and diseases of children, employment, legislation affecting children in the several States and Territories, and such other facts as have a bearing upon the welfare of children." Miss Julia C. Lathrop of Hull House, Chicago, was chief of the bureau at a salary of \$5000. Eleven of the fourteen States whose legislatures met in 1912 improved their child labor laws. The investigations bearing on the number of children who either fail to pass in school or who leave before completing the course tended to emphasize attention to the dullards, but now attention is also given to the unusually bright children. See **WELFARE WORK.**

BIBLIOGRAPHY. Among the important publications of the year are the following: Mabel Carney, *Country Life and the Country School*; *Vocational Education in Chicago and Other Cities* (report of a committee of the Chicago Commercial Club); Elwood P. Cubberley, *Improvement of Rural Schools*; Irving King, *Social Aspects of Education*; Maria Montessori, translated from the Italian by Anna E. George, *The Montessori Method*; Julius Sachs, *The American Secondary School and Some of Its Problems*; Edward L. Thorndike, *Educa-*

tion; Harland Updegraff, *A Study of Expenses of City School Systems*.

EFFICIENCY, MUNICIPAL. See **MUNICIPAL GOVERNMENT**.

EGYPT. A northeast African khedivate virtually under the control of Great Britain, nominally under Turkish suzerainty. Cairo is the capital. Area (estimate), 400,000 square miles (exclusive of the Sudan, of which only 12,013 square miles are cultivated and settled); population (1907), 11,189,978, not including nomadic Bedouins.

EDUCATION. Lord Kitchener's remarks on recent changes in the educational system will be of interest as having a wider application than originally intended. He says in part: "In 1910 an important and very interesting experiment was commenced, viz.: The handing over of local education to the recently constituted provincial councils. This new departure has introduced a much-needed elasticity and diversity into the system. It is premature at present to give any definite opinion on the result while the experiment is still in a somewhat indeterminate and provisional stage.

"As might have been expected, a considerable amount of divergence is apparent in the policy carried out by the different councils. In some there has been a tendency towards providing secondary education, instead of the very necessary elementary vernacular industrial and agricultural schools which are so much required in the provinces. One of the worst features of the elementary education hitherto supplied has been that it was restricted so largely to the cultivation of memory. An instruction that is merely 'bookish' leaves some of the most useful faculties of the mind undeveloped. Manual exercises train the eye to accuracy in observation, the hand to skill in execution, and the mind to a sense of the importance of truthfulness in work. What seems most required for progress in this direction is to evolve the best type of rural school, adapted to the special practical needs of agricultural districts, and when this has been done we may confidently hope to see a considerable increase in the number of boys educated. It must not be forgotten that any hasty or unthought-out development of education in rural districts, unless it is carefully adapted to rural necessities, may imperil the agricultural interests on which the prosperity of the country so largely depends. A rural exodus in Egypt would be an economic and social disaster of considerable magnitude."

AGRICULTURE. The newly organized department of agriculture began working regularly from the beginning of 1911. The area planted to cotton in 1910 was stated at 1,642,610 feddans, and in 1911 at 1,711,228—an increase of 68,618 feddans. Production, in 1911, of cleaned cotton, 3,318,529 metric quintals; estimated 1912 production, 3,602,327. Amount of sugar-cane treated in 1909-10, 515,839 tons (sugar yield 553,346 metric quintals); 472,344 in 1910-11 (493,942); 1911-12 estimate, 570,000 (580,000).

Much hardship has resulted from the dearth of cattle for plowing in the Delta, disease having carried off a quarter of a million of these animals in the seven years past. Increase of cotton pests, due to improper drainage and the wholesale destruction of birds, has wrought

havoc. Legislation has been passed for the protection of bird-life, and a commission was recently appointed to devise means for the suppression or better control of the cotton worm and boll-worm. The government has taken measures for the distribution of improved cotton seed; the amount sold in the spring of 1912 was about 40,000 ardebs, or about one-tenth of the seed required for the total area sown. See **AGRICULTURAL EDUCATION**.

The areas under cereals in 1911, according to the department of Direct Taxes, are shown in the following table, with total yield in ardebs and estimated yield per feddan:

	Feddans	Ardebs*	Ar. per f.
Wheat	1,237,821	6,882,300	5.56
Barley	370,143	2,124,000	5.74
Rice	227,109	1,321,000	5.82
Corn	1,772,686	12,320,000	6.95

* The ardeb varies, that of wheat being 153 kilograms; barley, 120; unhusked rice, 291; corn, 140.

IRRIGATION, ETC. The raising of the Assuan dam progressed steadily in 1911; the completion of the grouting up of the space between the new and the old work was scheduled for February, 1912, and the termination of the whole work for the end of the year. To quote again Lord Kitchener: "The monumental work of the raised dam and the immense benefits accruing by the increased irrigation of the country will repay the expenditure many times over. Other completed improvements include the giving of Seifi (summer) water to Upper Egypt, and the abolition of the basin system, which for so long has restricted the full yield of the land. Now that abundant irrigation water is assured, no effort should be spared to enable the inhabitants of Egypt to obtain the fullest advantage from their magnificent soil and climate; and the question of drainage, which has long been discussed, becomes one of vital importance. Measures have been approved for a large and comprehensive scheme of drainage in the provinces of Behera and Gharbieh, the result aimed at being the lowering of the water in the drains to a depth of from 1½ to 2 meters below the surface of the soil. . . The fellah remains the same as he has always been, one of the best and most hard-working types of humanity, somewhat conservative, like most cultivators, and hardly realizing the changes that have taken place around him. It is difficult for a people who have, through many ages, always striven for more water for their cultivation, to realize that too much of a good thing may be detrimental. It is, however, an incontestable fact that a considerable portion of the irrigation water now supplied is not only wasted, but does actual harm to the crops. [Hence] the urgent necessity for drainage works." See also **DRAINAGE**.

COMMERCE AND COMMUNICATIONS. The year 1911 witnessed a considerable increase in imports—£E27,227,118—as compared with the previous year—£E23,553,000. The total amount of exports in 1911, including cigarettes, was £E28,599,000, compared with £E28,944,000 in 1910. The total export of cotton fell from £E24,241,000 in 1910 to £E22,988,000 in 1911, the United Kingdom taking over £E1,000,000 less than in the previous year. Trade with the principal countries of origin and destination is

shown in thousands of pounds Egyptian
(£E1=£4,943.):

State railways, 2904 kilometers. The Marg, Khanka, Abou-Zabel line and the Ashmoun-Barrage line were opened for traffic in 1911; land was acquired for the Zifta-Zagazig line, the new Zifta station was completed, and satisfactory progress was made with the new bridges of Mansura, Assiut, and Embabeh; the new station at Alexandria was under way. The three light railways are the Egyptian Delta Light Railway, 952 kilometers; the Chemins de Fer de la Basse-Egypte, 109; the Fayum Light Railway, 169. The 40 kilometers of standard gauge between Cairo and Helouan (Egyptian Delta Light Railway Company) are being put into condition to operate.

Telegraph lines, 5913 kilometers (wires), 20,503). The extension of the Marsa-Matruh line from Sidi-Barani to Bagbag has been completed.

ARMY. The Egyptian army, in which all male inhabitants under the law are liable for service—6 years in the army, 5 years in the police, and 4 years in reserve—was maintained in 1912 at a peace strength of about 9000 officers and men, although there were available for conscription about 150,000 young men. The result is that the recruits are carefully selected and the various organizations carefully trained. The command of Egyptian troops in 1912 continued to be vested in Lieutenant-General Sir Reginald Wingate, who was also governor-general of the Sudan, and 188 British officers were attached to the Egyptian army. The effective war schedule was about 18,000, including 800 cavalry, 600 in the camel corps, 200 in Arab battalions, 1250 well-trained artillery, and 10,000 infantry. In May, 1912, Lord Kitchener, in a report, stated that while there was no change in the military condition of Egypt, arrangements had been made for concentrating troops in the Sudan at suitable points for effective action, and it was necessary to raise an equatorial battalion for the garrisoning of Mongalla, Bahr-el-Ghazal, and the upper Nile provinces. The British government in 1911 maintained 6063 officers and men in Egypt under the command of Major-General the Hon. J. H. G. Byng, C. B., to the maintenance of which the Egyptian government contributed £150,000. This force included 1 cavalry regiment, 1 horse battery, 1 mountain battery, 1 company Royal Engineers, 4 infantry battalions, the third battalion Coldstream Guards, and other details.

FINANCE AND GOVERNMENT. The financial condition of the country is best shown by excerpts from the report of the financial adviser (Sir Paul Harvey) on the budget of 1912: "The financial situation is satisfactory. The crisis of 1907, with its inevitable reaction on

public revenues, found the government engaged in heavy expenditure on great works of public utility. The indifferent cotton crops of 1908 and 1909, moreover, had a depressing effect on the revenue. This period is now over, and the corner has been turned. The series of [recent] failures in the banking and business community are due to causes antecedent to the present year. The failure of the Bank of Egypt was due, in a word, to an unsound system of business and finance initiated many years ago. The other failures may be ranked as a result, however, long deferred, of the speculative movement which came to an end with the crisis of 1907. The essential sources of the country's wealth and prosperity remain unaffected."

The revenue in 1911 amounted to £E16,793,000 (customs, £E2,169,000; railway receipts £E3,729,000; tobacco, £E1,669,000); expenditure, £E14,872,000. The budget for 1912 shows £E15,900,000 revenue and £E15,400,000 expenditure.

The total outstanding capital of the debt, December 31, 1910, was £94,972,200; charge on account of interest and sinking fund, £E3,571,000; paid off during the year £350,540; making a total capital December 31, 1911, of £94,621,660 and an annual charge of £E3,561,000.

Reigning Khedive in 1912, Abbas (II.) Hilmi. The British agent, consul-general, and minister plenipotentiary is Field Marshal Viscount Kitchener of Khartum, the real ruler of Egypt. No sittings of the international commission of judicial reform were held in 1911, but the modification of Article 12 of the Mixed Civil Code received the assent of the powers, by which a new legislative assembly with power to legislate for foreigners was established. Dissatisfaction has been expressed at headquarters with the policy of the provincial councils in devoting the full amount of their expenditure to education and neglecting their other duties toward the community—the establishment of better communications, bridges, drains, and improved sanitation. Plague increased in 1911, the number of cases being 1656, as compared with 1238 in 1910; the mortality increased from 50 to 60 per cent. The white slave traffic is becoming an important issue, but, as the trade is carried on by foreigners, subject only to their own governments, the Egyptian government and police are powerless to cope adequately with the evil. The sum of £E15,700 was granted in 1911 for the restoration of mosques and other Arab and Coptic monuments.

HISTORY

LORD KITCHENER'S ADMINISTRATION. During the first nine months of his administration as British agent and consul-general in Egypt, Lord Kitchener made three tours of the provinces to study local conditions and to discuss with persons acquainted with the facts the effect of the measures for improving the condition of the rural population. He was received everywhere with popular enthusiasm as the "friend of the fellahin." The chief aim of his policy was to promote the welfare of the agricultural population. To this end a number of important legislative measures were undertaken. His plans embraced laws for improving the public health, expediting the administration of justice, and protecting the fellahin from usury and other forms of economic injus-

tice. An important step in reform was the extension of the savings bank system to the country districts. Usury was made a penal offense. A plan was proposed for the exemption of small holdings up to five acres from seizure for debt. A system of justices of the peace was instituted in the rural districts where "cantonal tribunals" were to have jurisdiction over a certain range of questions that especially concerned the peasantry and depended on local customs. The sentences imposed could not exceed a fine of £5 or 24 hours' imprisonment. On July 4, Lord Kitchener left Cairo for England. The nine months of his régime were marked by more peaceful conditions in native politics. The rival factions were disposed to compromise and the bitterness between Copts and Moslems seemed less acute. Interest was apparently drawn away from party politics to the new measures of social and economic amelioration.

OTHER EVENTS. In the spring of 1912 a punitive expedition was led against the Anuaks on the Sudanese-Abyssinian frontier for their attacks on the Nuers, a tribe under British protection. In the middle of March, after traversing the Nuer country, the column fell in with the enemy, who resisted stubbornly, killing over forty, including several officers, but were defeated and driven into the forest. The general session was opened by the khedive on March 25. Among the measures to improve the condition of the country which the khedive announced in his speech, were the improvement of irrigation, creation of a department of agriculture, extension of education, and extension of the postal savings bank to the rural districts. An appeal having been made to the government to abolish the press law, which, during recent months, had suspended a number of newspapers, the government declared that the law would fall into disuse just as soon as the reasons for its existence disappeared. At a meeting of the Nationalist party Mahomed Farid Bey, the leader of the party, delivered a speech which the government held to be seditious. Farid immediately fled from the country, and action was brought against the directors of two native journals who, having published his speech, were accused of complicity. They were sentenced to three months' imprisonment. Sentence was recorded against Farid on April 10 of one year's imprisonment at hard labor.

Three Egyptians accused of conspiring against the lives of the khedive, the prime minister, and Lord Kitchener, were tried and found guilty in August. One was sentenced to fifteen years' hard labor, and the others to fifteen years' imprisonment, the maximum penalty in each case. A fourth prisoner, accused of complicity in the crime, was liberated. Appeal from the sentence by the counsel for the three prisoners was denied by the upper court. Several arrests were made early in September for seditious activity.

The king and queen of England visited Egypt in January on their return from India. The khedive visited their majesties at Windsor in June.

ELDER, CYRUS. An American lawyer and author, died December 14, 1912. He was born in Somerset, Pa., in 1843, and was educated in public and private schools at Utica, O. In 1856 he was admitted to the bar and in the same year was a delegate to the Republican national convention. He served in 1861-2 in the Civil War and in the following year settled in law practice in Johnstown, Pa. He was solicitor for many important steel corporations, and organized the Bessemer Steel Company, Limited. In the Johnstown flood his wife lost her life, and he was made secretary of the flood finance committee and had much to do with reorganizing the city. He was president of the Cambria public library and was editor of the *Industrial League Bulletin* and the *Farmers' and Mechanics' Almanac*, which were protectionist publications. He wrote also *Dreams of a Free Trade Paradise*, and *Man and Labor*. He also published several books of poems and a small book called *My Testament*, in which he strongly favored cremation.

ELECTION DAY, EMPLOYMENT ON. See LABOR LEGISLATION, *Miscellaneous*.

ELECTORAL REFORM. The various plans for the improvement of the electorate which have been advocated within the last few years, were discussed with renewed interest in 1912, on account of the attention given to them in political discussion, and by the candidates for the presidential office. With these plans there will be included in this discussion the initiative and referendum, although they are more properly related to legislation than to elections. Other devices which have been called "short cuts to good government" are provisions for direct primaries, the direct election of senators, legislation against corrupt practices in elections, and movements for an improved and simpler form of ballot. In most of the States in which the legislatures were in session in 1912, measures relating to these questions were either passed or failed to pass. In other States, elections were held on constitutional amendments providing for some or all of them. With the initiative and referendum is usually included a provision for the recall, although in most cases the recall is applied only in municipal elections.

INITIATIVE AND REFERENDUM. The Republican platform contained no indorsement of the initiative, referendum, and recall. President Taft's attitude toward these devices was in general that they were related to the States rather than to the national government, and that while they might be effective in some cases, he was not willing to give them his indorsement until they had undergone a further test. The Democratic platform contained no direct allusion to the initiative, referendum, and recall, but Governor Wilson's attitude toward the questions may be considered as being that of his party. In his academic writings before he had entered political life he had severely denounced them, but his political experiences had converted him to the belief that they were efficient methods for improving the electorate. Largely through his efforts while he was governor, the initiative, referendum, and recall were made a part

of the laws of New Jersey. Governor Wilson did not give any particular emphasis to the defense of these measures during the campaign.

No specific plank indorsing the initiative, referendum, and recall was included in the National Progressive platform, but in many of his addresses Mr. Roosevelt praised and defended them, although making the reservation that there might be cases in which they might be abused. Although there was more or less discussion of these measures during the campaign by presidential candidates and others, it was generally assumed that they did not enter largely into national questions, but related rather to the government of States.

The initiative, referendum, and recall were adopted in Idaho at the election on November 5. Vote was taken on the constitutional amendment submitted to the people by the legislature in 1911. A similar amendment was adopted by the voters of Nevada. The vote for the initiative, referendum, and recall was nearly 9 to 1. The new constitution of Ohio contains provisions for the initiative, referendum, and recall (see OHIO). Votes were taken on a constitutional amendment providing for these measures in Wyoming and it was carried. In Arizona, the initiative, referendum, and recall were included in the constitution adopted in 1911, and these were enacted into laws by the legislature which met in 1912. Other States which adopted the measures during the year were North Dakota and Nebraska. The question is to be submitted to the voters of Wisconsin in 1913. The Mississippi legislature discussed legislation looking to the submission of the initiative, referendum, and recall to the vote of the people of the State. The recall principle met with much opposition, and was finally rejected. A resolution was adopted providing for an amendment to the constitution incorporating the provisions for the initiative and referendum, and this amendment was submitted to a vote in the election on November 5. The amendment was lost, although it received a total of 25,153 votes against 13,383 votes. Under the constitution, however, it had to receive a majority of all the votes cast in the election, and the total vote cast by presidential electors was 64,948. Something over 26,000 voters did not vote either for or against it. The legislature of 1914 will undoubtedly submit the proposition again.

The States which have no provision for the initiative and referendum are: Alabama, Connecticut, Delaware, Florida, Georgia, Illinois, Indiana, Iowa, Kentucky, Maryland, Massachusetts, Michigan, New Hampshire, New York, North Carolina, North Dakota, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, Virginia, West Virginia, and Wisconsin.

In Illinois, although the initiative, referendum, and recall are not provided for by statute, there is a species of initiative enforced in the State by means of which certain questions of public policy are submitted at elections. The recall exists in cities and villages which have adopted the commission form of government. In Iowa there is also a recall provision in the law providing for the commission plan of city government. This is true also of Massachusetts. In this State the legislature of 1912 adopted an amendment authorizing the referen-

dum. This is to be referred for action to the legislature of 1913 before it can be submitted to the voters for adoption or rejection. In Michigan, while there are no statutory provisions for the initiative, referendum, and recall, the towns and cities which have the commission form of government are authorized to adopt them. Although there has been no legislation in New Hampshire relating to the initiative, referendum, and recall, the referendum is used in submitting proposed amendments to the constitution for ratification by the voters of the State. This has been the practice from the first adoption of the constitution. In rare instances, matters of legislation have been referred to popular vote before they become operative, one instance being the license law relating to the sale of intoxicating liquors. In North Dakota the legislature of 1912 passed an amendment to the constitution, referring the initiative, referendum, and recall to the people. It is now required that the legislature which meets in 1913 shall adopt or pass one or more of these amendments. If such action shall be taken the amendments so adopted will be submitted to the voters at the general election to be held in November, 1914. In North Dakota cities governed by the commission form of government are given the power to use the initiative, referendum, and recall. In Pennsylvania, measures will be introduced into the legislature of 1913 providing for the initiative, referendum, and recall; the recall to be applied to all city, county, and State officers, except the judiciary. In Utah an amendment was adopted in 1900 providing for the initiative and referendum, but the legislature has failed to pass the necessary measures to place this provision of the constitution in force. In West Virginia the city of Parkersburg has a provision for the recall of officials in its charter.

An important decision was handed down by the United States Supreme Court on February 19, 1912. This was the first judgment of the court made upon the constitutionality of the initiative and referendum. The decision in general was that only Congress, and not the supreme court, could object to the initiative and referendum. See WASHINGTON.

THE RECALL. As noted above, the recall of officers by election, held after the presentation of a petition signed by a proportionate number of those voting in the previous election, has found its use almost entirely in the cases of cities which have the commission form of government. The only instance of its usage in 1912 was in the case of Seattle, where the mayor was recalled and another election held (see WASHINGTON). A wider use of the recall was one of the most discussed features of the campaign of 1912, as the result of the advocacy by Mr. Roosevelt, in his speech before the Ohio constitutional convention, of a plan of recall of judicial decisions under certain conditions. Mr. Roosevelt's proposal was amplified in other speeches, especially in a speech made in New York City shortly after the Columbus address. These speeches are summarized in the article PRESIDENTIAL CAMPAIGN. This plan found no support in the platforms or campaign utterances of the Democratic and Republican parties. The Republican platform contained a plank which insisted on the necessity of upholding the courts, and was in effect a denunciation of the principle of the recall

of judicial decisions. The Democratic platform contained no mention of the proposal. The plank in the platform of the National Progressive party, advocating the measure was as follows: The Progressive party demands such restriction of the power of the courts as shall leave to the people the ultimate authority to determine the fundamental questions of social welfare and public policy. To secure this end it pledges itself to provide: (1) That when an act passed under the police power of the State is held unconstitutional under the State constitution by the courts, the people, after an ample interval for deliberation, shall have an opportunity to vote on the question whether they desire the act to become law, notwithstanding such decision. (2) That every decision of the highest appellate court of the State declaring an act of the legislature unconstitutional on the ground of its violation of the federal Constitution, shall be subject to the same review by the United States Supreme Court as is now accorded to decisions sustaining such legislation.

President Taft, in several speeches delivered during the campaign, denounced the principle of the recall of judges and judicial decisions as a most dangerous fallacy, and one that struck at the roots of the government. Governor Wilson, too, found no merit in the plan. Two States provide for the recall of judges under certain conditions. These are California, in which an amendment providing for such recall was passed in 1911, and Arizona, where the legislature in 1912 passed the recall measure which had in 1911 caused President Taft to veto the resolution providing for the admission of Arizona and New Mexico as States. See ARIZONA.

DIRECT PRIMARIES. The principle of direct primary elections for the choice of State officers, representatives to Congress, and delegates to conventions, received general support from all three candidates for the presidency in 1912. Chief interest centred in the presidential preferential primaries held in several of the States. This is discussed in the paragraph below. Nearly all the States have some form of provision for primary elections. In the few in which it does not exist, measures will undoubtedly be enacted providing for them within a few years. In States which have the direct primaries for local officers, the tendency is to extend them to the selection of all officers, and to the election of delegates to the presidential conventions. The complaint against direct primaries most frequently heard is that they destroy party organization; that no method can be devised by which party lines can be maintained and that nothing can prevent opposition party men from voting at a primary election because they cannot be identified. As a result of this condition it is possible for a man of the opposition party in the minority in the State or district to force the nomination of an unpopular man upon the majority and thus secure the election of a popular man in the minority party. These objections have so far not been fully met by advocates of the direct primaries.

Another serious complaint made against them is that there has been and will be manipulation by which an unfit man is selected simply by multiplying the number of candidates. In several States the law has been corrected to pre-

vent this. The usual method is the so-called "second choice plan." Wisconsin was the first of the States to pass such a plan. It was adopted in 1912 by Minnesota, and forms a part of the laws of Idaho, Washington, and North Dakota. The general theory of this plan is one of elimination. It strives to obtain approximately at least the majority nominees. The elimination is upon the theory of the elimination made by delegates in a convention, when the delegates drop their favorite, who has received the smallest number of votes among the candidates, and express their second choice by voting for one of the remaining candidates. This action is repeated until some candidate has a majority in the convention. In Minnesota the primary laws provide that if any candidate receives a majority he shall be declared the nominee and the second choice vote shall not be taken into consideration. If no candidate receives a majority, the elimination process is invoked. This is done by dropping the candidate who has the smallest number of first choice votes to his credit and adding the second choice votes cast by his supporters to the first choice votes of the remaining candidates for whom they were cast. If no candidate then has a majority, the process is repeated until some candidate has a majority or only two candidates remain. This general principle applies to the second choice plan in other States. For obvious reasons this provision is not made applicable to non-partisan offices. The names of the two highest candidates on the non-partisan primary ballot are placed on the general election ballot as the nominees, thereby giving the voter his second choice vote at the general election.

In addition to the "second choice plan," the law in Minnesota was extended to all State officers, United States senators, and justices of the State supreme court. Justices of the supreme court, all judges of municipal district and probate courts, county superintendents of schools, and all city officials in cities containing 50,000 inhabitants or more, are to become candidates without party designation and are voted for upon a separate non-partisan ballot and are in all particulars to be nominated and elected in a compulsory non-partisan manner. Thus the entire judiciary, educational officers, and all city officials of the large cities of the State are taken absolutely out of politics. In this respect Minnesota takes a position more radical than hitherto taken by any other State of the Union. A direct primary law was passed by the legislature of Kentucky in 1912. The new constitution of Ohio provides for direct primaries (see OHIO). The Massachusetts legislature also passed a direct primary law in 1912. Several measures relating to the direct primaries and direct elections were introduced into the legislature of Vermont, which convened in the autumn of 1912.

The States which have no provision for direct primaries are: Delaware, Indiana, New Mexico, North Carolina, Rhode Island, Vermont, and West Virginia.

Many of these primary laws include provisions for direct election of United States senators. In most of the southern States primary elections have been in operation for many years. In some cases, however, they are not the result of legal enactments, but are held by direction of State committees of the political

parties. In Tennessee the primary is voluntary. The Democrats operate under a primary plan and the Republicans under the old convention system. In Texas the primary for senator is advisory, although the legislature always elects the candidate nominated. In practically all the southern States a victory in the primaries is equivalent to election, as the Democratic party carries the dominant vote. As most of the State legislatures did not meet in 1912, there was little important legislation relating to direct primary laws.

DIRECT ELECTION OF SENATORS. The provision for direct election of senators is usually combined in some form with the direct primary laws. The passage by the 62nd Congress of a constitutional amendment providing for direct election of senators in all the States will, when it is ratified by two-thirds of the States, secure a uniform system for the direct election of senators. This amendment is in the form of a joint resolution. In its original form it provided that the control of elections should be taken from the federal government, where it is now secured, by Section 4, of Article 1, of the State constitution. This was defeated in the previous session of Congress by the vote of southern senators, who expressed a fear of negro domination if there should be federal control of the elections. The joint resolution was re-introduced in the first session of the 62nd Congress and was passed by the House of Representatives by a vote of 296 to 16. The Senate also passed this resolution with an amendment providing that the control of elections shall remain in the hands of the federal government. The provision did not emerge from conference in time to be passed at this session of Congress. It was passed, however, at a succeeding session (see CONGRESS). Three States voted favorably on the amendment in 1912.

The direct election of senators in some form is provided for in the following States: Arizona, California, Illinois, Iowa, Kansas, Maryland, Minnesota, Missouri, Montana, Nebraska, Nevada, New Jersey, Ohio, Oklahoma, Oregon, South Dakota, Texas, Virginia, Wisconsin, and Wyoming.

The original purpose of the plan of senatorial primaries for the direct election of senators was the elimination of the possibility of corruption in the State legislatures. It had, of course, the further object of securing practically the election of senators by direct vote of the people. These primaries as first held were comparatively inexpensive to candidates, but in the last few years there have been notable examples of lavish expenditures of money in the senatorial primaries. An instance of this is in the case of the election of Senator Stephenson of Wisconsin, who admitted the expenditure of \$107,000 in the senatorial primaries. Attempts were made in the different States by the passage of corrupt practices acts to remedy this condition, and the corrupt practices act passed by Congress in 1911 limits the expenditure in these elections to \$10,000.

CORRUPT PRACTICES. Several of the States passed stringent corrupt practices acts in 1912, and doubtless there would have been more had the legislatures of more States been in session. One of the most stringent laws is that passed by the Minnesota legislature. This act denies to the candidate the right to give anything of value to a voter. This includes

things as trivial as a cigar or a drink of liquor. Indiana enacted a corrupt practices act at the last session of the legislature. Other States having corrupt practices acts are as follows: Iowa, Louisiana, Maine, Maryland, Massachusetts, Missouri, New Jersey, New Mexico, New York, North Dakota, Ohio, Oklahoma, Oregon, Tennessee, Virginia, Washington, West Virginia, and Wyoming.

PRESIDENTIAL PREFERENTIAL PRIMARIES. The plan for indicating a choice for presidential candidate by popular vote received its first application in 1912. In 1911, the legislatures of several States had authorized the holding of such primaries. These States were New Jersey, Wisconsin, Nebraska, North Dakota, Washington, and California. In addition to these the legislatures of Illinois, Maryland, Massachusetts, Ohio, and South Dakota authorized the holding of presidential primaries in 1912. In most cases a special session of the legislature was convened for this purpose. Certain of the southern States, including South Carolina and Louisiana, provided for presidential primaries by formal statutes, and in Pennsylvania delegates to the national convention are elected by direct primaries and candidates for delegates are permitted to print on the ballot the name of the candidate for President whom they wish to support. This amounts in effect to a presidential preferential primary.

The platform of the Democratic party contained a plank directing the national committee to incorporate in the call for the next nominating convention a requirement that all expressions of preference for presidential candidates shall be given and the selection of delegates and alternates made through a primary election conducted by the party organizations in each State where such expression and election are not provided for by State law. The Republican platform contained no formal reference to the presidential primaries. President Taft during the campaign expressed himself in favor of these primaries when they were held under proper conditions. Preferential primaries otherwise held, he characterized as "soap-box primaries" (see **PRESIDENTIAL CAMPAIGN**). The platform of the National Progressive party contained no plank formally advocating presidential primaries, but throughout the campaign it was one of the leading issues with Mr. Roosevelt and the other Progressive candidates. Upon the results of the presidential primaries held in the various States Mr. Roosevelt based his assertion that he was the people's choice.

Presidential preferential primaries or primaries which were equivalent were held in the States of California, Illinois, Maryland, Massachusetts, Nebraska, New Hampshire, New Jersey, North Dakota, Ohio, Oregon, Pennsylvania, South Dakota, and Wisconsin. These elections are treated in detail in the article **PRESIDENTIAL CAMPAIGN** and in the articles on the several States. It may be noted here that the total Republican direct primary vote cast in these States was 2,284,163, while the Republican vote cast in these States in the presidential election of 1908 was 3,372,713, that is to say, there were about 1,000,000 less votes cast in the presidential primaries in 1912 than were cast in the presidential campaign four years previous. It is probable that this form of primary will have

become general in the States before the next presidential election.

For measures of electoral reform in foreign countries in 1912, see BELGIUM, FRANCE, GREAT BRITAIN, and other countries, paragraphs on *History*.

ELECTORAL VOTE. See **PRESIDENTIAL CAMPAIGN**.

ELECTRICAL INDUSTRIES. Throughout 1912 the electrical industries in America fully sustained the records of expansion set in previous years viz, about 15 per cent. The comparative estimates of the manufactures and value of electric service for 1911 and 1912, as formulated by a leading electrical journal, are as follows:

	1911	1912
Electrical manufactures..	\$325,000,000	\$350,000,000
Electric railway earnings	575,000,000	625,000,000
Central station earnings..	375,000,000	450,000,000
Telephone earnings.....	310,000,000	350,000,000
Telegraph earnings	75,000,000	85,000,000
Isolated plant service....	125,000,000	125,000,000
Misc. electric service.....	100,000,000	125,000,000
Total	\$1,885,000,000	\$2,110,000,000

An important aspect of this development was the growing tendency toward concentration. It is estimated that 90 per cent. of the electrical manufactures were produced by three concerns. More than 60 per cent. of the telephone earnings and more than 50 per cent. of the telegraph earnings were made by the Bell companies. The central stations are largely independent, but the percentage controlled by a few large syndicates has increased greatly during 1912. See also **DYNAMO-ELECTRIC MACHINERY**.

ELECTRICAL POWER, TRANSMISSION OF. See **TRANSMISSION OF ELECTRICAL POWER**.

ELECTRIC BATTERIES. The developments in the field of electric batteries in 1912 were mainly commercial. One new type was reported, the nickel-iron cell of Gouin. The positive electrode consists of perforated tubes of nickel, filled with specially prepared hydroxides of nickel, mixed with powdered graphite. These tubes are reinforced with twisted nickel wires and are nested horizontally in a nickel frame. The negative grids consist of thin iron wire plaited into flat ribbons, carrying protoxides of iron. The inventor claims that it rivals the Edison cell in lightness and life and is on a par with the lead cell in first cost.

The greatest advances of the battery are in the vehicle field. It is conservatively estimated that there are now in America 80,000 electric storage-battery vehicles, of which about 26,000 were produced in 1912. The projected production of electric vehicles for 1913 is 40,000, and the value of the storage batteries for the new cars will probably amount to \$25,000,000. A number of important installations of stand-by batteries were made on city distribution systems, the discharge capacity in some cases being as high as 44,000 amperes. See **DYNAMO-ELECTRIC MACHINERY**.

ELECTRIC LIGHT AND POWER. See **MUNICIPAL OWNERSHIP**.

ELECTRIC LIGHTING. In the field of incandescent lamps, 1912 was marked by the complete decline of the carbon filament. The

metallized carbon type was largely adopted by central stations for free renewals. Its general performance is much more economical than that of the carbon lamp, though somewhat more fragile and of shorter useful life. Steady improvements in the tungsten filament and reductions of price have greatly increased its use. The earlier lamps, especially those of high power, showed a tendency to blacken the bulb which greatly reduced the available period of service. A bulb-blackening preventive has been applied with great success. A severe test of tungsten lamps made in subway trains showed that but 15 per cent. of the lamps failed electrically or through breakage in 1000 hours of burning. The use of miniature lamps for automobile lighting and the local illumination of machinery was very greatly extended. Important developments were made in long-life flame arcs. By proper restriction of the air supply in conjunction with the purging of the gas in the arc chamber from fumes it is possible to obtain a life per trim of 120 hours or more, with good efficiency and well-sustained candle-power. These results make the flame arc an important factor in street-lighting, where in the past the expense of the frequent renewals has been a great handicap. The fluorescent rhodamine reflector has been successful in correcting the color of light from the glass-tube mercury arc. Green rays absorbed by the reflector are converted into red and the combined spectrum is approximately white.

The high-pressure quartz-tube mercury arc, which was used to some extent in Europe in preceding years, reached the commercial stage in America in 1912. While not white, the light of these lamps is much better balanced in color than that from the glass tube arcs, and is very satisfactory for out-door illumination. Lamps of this type have a high efficiency of about 4 candle-power per watt, and the quartz tubes give a life of from 1000 to 2000 hours, after which the lamps fail through loss of vacuum. The tubes can then be renewed at a cost of from \$6 to \$12. It is confidently expected that improvements in the art of quartz working will lower the cost and increase the life of the tubes to the point where the renewal cost of such lamps per annum will be much less than the present cost of trimming street arcs. In such a case the quartz tube lamp should assume great importance in street lighting. The first installation for the purpose was made in Chicago. The radiation from the quartz-tube lamp is rich in actinic rays, making it a powerful and efficient sterilizing agent. One lamp can sterilize 500 cubic meters of water per day if the water is caused to flow in a thin sheet over an area on which the radiation is concentrated. This process has been commercially established in Chicago and in St. Petersburg, Russia. European inventors have brought out a number of types of 3-phase, alternating current arc lamps. In general these have three electrodes, each capable of lateral and longitudinal motion, so that three symmetrical arcs are maintained. Such lamps are claimed to give an efficiency of 10 candle-power per watt and to be very long-burning and low in renewal cost.

Methods of illumination in which the lamps are wholly or partially concealed and the light derived from white ceilings and walls gained greatly in favor. These indirect methods are less efficient than the direct. Their advantages

are largely the elimination of glare and the pleasing architectural effects which they make possible. Artificial methods of producing the color quality of daylight have reached a commercial development. In general these take the form of a composite screen of colored glass which absorbs from the artificial light those rays which are in excess of daylight proportions. This filtration process as applied to the tungsten filament lamp yields an efficiency of about 13 per cent., hence is rather costly for general use.

ELECTRIC RAILWAYS. The most significant developments in electric railroading in 1912 related to the high-voltage direct current system. The aggregate mileage in America equipped for such operation reached and exceeded 1000 route-miles, and the rolling stock comprises over 500 motor cars and locomotives. The standard trolley voltages for this system are 1200, 1500 and 2400, the latter adopted for the first time in 1912 for the Butte, Anaconda and Pacific Railway. The motive power in the latter case is to consist of pairs of 1200-volt motors in series. The largest high-voltage, direct-current system yet projected is involved in the accepted plans for the electrification of the suburban railways of Melbourne, Australia. This system includes 250 miles of track and will require 500 motor cars and a number of large locomotives. A voltage of 1500 was chosen after an exhaustive investigation of all proposed systems. Important extensions were made in the single-phase system of the New Haven Railroad. This company announced its intention of extending this form of operation to the four-track division between Boston and Providence in 1913. The estimated cost is \$7,000,000.

A number of very important projects of electrification of suburban systems were inaugurated in European cities in 1912. Among these are the unification of the surface tram system in Paris and its electrification with direct-current equipment, using conduits in the central districts and trolleys in the suburbs. The Western State Railroad of France has undertaken the electrification of its Paris suburban system. A beginning was made on the electrification of all the city and suburban lines of Berlin with the single-phase system at 15,000 volts and 16½ cycles. This task was made necessary by the present congested state of the system, and, when complete, will practically double the traffic capacity of the existing trackage. The work will cost about \$31,000,000, and will require four years for its completion. Electrification plans have been announced for the suburban sections of the London and Northwestern and the London and Southwestern systems, in which the use of direct-current systems is contemplated. The direct-current system at 1100 volts was installed on a number of the city lines in Budapest.

The use of the light-weight storage battery car has been much extended. This system is employed in some cases with three-car trains operated from a single point by the multiple unit system. Large storage battery cars have appeared as rivals of the gasoline-electric cars on branch lines of standard railroads.

EMPLOYERS, WELFARE OF. See WELFARE WORK.

EMPLOYERS' LIABILITY. Since the enactment of the Workmen's Compensation act in Great Britain in 1897 such legislation has become practically universal among western nations. The old liability laws imposed obligations on the employer only in case the injured worker could break down the common-law defenses of assumed risk, contributory negligence, and the fellow-servant rule. Experience showed that under such conditions the injured worker often failed to receive any financial relief whatever and was frequently forced to assume a heavy financial burden in litigation only to lose finally because of inability to carry his case to higher courts. Gradually the common-law defenses were broken down. The new legislation aims to give compensation for injury according to some definite plan without imposing litigation expenses on the worker. See WORKMEN'S COMPENSATION.

In the last two years workmen's compensation laws have been passed in the States of Arizona, California, Kansas, Maryland, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, Ohio, Rhode Island, Washington, and Wisconsin; and federal laws extended the compensation act of 1908 to artisans and laborers in hazardous work under the Bureau of Mines and the Forestry Service. The State laws are drawn up on the basis of one of several distinct plans. They provide either for direct compensation by the employer, as in New Jersey, or for insurance by the employer under more or less State supervision. Such insurance may be compulsory, as in Washington, or optional, as in Massachusetts, Minnesota, and Ohio. Moreover, this insurance may be wholly in the hands of the State authorities, as in Washington and Ohio, or left to private companies under State scrutiny, as in Massachusetts and New Jersey. In Ohio the State insurance fund is a general one for all industries, but in Washington there is a separate fund for each industry. The Washington law is the only one thus far enacted which has been an out-and-out compulsory law. The reason for this is that the State courts have refused to uphold the constitutionality of such legislation with coercive features. A New York law enacted in 1910 applying to a specified list of dangerous occupations was thus declared unconstitutional. Consequently with the exception noted the States have made compensation laws optional. The success of an optional law is increased greatly by making it easier for the employer to accept it than to remain under the employers' liability law: this may be done by presuming all who do not give express notice to the contrary to have accepted the act, as in New Jersey, and by lower costs. These laws have quite uniformly removed the common-law defenses, but in Massachusetts these defenses are all restored to any employer accepting the compensation plan, and in Kansas and New Jersey willful neglect on the part of the worker is made a bar to compensation. A compensation law may

apply to all trades, as in California, New Jersey, and Ohio, or only to a specified list deemed particularly hazardous. The development of compensation legislation has seemed to favor the adoption of some plan of mutual insurance for employers. This scheme has the advantage of spreading the loss due to industrial accidents over a large body; and at the same time guarantees to the worker his compensation regardless of the financial status of his employer. Insurance schemes may be contributory or non-contributory, depending on whether the workers are or are not required to contribute to the fund. Most States have made provision for an administrative board to have charge of the enforcement of the compensation act; such was not the case in New Jersey. Where a board is provided it is usually authorized to adjust all claims; in New Jersey such adjustment was left to the courts.

OHIO PLAN. The compensation law passed by the legislature in 1911 was tested in the courts in 1912, although the legislature had previously secured a prejudgment from the State Supreme Court that the law was constitutional. Against the law it was argued in the first place that it was an unwarranted exercise of the police power. This the court denied. In the second place it was argued that the law took private property without due process of law. This the court held to be unfounded as the act is not coercive, but optional. In similar manner the court denied that the act deprives any party of freedom of contract or impairs the obligation of contract, nor does the law make any arbitrary discrimination, but acts uniformly on all persons brought within its scope. As this decision indicates, the Ohio law is optional. It provides for the creation of an insurance fund to which employers shall contribute 90 per cent. and employees 10 per cent. The law provides that if any employer accepts the plan his employees must accept it also; if, however, the employer rejects it he loses the protection of the common-law doctrine. The board of three commissioners appointed to administer the law drew up a tentative schedule of insurance rates; this schedule was to be subject to revision at the end of six months. The law aroused very lively competition on the part of the liability companies, which was met in part by a campaign of education by the commissioners. The latter have endeavored to induce employers to improve their plants by providing maximum and minimum rates for each industry.

NEW YORK LAW. Following the declaration by the New York Court of Appeals in 1911 that the Wainwright compensation act was unconstitutional, the friends of such legislation were divided between those who favored a constitutional amendment, those who favored the passage of an optional law, and those who favored another compulsory act of wider scope. Various bills were thus presented to the legislature; one was based on the Washington compulsory State insurance law; one was based on the Ohio optional insurance law; and a third was a scheme of optional compensation without the idea of mutual insurance. None of these were passed. The legislature, however, adopted a proposed amendment which, if approved by the next legislature and by popular vote in November, 1913, will become a part of the State constitution. Among other things

this resolution says: "Nothing contained in this constitution shall be construed to limit the power of the legislature to enact laws for the protection of the lives, health, or safety of employees; or for the payment, either by employers, or by employers and employees or otherwise, either directly or through a State or other system of insurance or otherwise, of compensation for injuries to employees or for death of employees resulting from such injuries, without regard to fault as a cause thereof, except where the injury is occasioned by the willful intention of the injured employee or results solely from the intoxication of the injured employee while on duty."

WASHINGTON LAW. One of the most advanced compensation laws was that enacted in Washington in 1911, and upheld as constitutional in October, 1911. This law is based on the principle of insurance, the administration of which is in the hands of State authorities. Moreover, it is compulsory. Employers are divided into classes according to degrees of risk to workers and rates of assessment are then apportioned to the estimated risk. These rates are fixed in the law, but the Industrial Insurance Commission which has charge of the administration is authorized to levy upon the various classes of employers only so frequently as actual needs may require. The summary for the year ending September showed 5750 firms listed and assessed; 130,000 employers; 11,896 accidents reported; 6984 claims allowed; 2256 claims disallowed or suspended; 2656 claims still unadjusted. The commission received \$980,446 for the accident fund and paid out on claims \$445,528. It invested as a reserve to guarantee compensations \$245,985 and had a cash balance of \$290,933. In addition the commission paid for its own expenses out of legislative appropriations \$107,000, or about 10 per cent. of the total funds handled. This ratio of expenses was believed to be extremely low. Results of the first year's experience showed that the rates of assessment provided in the law were much larger than necessary. A few appeals were taken from the commission to the courts; and 43 suits were begun against employers who defaulted in their payments.

OTHER PLANS. During 1912 the States of Arizona, Maryland, Michigan, and Rhode Island adopted the principle of workmen's compensation in place of the older principle of employer's liability. The Arizona law provides compulsory compensation for a list of especially dangerous occupations. The Michigan law applies to all employees but farm and domestic servants and casual workers. It is semi-optional, the employers having the choice of various methods of payment, the yearly choice of employers to be filed with an industrial accident board. The members of this board are to serve for six years at an annual salary of \$3500. An employee must give express notice if he does not wish to come under the law. The law provides for medical benefit for not more than three weeks; for death payments amounting to 50 per cent. of wages, but not to exceed \$10 per week for not more than 300 weeks; for payment in case of total incapacity of 50 per cent. of wages for not longer than 500 weeks; and in case of partial incapacity of one-half of the loss of wages for not more than 300 weeks; the payment in the case of certain bodily members to be according to a fixed legal

scale. The employer is allowed four methods of paying the compensation: Self insurance, a liability insurance company, a mutual employer's company, or an accident fund administered by the State commissioner of insurance.

The Maryland law is purely optional. If the employer chooses to accept the compensation idea he may insure in a liability company or, if he has as many as 1500 employees, in a mutual benefit fund. The State commissioner of insurance has charge of the administration of the law. The rates of compensation in the Maryland and Rhode Island laws are almost identical with those provided in the Michigan act above described. The Rhode Island law is also similar to the Michigan law in that it is semi-optional. It, however, contains the beneficent provision that unless the employee expressly states otherwise he is presumed to accept the law.

The legislatures of 1911 and 1912 created ten commissions for the investigation of employers' liability and workmen's compensation; moreover, some of the commissions previously appointed have not yet reported. The Michigan and Maryland commissions preceded the legislation already described. The commissions of Pennsylvania, Colorado, North Dakota, Minnesota, Delaware, Texas, Connecticut, and West Virginia are expected to report early in 1913. The Missouri commission was compelled to give up its work because of an adverse opinion by the attorney-general as to the legality of the appropriation for its maintenance. The Iowa commission made a special investigation of the working of the different systems of compensation in operation in New Jersey, Ohio, and Wisconsin. The Nebraska commission met with special difficulty in the matter of compensation for agricultural laborers. The Pennsylvania commission drew up a compensation bill providing compensation, not only during the customary 300 weeks in case of total permanent disability, but also at lessened amount during life.

FEDERAL COMMISSION. The United States Employers' Liability and Workmen's Compensation Commission's bill, promoted by the American Association for Labor Legislation and the National Civic League and introduced in Congress by Senator Sutherland on February 20, provided compulsory compensation for accidents or deaths, except when caused by willful neglect, for all except casual employees of interstate railways. The bill provided for adjustment of claims either directly by employer and employee, or by an adjustment committee chosen by the employer and employees, or by a federal adjuster. The latter would be a permanent official appointed and removable by the United States District Court and having certain powers to summon witnesses and take testimony. Medical benefit to the amount of \$200 was provided. Periodic readjustment of compensation on the basis of medical examination was also provided for. The death benefit was made equal to 40 per cent. of the wages in case a widow survives; 50 per cent. for a period not to exceed eight years in case a widow and one or more children under 16 years of age survive; 25 per cent. in case no widow, but one child survives, with an addition of 10 per cent. for each additional child up to a total of 50 per cent. If the deceased should leave no widow or children but depend-

ent parents the compensation would be 25 per cent. of wages if one and 40 per cent. if both survive. Various other special compensations are provided for the various possible dependents. In case of permanent total disability the compensation would be 50 per cent. of wages for life. In case of permanent partial disability compensation would be 50 per cent. of wages for periods varying from 72 months for the loss of one arm to 5 months for the loss of the fourth finger. The bill provided that these monthly payments might be commuted for a lump sum after the lapse of 6 months. In all cases the wages were to be computed on a basis of 28 days in a month, but no wages were to be considered as above \$100 a month or as below \$50.

It must be understood that the United States had already provided in 1908 compensation for artisans and laborers employed in certain branches of the government service. The amounts of compensation paid under this law from August 1, 1908, to October 1, 1912, slightly exceeded \$1,100,000. During the first year 1889 claims were granted and during the second year 2499.

CONSTITUTIONALITY OF FEDERAL LAW. There has been much debate over the question whether Congress has the authority to enact a general workmen's compensation law. Considerable light was thrown on this question by the decisions of the United States Supreme Court handed down January 15, 1912, in various cases involving the constitutionality of the federal employers' liability act as amended April 5, 1910. In these cases the Supreme Court unanimously concluded that the congressional power to regulate commerce includes power to force interstate common carriers to assume liability for accidents to employees. The court declared that no person has any property or vested interest in any rule of the common law; consequently Congress may take away the common-law doctrines behind which employers had defended themselves against liability and may substitute therefor the principle of employers' responsibility. This applies to the fellow-servant doctrine, to the principle of contributory negligence and the doctrine of assumption of risk. Moreover, the court held that any enactment of Congress on this subject would take precedence of conflicting State laws. In addition the power of Congress in this matter is not restricted to interstate common carriers, but may be extended to all persons or corporations engaged in interstate commerce. This decision was thought by many to form a basis for a much broader workmen's compensation law than that provided in the bill presented by the federal commission as above outlined. Although that bill, applied to nearly one and one-half million railway employees, legislation applying to the great corporations likewise carrying on interstate trade would extend federal protection to additional millions of workers.

CANADIAN PLAN. After twenty-one months' work the Canadian Workmen's Compensation Commission submitted a partial report in July. On the whole this commission favored the establishment of a mutual insurance fund. It found that employers desired that the workmen be required to pay 10 per cent. of the cost of an insurance scheme, whereas the representatives of labor on the other hand insisted that the

employers should bear the entire cost. Before submitting its recommendations for legislation the commission expected to gather additional information on this question and to work out many problems of administration.

THE BREWING INDUSTRY PLAN. During recent years a number of the larger employers of labor, including the United Steel Corporation, the International Harvester Company, and various railroads, have instituted voluntary compensation schemes. None of these, however, were as liberal as the plan drawn up by a joint committee representing the Brewers' Association and the International Union of United Brewery Workers of America. A comprehensive plan providing for accident prevention, accident compensation, and old-age pensions was agreed to. Penalties are provided for those employers who fail to install safety appliances as recommended by a board of directors and award. The fund for the payment of benefits will be provided by each employer paying 1.5 per cent. of the amount of his pay-roll and each employee 0.5 per cent. of the amount of his wages. Complete recognition of the union is shown by the fact that the higher officials of the union are included in the scheme. The benefits include first aid for all injuries. In case of partial disability the compensation equals 65 per cent. of wages after the first week, unless disability continues more than four weeks, in which case compensation is given for the first week also. In case of total disability not resulting in death the workman will receive 65 per cent. of his wages for five years, in weekly amounts of not less than \$5 nor more than \$20. In case of death the dependents will receive a sum equal to 300 times 65 per cent. of the deceased's wages, but not more than \$3400. For the retirement pensions plan, see **WORKINGMEN'S INSURANCE**.

ENGLAND. See **GREAT BRITAIN**.

ENGLISH PHILOLOGY. See **PHILOLOGY**.

ENTOMOLOGY. GIPSY MOTHS, ETC. The gipsy moth problem continued to attract attention during 1912, and L. H. Worthley, an employee of the Bureau of Entomology, was sent to Europe in January to investigate possible parasites of this insect. The entomologist of the Dominion of Canada reported that much damage had been done by both gipsy and brown-tail moths in Nova Scotia and New Brunswick and that gipsy moth eggs and larvæ had been found on nursery stock imported from Japan. Much alarm was also felt in the United States over the possible importation of this pest from Europe on fruit and ornamental trees. To guard against the further spread the federal government established a quarantine against certain areas in all of the New England States except Vermont, forbidding the transportation of deciduous trees, florists' stock and Christmas trees from the quarantined area to other parts of the country unless properly inspected and determined to be free from gipsy and brown-tail moths. The gipsy moth quarantine covered also logs, tan bark, railroad ties, and similar products.

Calosoma sycophanta, a beetle imported from Europe, where it eats gipsy moth larvæ, was reported to have secured a good foothold in Massachusetts, though as it requires about three years to develop sufficiently to be easily noticed it has not yet done much toward exterminating the pests. Britton reported that in Connecti-

cut the Stonington colony of gipsy moth is apparently exterminated, as none have been seen since 1910, and only a few are to be found at Wallingford. The brown-tail was reported as spreading southward in the State.

In the vicinity of Boston and along the Connecticut shore the leopard moth was reported as especially troublesome. This is chiefly a town and city insect, not spreading into the country, where it is possible that woodpeckers keep it in check by eating the boring larvæ.

HOUSE FLIES, ETC. The house fly problem also attracted much attention during 1912, numerous "swat the fly" campaigns having been inaugurated. No very satisfactory or practicable methods for trapping the insects seems to have yet been found, and the practice of destroying all breeding places seems to be the most feasible method of elimination, though this would be more successfully carried on in the city than in the country, where breeding places are so much more numerous. Grasshoppers did much damage in Colorado and Minnesota during 1912, and in the latter State a mixture of sodium arsenate and molasses devised especially for destroying grasshoppers proved to be fatal to many flies. The suggestion was made that a mixture of eight ounces of sodium arsenate, with one pint of molasses in twenty gallons of water, would, if sprayed over piles of horse manure in which flies are breeding, be efficient in killing off the larvæ. No mention was made of the possible effect of this poison on the value of the manure as fertilizer.

Observations reported in 1912 apparently make it certain that the stable fly, *Stomoxys calcitrans*, is responsible for the transmission of infantile paralysis. This fly should not be, as happened in some cases in the public press, confused with the house or "typhoid" fly, *Musca domestica*.

The total appropriation for the United States Bureau of Entomology for the year beginning July, 1912, was \$691,840.

COLORATION. The Davy prize was awarded in 1912 to a paper by Pictet, "*Recherches experimentales sur les mecanismes du melanisme et de l'albinisme chez les lepidopteres*." In this paper Pictet showed that wing color is due either to pigmentation or to structures producing interference phenomena, the two being in inverse ratio to one another. Melanism appears if there is much pigment in the scales, or if the pigment becomes more opaque or if the scales either increase in size or become more numerous. Albinism appears if the conditions are opposite to those just mentioned. He regarded melanism as a sign of vigor and health, while albinism indicates an enfeeblement of organs. Lovell, as the result of experiments on insect vision, concluded that while insects will visit green flowers in search of honey, just as they will visit other inconspicuous places, they are much more apt to visit conspicuous flowers, indicating a well-developed sense of sight.

Fiebrig, in an elaborate paper, gave his results on a study of insect sleep, in which he showed that insects do assume a sleeping posture, frequently an "upside down" one, comparable to that assumed by mammals, holding themselves firmly to plant stems by their mandibles. The wings and legs are relaxed and have no supporting function during this period.

At this time light and other stimuli affect the insects in much the same way as they do in other animals.

It was reported during the year that hickory trees in the eastern United States are being killed by a beetle, *Scolytus quadrispinosus*, which excavates tunnels under the bark. The only remedy seems to be to mark infected trees in the summer, and some time between October and March, when the young are under the bark, to kill the trees and burn the bark. If not too seriously infected the portion attacked may be cut out and burned instead of cutting the entire tree. A walnut weevil was reported from Connecticut, whose attacks can be prevented in large part by spraying with lead arsenate. Experiments reported by the United States Bureau of Entomology indicated that a single thorough application of lead arsenate applied to apple trees just after the petals have fallen, is sufficient to control the codling moth, though unless very carefully done this is not as efficacious as the usual two-spraying method. There was a temporary decrease owing to climatic conditions in the number of boll weevils in Texas, but this gives no reason to believe that the improvement is more than temporary. The insect appeared for the first time in Florida in 1912.

The second International Congress of Entomology met at Oxford, England, in August, under the presidency of Professor E. B. Poulton.

ERICHSEN, MYLIUS. See POLAR EXPLORATION.

ERITREA. An Italian colony on the west shore of the Red Sea. Estimated area, 45,800 sq. miles; population, 279,000. Asmara is the capital. Salt is an important product, being sent to southern Abyssinia, where it is the monetary currency. Imports 1910, 16,372,830 lire (17,225,720 in 1909); exports, 7,277,865 (6,845,026); transit, 3,857,351 (3,152,380). Tonnage entered, 183,532 (171,155). The railway from Massowah to Asmara was finished in 1911; it will be extended to Keren and Agordat. Estimated revenue (1910-11), 8,977,750 lire (state contribution, 6,350,000); expenditure, 7,223,700 (military administration, 3,988,200). Giuseppe Salvago (Marquis) Raggi was governor in 1912.

ESPIONAGE. See GERMANY.

ETHICAL CULTURE, SOCIETIES FOR. The first society was founded in 1876 by Felix Adler, in New York, for the purpose of uniting people of varying religious beliefs or none, in the ordinary acceptance of the term, upon a basis of a devotion to the moral ideal. The movement extended to other cities, and now societies of ethical culture are found in nearly all the larger cities in the United States. The most important events in the history of the society during the year were, first, the Moral Education Congress, which was originated by the International Ethical Union held in August at The Hague, and second, the dedication of the meeting-house of the Ethical Society of St. Louis, which took place in the early part of October. There was also greatly renewed activity in the work of the Chicago Society for Ethical Culture. This was due to the new leadership of Mr. Horace Bridges of London, who took charge in October. The Philadelphia Society for Ethical Culture started during the year, the movement for a new meeting-house, and an active correspondence bureau, established in Madison, Wis.,

has had considerable success in disseminating literature in connection with the society's propaganda for moral education in public schools. The president of the New York Society is Dr. Felix Adler.

EUGENICS. A noteworthy event of the year was the meeting of the first International Eugenics Congress at the University of London, July 12-30 under the presidency of Major Leonard Darwin. The general spirit of the congress was conservative. It was called to afford a chance for a free interchange of views and not to determine a definite propaganda. It did not put forward a platform or even unite on any general proposition in regard to the eugenics movement. But while this indeterminate course was unsatisfactory to the more radical and enthusiastic members, it was generally approved. The congress accomplished its main purpose of stimulating interest in the study and giving it an international character. Much was done in 1912, not only toward securing wide public discussion of eugenics but in removing wrong popular impressions arising either from misrepresentations or from the exaggerations of extremists. Important bodies which gave their attention to it in the United States during the year were the American Medico - Psychological Association, which favored strong measures for the prevention of insanity, the National Association for the Study of the Feeble-Minded, and the Association for the Study of Epilepsy. Prevention was the main theme of discussion and there was a general tendency to favor it. The subject of prevention was also discussed by the National Conference of Charities and Corrections in connection with the treatment of defectives. A school was opened in Boston for the practical instruction of parents and teachers in the subject of eugenics. See BIOLOGY, and SOCIOLOGY.

EVANGELICAL ASSOCIATION. A religious denomination which has its chief strength among the German-born citizens of the United States. In general, it has the doctrine and polity of American Methodism, but is modified in the direction of greater democracy. Communicants are found in nearly all parts of the northern section of the United States and Canada. There is a considerable strength also in the West and South. Missionary work is carried on among Italian immigrants. There were in 1912 109,506 communicants, 1665 churches, and 978 ministers. For administrative purposes there are twenty-four districts. In the Sunday schools there are about 175,000 pupils. The Young People's Alliance, connected with the church, numbers 50,000 members. A publishing house is maintained at Cleveland, O., and several philanthropic institutions and hospitals in Chicago, Philadelphia, and in cities throughout the Middle West. The chief educational institution is Northwestern College at Naperville, Ill.

EVANS, EDWARD C. An American clergyman, writer and educator, died October 23, 1912. He was born in Wrexham, North Wales, in 1844. In 1869 he removed to the United States and entering Princeton University, graduated in 1876. In the following year he was

Marquand Classical Fellow at Oxford University. He later studied at Princeton Theological Seminary and then accepted a professorship at Lake Forest University. From 1879 to 1882 he was pastor of the Welsh C. M. Church in Remsen, N. Y. He was well known as a preacher and writer. He received the degree of D. D. from Hamilton College in 1910.

EVANS, ROBLEY DUNGLISON. A rear-admiral, retired, of the United States navy, died January 3, 1912. He was born in Floyd county, Va., in 1846. After the death of his father in 1855 he went to live with his uncle, Alexander H. Evans, in Washington, D. C. He there attended Gonzaga College. In 1859 he was appointed to the United States Naval Academy and in the following year began his studies at Annapolis, graduating in 1863. He saw active service in the Civil War on the frigate *Powhatan* under Admiral Lardner and under the same officer in the East Gulf. Afterwards, under Admiral Porter, he participated in the assault upon and capture of Fort Fisher. He was severely wounded in the assault made by the defenders of the fort against their besiegers. After spending several months in the hospital he was, at his own request, restored to the active list. He was promoted by Congress for conspicuous gallantry and soon afterwards sailed for China on the *Delaware*, the flagship of Rear-Admiral Rowan. On his return to the United States he was assigned to ordnance duty until 1870, when he was stationed at Annapolis for two years. He was then sent to the Mediterranean as navigating officer of the *Shenandoah*. Upon the threatened outbreak of war between the United States and Spain in 1874, he returned and was appointed executive officer of the *Congress*. On this ship he returned to the Mediterranean and remained there until the *Congress* was sent to Philadelphia at the opening of the Centennial in 1876. In the years immediately following he served as commander of the training-ship and in the Washington Navy Yard and as a member of the first advisory board whose reports resulted in the foundation of the new navy. Upon his recommendation steel was adopted for the construction of United States battleships. He worked for a short time in the steel works at Pittsburgh, testing and inspecting steel. In 1891 he was assigned to the command of the *Yorktown* and was ordered to Valparaiso. Here an incident took place which won him the sobriquet "Fighting Bob." Previous to the entry of the *Yorktown* into the harbor of Valparaiso, a Chilean mob had assaulted the sailors of the cruiser *Baltimore*. This brought about a delicate diplomatic situation, especially as some Chilean refugees had taken shelter on board the *Yorktown*. The Chilean government was informed that the refugees would be protected on the *Yorktown* at all costs. Evans's gig was stoned by the Chileans; whereupon he demanded a suitable apology from the commander of the Chilean war vessel, a portion of whose crew had perpetrated the act, and supported the request by a notification that if the apology was not forthcoming within twenty-four hours the guns of the *Yorktown* would be trained upon the Chilean man-of-war. An apology immediately followed. Returning from Chile, Evans was sent to the Bering Sea to prevent unlawful sealing. At that time there was friction between Great Britain and the United States over the sealing industry and there was talk of pos-

sible war. Evans enforced his instructions so resolutely that of 108 vessels that had been warned against proceeding to the sealing grounds, 98 were prevented from violating the law. Practically no seals were killed in that year. In his five months' duty Evans sailed 63,000 miles. In 1893 he was made a captain and was given command of the cruiser *New York*. At the outbreak of the Spanish war in 1898 he was in command of the *Iowa*, which was part of Rear-Admiral Sampson's fleet, which shut Cervera up in the harbor of Santiago. In the battle which followed Cervera's dash for freedom, the *Iowa* took a prominent part and was largely instrumental in the destruction of the *Maria Teresa*, Cervera's flagship. The *Iowa* also engaged the *Vizcaya*, the *Cristobal Colon* and the *Oquendo*. When the *Vizcaya* was run aground Evans sent boats to rescue her crew and received her commander and other officers on board the *Iowa*. He always insisted that the credit of the victory belonged to Admiral Sampson. In 1901 he was made rear-admiral. He commanded the fleet in the Far East in 1904. In 1907 he was given the signal honor of commanding the great battleship fleet which left Hampton Roads, December 16, for its cruise around the world. When the fleet reached San Francisco, Admiral Evans retired from its command, chiefly as the result of ill health. He was retired August 18, 1908, after receiving the thanks of the Navy Department for the manner in which he handled the fleet. Admiral Evans wrote two books of reminiscences, and *A Sailor's Log* (1901).

EVERETT, WILLIAM HENRY. A rear-admiral, retired, of the United States navy, died June 10, 1912. He was born in New York in 1847 and graduated from the United States Naval Academy in 1868. In the following year he was made ensign. He was promoted through various grades until he became captain in 1904. In 1906 he was made rear-admiral and retired at his own request.

EVERGLADES. See EXPLORATION; FLORIDA, and DRAINAGE.

EWERS, EZRA PHILETUS. An American soldier, died January 16, 1912. He was born in Wayneport, N. Y., in 1837. He enlisted as a private in the 19th Infantry and was promoted to be first lieutenant in that regiment in 1864. In 1866 he was transferred to the 37th Infantry and in the same year was made captain. He served afterwards with the 5th Infantry and with the 9th Infantry. He was promoted to be lieutenant-colonel in 1897 and brigadier-general of volunteers in 1898. He was honorably discharged from the volunteer service in 1899 and in the same year was appointed colonel of the 10th United States Infantry. In 1901 he was retired by operation of law and was advanced to the rank of brigadier-general in 1904. He was brevetted for gallantry in action in the Civil War.

NORTH AMERICA. Dr. Carl Lumholtz has published the results of his studies in 1909 and 1910 of the economic possibilities of the arid and little-known country east of the Colorado River in southern Arizona and the Altar dis-

By courtesy of D. Appleton & Co.

ROBLEY D. EVANS
REAR-ADMIRAL, UNITED STATES NAVY

1900

trict of the State of Sonora, Mexico. Most of this region, he says, will remain suitable only for cattle- and horse-raising, but considerable areas can be brought under cultivation. He refers to the extensive valley south of the Mexican boundary running east and west and passing beyond Sonoyta, the great plains northeast and southeast of Pinacate, and most of the flat valleys where water may be found at depths of from fifty to several hundred feet and brought to the surface for irrigation. The western part of the region includes a great auriferous belt, stretching southward from California and Nevada. The extraordinary adaptation of plant and animal life to arid conditions is very interesting. The rainfall is only about three inches a year, but he saw no plant, bush or tree suffering from drought and the juicy pulp of the cacti is sufficient to quench thirst. He made a careful study of the Papago Indians, who speak a dialect of the Piman language.

In August the United States and Canada completed the delimitation of their boundary line along the 141st meridian from near Mt. St. Elias to the Arctic Ocean, 600 miles. The survey has been in progress for years and advanced slowly because the working season is very short, and the transportation of outfit and supplies is difficult. Mr. Henry G. Bryant, president of the Geographical Society of Philadelphia, spent three months in the summer exploring the St. Augustine River, which enters the Gulf of St. Lawrence in the Canadian Labrador. The course of this river was unknown before Mr. Bryant traced it to its source on the Height of Land 141 miles from the point where it enters the Gulf. His survey resulted in a good map of this important river. The party led by Prof. Herschell C. Parker ascended Mt. McKinley to an altitude of about 20,000 feet. They were only about 300 feet from the summit when a very hard storm compelled them to give up the attempt. The party mapped a large area and demonstrated the possibility of reaching the top of the mountain by the northern route. The region of the Everglades in south Florida has been almost unknown because the country is extremely difficult to penetrate, and many cypress swamps abound. Parts of this region are now being drained and many settlers are going there. Prof. Harshberger of the University of Pennsylvania visited the Everglades in the summer and studied their botanical features and economic prospects. Drainage canals will eventually reclaim this swampy region. The lands need only thorough drainage and the application of mineral fertilizers to produce large returns. A great variety of food crops thrive and new settlements are constantly starting. It will be long, however, before the vast area is entirely reclaimed. See FLORIDA.

AFRICA. Dr. D. T. MacDougal and Mr. Godfrey Sykes of the Desert Laboratory of the Carnegie Institution of Washington examined some features of Egyptian deserts in January-March to determine their most obvious biological and physical conditions. The main work was in the Libyan Desert following the railroad from the Nile to the Oasis of Kharga, thence by caravan to Dahkla, Farafra, and Baharia, returning to the Nile at Minia. Distances of forty miles were traversed without the sight of a single plant, dead or alive. Lizards, beetles, rodents, birds, and gazelles were seen in places far from water, and must have depended upon

the little moisture in their food. The quantity of water consumed by men and animals seemed to be less than that required in American deserts. More extended cultivation will in most cases depend upon engineering enterprise and efficiency in irrigation. The present size of the oases may be increased by a unified control of the water supply, and it is probable that exploratory borings might tap supplies that would help to form oases.

Italian topographers are at work preparing a map of Tripolitania, the country which Italy has acquired from Turkey. No authoritative map of this part of North Africa has existed, but the Italians intend to push the work of completely mapping the country. The Austrian-Uganda Expedition has ascended the extinct volcano Elgon. This famous mountain, about sixty miles northeast of Victoria Nyanza, was first brought to notice by the British explorer Joseph Thomson, who found on the lower slopes many artificial caves inhabited by natives. The crater lies between the two peaks of the mountain, the higher of which is 14,192 feet above the sea.

ASIA. The results of the exploration of the Kamchatka River, the largest river in the peninsula of that name, have been published in St. Petersburg. Mr. Lebedef says that the upper part of the river is swift and full of rapids. From the River Sheroma to Mashuri, about sixty miles, it is navigable in small boats, and the velocity is less than four miles an hour. Below Mashuri, the river is navigable for light draft barges to Nizhne-Kamclatsk. Below this point the stream is 200 yards wide and is navigable by vessels drawing not more than five feet of water. At its mouth the river is 360 yards wide, with a depth of eighteen feet and a discharge of about 30,400 cubic feet a second. The river is fed chiefly by melted snow and ice and only to a small extent by rivers.

The most important exploration recently carried on in Siberia is that of B. M. Shitkof in the Yalmal Peninsula between the Kara Sea and the Gulf of Ob, the interior of which had been almost unknown. He used twelve men and 480 reindeers in the work. The interior consists of slightly elevated tundras broken by the depression of the river valleys and lakes, which are very numerous. Conifers extend about to 67° N., beyond which are only dwarf willow and birch. Grass is found in some areas, and parts of the tundra are gay with flowers. Strong winds mark the spring months. The maxima and minima of temperature in May were +37.6° and -77° F.; in June, +28.4° and -78° F. The late ice reached a thickness of seven feet, but the snow cover on the level tundra was generally less than a foot deep. The Samoyedes on the peninsula own large herds of reindeer, but have been little influenced by civilization.

The expedition sent out by India in 1911 to punish the Abors who murdered English and Indian explorers was unable to follow the natives into their most remote mountain fastnesses; neither did the expedition entirely solve the problem of the identity of the Sangpo River of Tibet with the Dihong-Brahmaputra, as the expedition was unable to advance far enough north, though it explored a part of the hitherto unknown stretch of the river. There is no doubt, however, that the two rivers are identical. Several large, snowy peaks were discov-

ered on the main Himalayan Divide, including one very fine peak of over 25,000 feet.

AUSTRALASIA AND OCEANIA. The Hon. Miles Staniford Smith, administrator of the territory of Papua (British New Guinea), has carried out extensive explorations in the western part of the territory, embracing 54,000 square miles which have hitherto been almost unknown. Three-fourths of this region is drained by the Kikor River and its tributaries. It is an elevated plateau consisting of limestone beds, running up to the volcanic or the limestone rocks of the ranges, the whole plateau consisting of alternate ranges and valleys, making the country very rough. The rainfall is excessively heavy, much of it sinking into the limestone. Rivers disappear and come to the surface again on the other side of a range, so that there is a large system of underground drainage. The sparse population is not homogeneous, but seems to be a mixture of Papuan and Melanesian elements. The natives are settled in substantial buildings on their cultivated lands. They are cannibals and their weapons are the bow and arrow and spear. They largely employ the stone adze and ax in their work. The climate is cool and bracing, owing to the high elevation. Large bodies of good coal were found on the borders of the plateau.

About forty miles off the north coast of Mindanao, Philippine Islands, the German survey ship *Planet* found a depth of 32,078 feet, a new record in ocean depths. In other words, the depth where the sounding was taken is 6.07 miles, exceeding by 482 feet the greatest depth hitherto known. In 1901 the United States survey ship *Nero* made a sounding to the southeast of the Island of Guam of 31,596 feet, which beat the world's record for sea depths up to that time. The *Challenger* expedition originated the practice of designating all areas with a depth exceeding 18,000 feet as "deeps," and giving a distinctive name to each of them. Some fifty of these deeps are now known.

EXPOSITIONS. During the year no important expositions were held in the United States.

PUT-IN-BAY. The design by J. H. Friedlander, with whom is associated A. D. Seymour, Jr., of New York, was accepted by the commission having in charge the celebration of the centennial of Commodore Perry's victory on Lake Erie, to be held from July 4 to October 5, 1913. The design consists of a Doric column forty-five feet high, with a spectators' gallery and a light in the top. It is to stand on a plaza 525 feet long, the length of the neck of land at Put-in-Bay, already chosen as the proper site, and sixty feet wide. At one end of the plaza is to be a historical museum, and at the other a memorial building typifying the 100 years of peace with Great Britain. The celebration will include a naval display by the United States and Great Britain. It is planned to bring American and British gunboats, torpedo boats, and torpedo-boat destroyers through the Welland Canal to Lake Erie. For this purpose a temporary abrogation of the clause in the treaty of Ghent barring warships from the waters of the Great Lakes is being sought. The old *Niagara*, Perry's flagship, sunk in Erie harbor, is to be raised and made fit to participate.

SAN FRANCISCO. Material progress has been made in the preparations for the great Panama-

Pacific International Exposition to be held in San Francisco from February 20 to December 4, 1915, to celebrate the opening of the Panama Canal. The buildings will be "the loftiest and the most impressive ever constructed" and "the decorative plan will produce an artistic effect never surpassed." As viewed from San Francisco Bay, three main groups of exposition palaces will be seen rising against the amphitheatre of the hills. A central group with the Palace of Fine Arts on the west and Palace of Machinery on the east will extend 4500 feet east and west. Its towers, exclusive of the main tower in the Court of Honor, will rise 130 to 175 feet in height. The domes in the centre of the exhibit palaces will tower 144 feet. West of the central group will be the Palace of Fine Arts building and nearest the Golden Gate there will rise tier upon tier in terraces the palaces and pavilions of the foreign nations, while closer to the water will be the buildings of the States. The dominating theme of the exposition, from an architectural viewpoint, will be the huge tower of the Administration Building, 425 feet high, and flanked on either side by the gilded domes, towers, and minarets of other buildings. The prevailing color tone of the exposition, and there will be one throughout, will suggest a gold, although possibly it may be best described as a tawny buff, several shades removed from white. The domes will glisten with gold, and at night will be played upon by searchlights.

A "Commission Extraordinary to Europe," composed of John Hays Hammond, Gen. Clarence R. Edwards, Admiral Sidney A. Staunton, R. B. Hale, and W. T. Sisson, visited twenty-four countries in Europe for the purpose of interesting participation, and already a number of representatives of foreign governments have visited San Francisco for the purpose of selecting sites for special buildings. Many State commissions have also visited San Francisco for a similar purpose. Numerous conventions have already signified their intention of meeting in San Francisco in 1915. Other interesting features announced are that the Greeks of the United States will reproduce in white marble on Telegraph Hill, which overlooks San Francisco Bay and is adjacent to the exposition site, the famous Parthenon of Athens. The three caravels, reproductions of the Columbus vessels, now in Jackson Park, Chicago, are to be repaired and brought to San Francisco by the Knights of Columbus.

SAN DIEGO. (See YEAR BOOK, 1911, p. 247.) The Panama-California Exposition will be held in San Diego, Cal., from Jan. 1 to Dec. 31, 1915. Building operations were begun in December, 1911, and the Administration Building was completed in April, 1912. Designs for other buildings have been accepted and sites for many State and county buildings designated. Grading and improvement of the grounds is going on at a rapid rate. Thousands of trees and shrubs have been set out, including a citrus grove where seventeen varieties of these fruit trees have been placed, and an irrigation system has been installed. The entire site of 615 acres in Balboa Park has been enclosed with a woven wire fence eight feet high, and, in all, nearly three miles in length. This fence will be covered with vines and present the appearance of a wall of living

green. It is planned to have all the buildings completed by January 1, 1914, in order that the floral features may have an entire year for their development.

An international conference of manufacturers and merchants representing twenty-six governments was held in Berlin on October 7 to discuss an international agreement as to measures which should be taken in future to regulate and control international exhibitions. The limitation of the number of exhibitions, rules for the awarding of medals, and the publication of an international code of regulations were considered. Subsequent to the Franco-British Exhibition held in London in 1908 and the Japanese-British Exhibition held in 1910, statistics show that trade relations between the countries mentioned were substantially stimulated, British exports increasing largely.

JAPAN. In March announcement was made on the authority of the vice-minister of agriculture and commerce of Japan that the purpose of holding an international world's fair in Tokyo in 1917 had been altogether abandoned.

HOLLAND. The centenary of Holland's liberation from the French will be observed during 1913 by a series of special exhibitions and centenary celebrations to be held in many cities and towns throughout Holland. Amsterdam will have a "nautical exhibition." At Leeuwarden an exhibition of Frisian art is being organized. Middelburg's exhibition will show Dutch costumes, together with Dutch furniture and art objects. Utrecht is to have an exhibition of the early Netherland school of painting; while Zaltbommel's exhibit will be of Delft ware. Nijmegen is to show Roman antiquities excavated there, and at Muiden, near Amsterdam, is to be shown an ancient Dutch castle. Monnikendam's contribution will be a "Waterlandisch Huis."

BELGIUM. A universal and international exposition similar to those held in Antwerp (1894), Brussels (1910), and Liège (1905) will be opened in Ghent on April 27 and continued till November 15, 1913. A site covering 260 acres has been selected and the buildings are in an advanced state of completion. Germany, France, Great Britain, including Canada, New Zealand, and India, Argentina, Brazil, Chile, Peru, China, and Japan have engaged space.

NORWAY. A national exposition will be held in Christiania from May 15 till September 30, 1914, to celebrate the centenary of Norway's adoption of its constitution on May 17, 1814. The scope of the exposition will be large, but exhibitions will be restricted to citizens of Norway.

INTERNATIONAL CONGRESSES. Among the important international congresses held in the United States during the year were: The Waterways Congress, Philadelphia, May 23-28; Eighth International Congress of Applied Chemistry, Washington, September 4, and New York, September 6-13; conferences in connection with the Third International Rubber and Allied Trades Exposition, New York, September 23-October 3; Fifteenth International Congress on Hygiene and Demography, Washington, September 23-28; and International Congress of Chambers of Commerce, September 24-28.

FAIRBAIRN, ANDREW MARTIN. An English scholar and educator, died February 9, 1912. He was born in 1838 near Edinburgh, and was educated at the universities of Edinburgh and Berlin, and at the Evangelical Union Theological Academy, Glasgow. He spent the first forty years of his life in Scotland, for twelve years as minister of the parish at Bathgate near Edinburgh. During this time he devoted himself to the study of theology. From 1872 to 1877 he was pastor of the Congregational Church in Aberdeen, and from 1877 to 1886 was principal of Airedale College. He developed a remarkable capacity for organization which manifested itself in the part which he took in the foundation and development of Mansfield College, a non-residential college at Oxford, which was designed not only to train students for the ministry in the Congregational and other Free Church bodies, but to be the centre of Free Church life in the University. After persistent efforts this college was founded in 1886, with Fairbairn as its principal. As the result of his efforts the college became at once a success. With its chapel open to all members of the university it became the centre of University Free Church life. Its theological students are either connected with the ordinary colleges or are attached to the university through the non-collegiate body. Dr. Fairbairn remained the principal from 1886 to 1909, when he was made principal emeritus. In addition to his work as minister and principal, he was from 1878 to 1882 Muir lecturer at the University of Edinburgh; from 1892 to 1894 Gifford lecturer at the University of Aberdeen; and from 1891 to 1892 was Lyman Beecher lecturer at Yale University. In 1898-9 he went to India and delivered the Haskell lectures. He was a member of many of the governing bodies of theological institutions in Scotland and Wales. He was one of the most eminent theologians of his day. Among his published writings are: *Studies in the Philosophy of Religion and History* (1876); *Studies in the Life of Christ* (1881); *The City of God* (1882); *Religion in History and in Modern Life* (1884); *Christ in Modern Theology* (1893); *Christ in the Centuries* (1893); *Catholicism, Roman and Anglican* (1899); *The Philosophy of the Christian Religion* (1902); *Studies in Religion and Theology*; *The Church in Idea and in History*.

FALKLAND ISLANDS. A British colony, composed of a group of islands in the south Atlantic. They are East Falkland (3000 sq. miles), West Falkland (2300) and about 100 smaller islands (about 1200). Population (1911), 2272 (1371 males, 901 females); with South Georgia, 3275 (2370 males, 905 females); population per square mile, 0.3. Stanley (800 inhabitants) is the only town. Sheep-farming is the sole industry, and the exports are wool, hides and skins, horns, hoofs, and live sheep. In 1911 there were about 3300 horses, 6000 cattle, 706,170 sheep, 100 swine. The 1910 imports were valued at £94,294, and the exports at £308,930. Shipping entered and cleared, 325,583 tons. Revenue, £26,773; expenditure, £17,405. There are no roads outside the town limits. W. L. Allardye was governor in 1912.

SOUTH GEORGIA is a dependency of the Falkland Islands. It is a group of islands aggregating 1000 sq. miles, and is the headquarters for seven whaling stations, whose output of oil for the season ending March 31, 1911, was upwards of 150,000 barrels. Other dependencies are the **SOUTH ORKNEYS** and the **SANDWICH** group.

FARLEY, JOSEPH PEARSON. An American soldier, died April 6, 1912. He was born in Washington, D. C., in 1839, and graduated from the United States Military Academy in 1861. He served throughout the Civil War, rising to the rank of captain. In the years following the war he was promoted through various grades until he was made major-general in 1903. In the same year he was retired after forty years of service. From 1865 to 1867 he was assistant professor of drawing at West Point. He was a member of various statutory boards, ordnance boards, and gun-testing boards. He was the author of *West Point in the Early 60's* (1902), and *Three Rivers: A Retrospect of War and Peace* (1910). He contributed articles on arms and explosives to technical journals.

FARNSWORTH, WILSON AMOS. An American missionary, died June 5, 1912. He was born in Greene, N. Y., in 1822, and graduated from Middlebury College in 1848. In 1852 he graduated from Andover Theological Seminary and was ordained to the Congregational ministry in the same year. He was a missionary of the American Board in Asia Minor for more than fifty years and at the time of his death was the oldest missionary on the board.

FEDERAL EMPLOYERS' LIABILITY ACT, CONSTITUTIONALITY OF. See **EMPLOYERS' LIABILITY.**

FEDERATED MALAY STATES, THE. A British protectorate composed of four states in the Malay Peninsula, as follows (import and export values in Straits Settlements dollars):

	Area Sq. miles	Pop. 1911	Imps. 1910	Exps. 1910
Perak	7,900	494,123	21,784,361	44,084,758
Selangor	3,200	294,014	24,315,540	46,732,071
Negri Semb. .	2,600	130,201	870,477	7,978,071
Pahang	14,000	117,933	2,140,973	4,048,025
Total	27,700	1,036,271	49,111,351	102,840,990

The total length of the Federated Malay States railways in operation is 537 miles—23 in Province Wellesley (see Penang), 205½ in Perak, 102 in Selangor, 154 in the Negri Sembilan, 31 in Pahang, and 21 in Malacca (qq.v.). In addition the F. M. S. Railways Co. operates 120½ miles of line in Johore.

The total revenue in 1910 amounted to 26,553,018 dollars; the expenditures to 23,598,610 (1 Straits Settlements dollar = \$0.56776).

In 1909 a federal council was created by an agreement between the high commissioner and the four native rulers, to consist of the high commissioner as president, the chief secretary, the sultans of Perak, Selangor, and Pahang, the yam tuan of the Negri Sembilan, the four British residents, and four unofficial members nominated by the high commissioner. The first meeting was held December 11, 1909, at Kuala

Kangsar. Kuala Lumpur is the administrative headquarters.

The high commissioner in 1912 was Sir Arthur Young (governor of the Straits Settlements), and the chief secretary, E. L. Brockman. See **PERAK, SELANGOR, NEGRI SEMBILAN, PAHANG.**

FEMALE POPULATION IN THE UNITED STATES. See **SEX DISTRIBUTION.**

FENCING. The nineteenth annual inter-collegiate tournament was won by the United States Military Academy. The United States Naval Academy finished second and Cornell, the winner in 1911, third. The standing of the various teams entered was: U. S. Military Academy won 41 bouts, lost 4; U. S. Naval Academy won 29, lost 16; Cornell won 28, lost 17; Harvard won 17, lost 28; Columbia won 11, lost 34; Pennsylvania won 9, lost 36. The individual championship went to H. A. Raynor of the U. S. Military Academy, who won 15 straight bouts. In dual matches the U. S. Military Academy defeated Yale 7—2, Cornell 6—3, and Columbia 8—1; the U. S. Naval Academy defeated Harvard 5—4, Pennsylvania 7—2, Columbia 7—2, and Yale 8—1; Pennsylvania defeated Harvard 5—4, Columbia 7—2 and 5—4, Yale 5—4, and Princeton 5½—3½; Cornell defeated Columbia 6—3; Yale defeated Harvard 6—3; Harvard defeated Columbia 6—3; Williams defeated Springfield Training School 8—1.

In the national championships held by the Amateur Fencers' League, S. Hall of the Fencers' Club of New York won with the foils, A. Z. V. Post of the same club, with the duelling swords, and C. A. Bill of the New York A. C., with the sabres. The women's championship with the foils was won by Miss Adelaide Baylis of New York City. The foils team championship was captured by the Fencers' Club of New York, which defeated the Boston A. A. in the final round by 5 bouts to 2. The New York A. C. won the sabre team championship, the Fencers' Club finishing second. An international tournament was held at Ostend, France, in July. A summary follows: Foil teams—France first, Belgium second, Great Britain third; sabre teams—Belgium first, France second, Italy third. See **OLYMPIC GAMES.**

FERTILITY. See **SOILS.**

FERTILIZERS. There was great activity during 1912 along many lines bearing on the fertilizer industry, but more especially in the extension of the manufacture and use of fertilizers and in the development of new sources of fertilizing materials.

EXTENSION OF THE USE OF FERTILIZERS. There is not only a steady growth in the use of fertilizers in regions which have hitherto extensively employed them, but there is a rapid extension of their use to regions which have heretofore used them to only a limited extent or not at all. Russia trebled its use of fertilizers in the five years, 1907 to 1911. Its consumption of fertilizers (largely imported) was, however, only 362,600 tons in 1911, or about one-fortieth of that of Germany per acre of cultivated land. Australia doubled its consumption of fertilizers in the nine years ending with 1910, in which 290,000 tons are re-

ported to have been used. Spain, generally considered backward agriculturally, is now increasing its manufacture and use of commercial fertilizers, but more particularly in the intensively cultivated orange-growing regions of Valencia. Japan and China, although furnishing the most notable examples in the world of the maintenance of high productiveness of the soil without resource to commercial fertilizers, show an increase in recent years in the use of fertilizers, which, however, is still small in the case of China, but has reached relatively large proportions in Japan, 10 per cent. (in value) of the total imports of the latter in 1911 being fertilizers, mainly bean cakes, nitrate of soda, sulphate of ammonia, and rock phosphate. Under governmental encouragement and instruction the use of fertilizers is steadily increasing in Denmark, Hungary, South Africa, and the Philippines. The use of fertilizers, especially on sugar plantations, is already large in Hawaii, Java, and Cuba and is increasing each year. The manufacture of fertilizers in England and western European countries has for many years been large and is steadily growing to meet increasing home consumption and export. Increase in the use of fertilizers, coincident with improvement of methods of farming, has been especially rapid in the United States during the last ten years. The late wet spring of 1912 caused a falling off in the consumption of fertilizers in the Southern States, but it is probable that this was only a local and temporary setback and that the complete statistics for the year (not now available) will show a substantial increase in both production and consumption of fertilizers in the United States for the year.

The production and consumption of the raw materials supplying nitrogen, phosphoric acid, and potash furnish an index of the progress in the fertilizer industry.

Nitrogen. There is no evidence of a falling off in the world's production and consumption of the principal sources of nitrogen in fertilizers, namely, nitrate of soda. The imports into the United States apparently declined in 1912, but this was probably due to excess of supply held over from the previous year and an increase in production and consumption of sulphate of ammonia. The world's consumption of nitrate of soda is stated to have been 2,624,000 short tons in 1911, one-half to three-fourths of which was used as fertilizer.

The world's consumption of sulphate of ammonia (used mainly as fertilizer) was 451,000 tons in 1900, and 1,155,000 tons in 1911, Germany being the greatest producer (440,000 tons), as well as consumer (418,000 tons). The United States stands next to Germany in consumption (212,300 tons). There was a sharp decline in imports by the United States of sulphate of ammonia in 1911 and 1912, due to increased domestic production.

It is estimated that the synthetic processes of preparing nitrogen compounds from the air produced 27,500 tons of Norwegian calcium nitrate and 85,900 tons of calcium cyanamid in 1911. This by no means represents the capacity of the factories already erected, in course of construction, or planned. With the improvement of synthetic processes constantly going on, the erection of new factories abroad and in this country for the manufacture of the synthetic compounds, and the improvement of tech-

nic and extension of mining of Chilean nitrate, an abundant future supply of nitrogen fertilizers at a reduced price seems assured.

PHOSPHATES. The world's consumption of phosphates in 1911 was 6,235,000 tons, of which America, the greatest consumer as well as producer, used 1,817,000 tons. These phosphates were used almost exclusively in the manufacture of superphosphates, of which the world's production in 1911 was 10,565,000 tons. The two great centres of phosphate mining are the United States, which marketed 3,418,672 short tons in 1911, and Tunis, which produced 1,415,000 tons in that year.

POTASH. The mining of potash salts has been especially active since the new German potash law went into effect. Nearly 11,000,000 tons of potash salts of various kinds were mined in 1911. This represents a large increase over the production in 1910. It is estimated that the world's consumption of actual potash (K_2O) for strictly agricultural purposes was about 935,000 tons in 1911. The greatest consumer, Germany, used 464,565 tons, the United States standing next with a consumption of 261,337 tons. The largest consumer of potash per acre of cultivated land is Holland, followed in order by Germany, Belgium, the United States, and France.

DEVELOPMENT OF NEW FERTILIZER RESOURCES. There was continued activity in this line during 1912. The result of investigations by the United States Bureau of Soils, coöperating with the United States Geological Survey, showed an extension of the already enormous deposits of phosphates in the United States and the possibilities of production of potash from the Pacific Coast kelps. Dry kelps were found to contain from 20 to 30 per cent. of potash (calculated as chlorid) and 0.15 to 0.3 per cent. of iodine. Commercial success in obtaining potash from this source depends upon the cheapening of methods of harvesting the kelp and extracting the potash and iodine. Various silicates of potash have been shown to occur in great abundance in the United States and elsewhere, but it has been demonstrated that these silicates, especially the feldspars, are poor sources of potash fertilizer in untreated condition, and the commercial success of methods of treatment to extract the potash or to convert it into more ready available forms has not yet been demonstrated, although the prospect of success in this direction is good. Potash salts of commercial value were found in the basin of Searles Lake and a company has been formed to exploit the deposit. Other possible sources of potash were explored without success. No nitrate deposits of commercial value have yet been found in the United States.

In Europe there was renewed activity in development of the Galician potash deposits, and borings for potash were made in the region of Belpport on the French frontier nearest the great German deposits with the hope of discovering a continuation of those deposits in French territory.

SCIENTIFIC INVESTIGATIONS. The more strictly scientific investigations relating to fertilizers resulted in no especially striking discoveries in 1912, but tended to emphasize certain facts of far-reaching importance, namely, that many substances, for example, sulphur, manganese, iron, boron, etc. (the so-called catalytic fertilizers of Bertrand and others) as

well as lime and magnesia, play a more important rôle in the nutrition of plants than has heretofore been assigned them, and that very small variations in the proportion of the fertilizing constituents may modify profoundly the nutritive value of the soil solution; i. e., it is necessary for normal plant growth to maintain a certain balance of these constituents (the so-called law of physiological ratios of Mazé). That very small amounts of fertilizing constituents may have a very great influence upon the growth of plants is shown by the recent work of the United States Bureau of Soils with certain organic constituents occurring in minute amounts in the soil, and by the experiments of Hiltner and others showing that spraying or painting small amounts of substances on the leaves of plants may affect their growth as much as the addition of larger amounts to the soil.

LITERATURE. The literature bearing on fertilizers issued during 1912 was large. Many valuable papers dealing with the chemical phases of the subject were presented at the Eighth International Congress of Applied Chemistry at New York. A review of progress in the fertilizer industry by G. Wichern appeared in *Chemiker Zeitung*, 36 (1912), Nos. 37, 39, 43, 46, 47, 51, 52. An exhaustive report by United States Consul T. H. Norton on the utilization of atmospheric nitrogen was published as Bulletin 52, United States Department of Commerce and Labor, Bureau of Manufactures, Special Agent Series. *The American Fertilizer Handbook* for 1912 contained as in previous years a large amount of useful information about fertilizers and the fertilizer business. The more important treatises on the subject were: L. L. Van Slyke, *Fertilizers and Crops*; J. E. Halligan, *Soil Fertility and Fertilizers*; A. C. Stillwell, *A Chapter on Fertilizers*; A. Rogers and A. B. Amber, *On Industrial Chemistry*, and E. and M. Lambert, *Annuaire Statistique des Engrais et Produits Chimiques destinés à l'agriculture*.

FESTIVALS. See MUSIC.

FETTEROLF, ADAM H. An American educator, died December 2, 1912. He was born at Perkiomen, Pa., in 1841, and was educated at Freeland Seminary, now Ursinus College. When he was twenty years of age he was chosen professor of mathematics in this institution. Five years later he was made its president, and purchasing the interest of the owner became proprietor. Five years later he sold the seminary to Ursinus College. He then removed to Bucks county, Pa., where he became one of the owners and president of Andalusia College. He continued in this post until 1880, when he was elected president of Girard College, Philadelphia. He received the degrees of LL. D. from Lafayette College and Ph. D. from Delaware College. He was a member of several learned societies.

FIFE, DUKE OF (WILLIAM GEORGE DUFF). Brother-in-law of King George V.; died January 29, 1912. He was born November 10, 1849, the only son of James, fifth Earl of Fife, and Lady Agnes Hay, daughter of the

Earl of Erroll. At his birth he inherited the titles of Baron Braca and Viscount Macduff. He was known under the latter title until the death of his father, Earl of Fife. He was educated at Eton, where he remained from 1863 to 1866. As Viscount Macduff he was elected to Parliament for the division of Moray and Nairn in 1874, serving until 1879, when through his father's death he became Earl of Fife in the peerage of Ireland and Baron Skene in the peerage of the United Kingdom. From 1872 to 1902 he was lord-lieutenant of the county of Elgin. In 1882 he served on a special mission to the King of Saxony. In 1885 he was created Earl of Fife in the United Kingdom. He showed strong instincts for business and was associated with others in banking and other financial enterprises which were successful. Among these was the foundation of the Chartered Company of South Africa, of which he was one of the founders and vice-president. After the Jameson Raid in 1896 he resigned his seat on the board of this company. From his early youth Viscount Macduff enjoyed the personal friendship of the Prince of Wales, afterwards King Edward VII. It was, however, with general surprise that the announcement was received in 1889 of the betrothal of the Prince of Wales's eldest daughter, Princess Louise, to the Earl of Fife. The marriage received the approval of Queen Victoria and was solemnized in St. James's Palace on July 27, 1889. The Earl of Fife was immediately elevated to the dignity of Duke of Fife and Marquis of Macduff in the United Kingdom. As a result of the delicate health of Princess Louise, which prevented her appearing in public to a great extent, the Duke of Fife himself was less known than otherwise would have been the case. In addition to being the director in several banks, he was a keen supporter of the Volunteer movement. In 1900 he was made lord-lieutenant of the newly created County of London and in that capacity became president of the County of London Territorial Force Association. The death of the Duke of Fife was the direct result of the wreck, on December 13, 1911, of the steamship *Delhi*, on which he, with the Princess Royal and their daughters, was traveling to Egypt. The vessel ran ashore about three miles south of Cape Sparte. Through the assistance of French sailors the passengers were safely landed, but only after great hardships. After his arrival in Egypt the Duke fell ill and died. He left two daughters, Princess Alexandra, born May 17, 1891, and Princess Maud, born April 3, 1893.

FIJI ISLANDS. A group of south Pacific islands; a British crown colony. The principal inhabited islands are Viti Levu (4112 sq. miles), Vanua Levu (2432), Taviuni (217), Kadavu (124), Koro (58), Gau (45), and Ovalau (43). Total area, including the dependency of Rotumah (14), is 7435 sq. miles; total population (1911) 139,541 (80,008 males, 59,533 females), of whom 87,096 Fijians, 40,286 (26,073 males) Indians, 3707 Europeans. The Indian immigrant population (sugar-plantation laborers) is over 40,000. Sugar, copra, and fruit (particularly pineapples) are the chief products and exports. Total imports (1910), £870,120; exports, £1,005,818 (sugar, £669,432; copra, £258,914; fruit, £47,301). There is no railway. Suva, the capital, has cable communication with Brisbane and with Canada.

Revenue, £211,952; expenditure, £236,861. Public debt, £104,115. Sir Henry May was governor in 1912.

FILCHNER, DR. See POLAR EXPLORATION.

FILTRATION. See WATER PURIFICATION.

FINANCIAL REVIEW. The following article gives a general summary of business conditions during the year. Other articles related to topics here discussed are the following: **BANKS AND BANKING; NATIONAL BANKS; STATE BANKS; LOAN AND TRUST COMPANIES; SAVINGS BANKS; POSTAL SAVINGS BANKS; PRICES; TARIFF; TRUSTS; INSURANCE; UNITED STATES STEEL CORPORATION; AGRICULTURAL CREDIT.** See also **LABOR** and various articles there referred to.

GENERAL BUSINESS CONDITIONS. Recent financial history really begins with the recovery during the latter part of 1908 and all of 1909 from the serious panic and industrial depression beginning in October, 1907. Recovery was checked during 1910 and the year 1911 was one of only moderate business prosperity. In comparison therewith the year 1912 was a year of notable industrial and commercial activity. Even during the first half of the year before the bountiful crops were assured a strong optimistic tone prevailed, and during the second half this continued, although money became relatively scarce and dear. The year was at the same time notable for great political excitement during the early months and a pronounced political change in the November election. But the business world, contrary to all precedent, viewed these political changes calmly and appeared indifferent to probable tariff changes. The agricultural production of the year established new high records and constituted a firm basis for confidence in the general situation. It was \$9,532,000,000, an increase of 13.24 per cent. over 1911. The farm value of corn exceeded a billion and a half dollars; the total value of winter and spring wheat exceeded half a billion; and that of oats approached half a billion. The crops of barley, potatoes, rye, and hay were the largest in our history. The cotton crop was exceeded only by that of 1911 in amount, its value including cotton seed, \$986,920,000, exceeding all other years. The iron and steel industry likewise achieved an unprecedented volume. The iron ore shipments from Lake Superior exceeded 48,000,000 tons, which was nearly 50 per cent. in excess of those of 1911 and about 5,000,000 tons above the record of 1910. Eleven new blast furnaces with 1,200,000 tons annual capacity were started and seven more with 900,000 tons were under construction. Moreover, there was an addition of more than 3,000,000 tons of annual capacity to the open hearth steel mills under construction at the close of the year. The number of unfilled orders on the books of the United States Steel Corporation increased from 5,379,000 tons in January to 7,852,000 tons in November, in spite of nearly capacity production. Other companies also had an unprecedented number of orders, some having contracted to the limit of their capacity even for the second half of 1913. The total pig iron production was about 29,500,000 tons, rising from 2,057,911 tons in January to 2,689,933 tons for October, and 2,630,850 tons for November; the October record was the largest monthly record yet made. Building operations exceeded those of 1911 by about 6.6 per cent. Bank

clearings showed an increase of 9 per cent. over 1911, and exceeded the previous maximum made in 1909 by nearly 5 per cent. In foreign trade both imports and exports exceeded those of all previous years. Imports totaled \$1,800,000,000 or about \$240,000,000 in excess of the previous record made in 1910; exports totaled \$2,400,000,000 or \$300,000,000 more than the previous maximum reached in 1911. Immigration which has come to be an index of business prosperity was 567,110 in the first ten months, or nearly 80 per cent. more than in the same period of 1911. The year was not a good one from the stock exchange viewpoint. In the early months prices were low and the market was dull; later, prices rose and activity increased only to be badly disturbed by the Balkan War, which led to European liquidation of American securities and a consequent lack of expected gold imports. Prices of securities fell further following the decision of the Supreme Court in the Union Pacific-Southern Pacific case (see **TRUSTS**). Banks on the other hand experienced great prosperity. Railway traffic was enormous, especially in October and November, when car shortage was extensive. Railway earnings surpassed all previous records and the roads in turn bought more freely of rails and rolling stock. Gross receipts increased about 8 per cent. over 1911, and net earnings about 5 per cent. Freight cars built numbered 152,429, or more than double the number built in 1911 and slightly exceeding the ten-year average. Locomotives built numbered 4915, of which 512 were for export. The total was more than in any year since 1907. New railway construction, however, was only 2997 miles, or the least for any of the past 14 years. Textile manufacturers experienced a moderate degree of prosperity in spite of very unusual labor disturbances and extensive agitation for the reduction of the cotton and wool tariff schedules. (See **TARIFF**.) Prices of commodities continued to advance, reaching a level at least 50 per cent. above that of 1896. This tended to reduce profits; the upward movement, however, was checked somewhat by abundant crops promising cheaper food. Wages also advanced, but from many quarters came the complaint that labor was scarce.

According to the *New York Journal of Commerce* dividend and interest payments for January, 1913, would make an entirely new record. It estimated dividend payments to total \$100,215,822, distributed as follows: Railroads, \$33,953,800; industrials, \$49,288,183; street railways, \$8,509,839; and bank and trust companies, \$8,500,000. Interest payments were estimated to aggregate \$144,012,678, distributed as follows: Railroads, \$99,300,000; industrials, \$25,200,000; street railways, \$6,800,000; government, \$3,247,678; and Greater New York, \$9,465,000. The grand total of \$244,264,500 was 7.6 per cent. greater than similar disbursements January, 1912. The increase was due in part to the large issues of bonds and notes during the year by railroad and industrial organizations and in part to increased earnings due to higher prices.

STATISTICS. In the accompanying table are noted some of the more important statistical items for the United States in 1912, with the percentage of change from 1911; the percentage of increase and decrease being shown by plus and minus signs respectively.

Corn	\$1,520,454,000	- 2.9
Winter Wheat	323,572,000	-14.6
Spring Wheat	231,708,000	+41.3
Total Wheat	555,280,000	+ 2.2
Oats	452,469,000	+ 9.1
Barley	112,957,000	-18.8
Rye	23,636,000	-14.1
Buckwheat	12,720,000	- .1
Total six cereals.....	\$2,677,516,000	- .9
Flaxseed	\$32,202,000	- 8.7
Potatoes	212,550,000	- 9.0
Hay	856,695,000	+ 9.1
Tobacco	104,063,000	+22.0
Rice	23,423,000	+28.0
Cotton, including seed.....	960,000,000	+ 2.4
Total above	\$4,866,449,000	+ 1.4
Bank clearings.....	\$172,276,149,104	+ 9.0
Imports of merchandise (estimated)	\$1,817,000,000	+18.6
Exports of merchandise (estimated)	\$2,425,000,000	+15.9
Total trade (estimated)....	\$4,242,000,000	+17.0
Circulation December 1.....	\$3,337,277,820	+ 2.0
Building expenditure	\$900,000,000	+ 6.0
New York stock sales.....	131,050,000	+ 3.5
New York bond sales.....	\$677,000,000	-23.8
Business failures, number..	13,832	+ 9.3
Failure liabilities	\$197,995,457	+ 5.2
Railways built, miles.....	2,997	- 2.2
Railway receiverships, miles	4,001	+46.0
Railway foreclosures, miles.	661	-52.0
Pig-iron, output, tons.....	29,240,000	+23.7
Iron-ore shipments, tons.....	48,000,000	+46.0
Total coal product, tons....	540,000,000	+10.0
Anthracite shipments, tons...	64,000,000	- 8.5
Labor strikers	475,000	+89.0
Gold produced, value.....	\$91,685,168	- 5.3
Silver produced, ounces.....	62,369,974	+ 3.2

STOCK EXCHANGE. On the whole the year was considered a bad one by stock brokers. Although there was a considerable accumulation of banking funds in reserve centres in the early months a general lethargy prevailed reflecting the conservatism of the business world. With the prospect of abundant crops and the great increase in foreign trade resulting in high probability of gold importation from Europe, greatly increased activity was shown in April and May. This was followed, however, by a dull stock exchange summer but with rising prices in September. This upward movement was checked by the outbreak of the Balkan War and the panicky conditions into which the European exchanges were thrown. American stocks and bonds held abroad were unloaded to an amount estimated at \$50,000,000 or more; this caused total stock transactions for October to exceed those of other months, except March and April, but resulted in sharp declines in values. Following Democratic success at the polls an outburst of activity advanced prices by 2 to 4 points. But in December the dissolution of the Union Pacific merger resulted in heavy liquidation; this was followed by slight recovery. During the later months the discount rate was 6 per cent. and the call loan rate very sensitive, going as high as 20 per cent. The total transactions on the New York stock exchange were 131,051,000 shares of stock and \$677,354,000 of bonds. The stock transactions were the smallest in number since 1908 with the exception of 1911.

STOCK HOLDINGS. An inquiry made in November brought out some interesting statistics as to the distribution of the securities listed on the New York, Boston, Chicago, Philadelphia, Baltimore, and Washington stock exchanges. Leading companies whose stocks were

not listed were also canvassed. Two hundred and seventy-four companies with aggregate capital of \$8,098,000,000 reported a total of 861,729 stock holders, having an average holding of \$9393. There were included 48 railroads with \$3,482,000,000 aggregate capital and 274,000 stock holders; 95 industrial companies with \$2,983,000,000 capital and 374,000 stock holders; 99 public utility companies with \$1,091,000,000 capital and 109,000 stock holders; 21 mining companies with \$305,000,000 capital and 59,500 stock holders; and 11 oil companies with \$236,448,000 capital and 44,500 stock holders. The number of women stock holders was shown to be increasing; 193 of the above companies with 385,000 stock holders reported 156,800 women stock holders. In addition the Pennsylvania Railroad had 35,846 women stock holders. The total number of stock holders was the largest in the Pennsylvania Railroad, 74,541; and in the Steel Corporation, 104,822.

Statistics bearing on foreign holdings of American securities were secured. They showed that American railroad securities are decreasing in favor and American industrials are increasing. Between 1900 and 1912 there was a decline in the proportion of the securities of reporting roads held abroad from 34.5 per cent. to 13.1 per cent.; even the total amount of foreign holdings had declined in spite of great additions to the capital of the roads involved. Companies with aggregate capital of \$5,311,000,000 reported that 9.6 per cent of their securities were held abroad. The percentage for railroads was 13.8; for industrials 8.8; for public utilities 3.4; for mining companies 6.2; and for oil companies 1.7. English investors had 63.6 per cent. of all foreign holdings; French 6.1 per cent.; German 8.5 per cent.; and Dutch 18.6 per cent. The statistics showed that between 20 and 25 per cent. of the capital of American corporations whose stocks are active in the markets were held by brokers in speculative accounts. Such holdings were much less than a decade ago.

BUILDINGS. The amount of building expenditures in 1912 of all cities, as reported by *Bradstreet's*, was \$908,000,000, a gain of 6.8 per cent. over 1911. On the basis of the same cities the total was greater than in any preceding year, except 1909. The approximation to the 1909 record was due to cities outside of New York; in the latter the expenditures exceeded those of 1911 by 15 per cent. and those of 1910 by 7 per cent., but were 17 per cent. less than those of 1909. The month of December showed more than normal activity on account of mild open weather, the total for that month exceeded that of December, 1911, by 32 per cent. in 126 cities. The largest monthly record yet made was that of April, 1912, when \$99,561,000 of building expenditures were recorded.

BANK CLEARINGS. The amount of bank clearings is considered an indication of the volume of business. By this test the year 1912 was a year of unprecedented trade. Nearly all the principal cities showed increases over preceding years, most of them, excepting New York, showing totals never before reached. These totals were explained by the large crops, the enlargement of pay rolls through increased wages and greater numbers of employees, the increased readiness to pay obligations, and the splendid volume of demand for goods. Of 122 cities with total clearing of \$172,376,000,000, according to *Bradstreet's*, only ten showed totals

smaller than in 1911. Moreover, each month, except June, showed larger clearings than the corresponding months of the preceding year. The total for 1912 exceeded that of 1911 by 9 per cent.; that of 1910 by 6.8 per cent.; and that of 1909, the previous maximum, by 4.8 per cent. The clearings by months in millions of dollars were as follows: January, \$14,965; February, \$12,771; March, \$14,319; April, \$14,837; May, \$14,701; June, \$13,508; July, \$13,836; August, \$13,088; September, \$12,940; October, \$16,987; November, \$15,211; and December, \$15,201. The clearings for October surpassed all previous monthly records; as did also those for the fourth quarter. The total clearings for New York were \$100,744,000,000, or about 60 per cent. of the total. Those of some other cities were: Chicago, \$15,380,795,541; Boston, \$8,962,808,530; Philadelphia, \$8,166,286,613; St. Louis, \$4,027,580,800; Pittsburgh, \$2,798,990,214; Kansas City, \$2,713,027,916; San Francisco, \$2,677,561,952; Baltimore, \$1,957,475,681; Cincinnati, \$1,369,215,000; Minneapolis, \$1,182,232,466; Los Angeles, \$1,168,941,700; Cleveland, \$1,150,397,652; Detroit, \$1,127,975,160; New Orleans, \$1,058,354,962; Omaha, \$860,681,557; Louisville, \$724,894,243; Milwaukee, \$724,683,441; Atlanta, \$691,941,254; Seattle, \$602,430,660; Portland, Ore., \$597,087,865; St. Paul, \$579,160,753; Buffalo, \$579,088,538; Denver, \$487,848,305; Providence, \$442,694,200; Indianapolis, \$434,525,978; Richmond, \$429,787,122; Memphis, \$421,302,287; Washington, D. C., \$391,776,791; Fort Worth, \$386,933,076; St. Joseph, \$383,062,742; Salt Lake City, \$369,452,285; Columbus, \$322,964,400; Albany, \$314,379,325; and Nashville, \$308,279,450.

CANADA. The total clearings for sixteen Canadian cities were \$9,010,000,000, or 22.6 per cent. increase over 1911. The clearings were at the minimum of \$602,000 in February, rising to over \$800,000 in May, falling to \$698,000 in September, but rising again to \$866,000 in October and \$876,000 in November. The clearings for principal cities were as follows: Montreal, \$2,845,000,000; Toronto, \$2,170,000,000; Winnipeg, \$1,537,800,000; Vancouver, B. C., \$645,118,000; Calgary, \$275,492,000; Ottawa, \$244,123,000; and Edmonton, \$220,727,000.

FAILURES. (a) *Commercial.* *Bradstreet's* record showed a total of 13,832 commercial failures in the United States in 1912, being an increase of 9.3 per cent. over 1911. By geographical divisions they were distributed as follows: New England, 1489; Middle States, 4611; Western States, 2403; Northwestern States, 831; Southern States, 3144; Far Western States, 1354. The total number was greater than in any year since 1896, excepting 1908. This was explained in part by the fact that the number of business concerns, 1,673,000, was 44 per cent. greater than in 1900; and by the effects of a late spring, lower values of cotton in the South on account of the large crop, and minor disturbances. The percentage of failures to the number in business was .82, as compared with .77 in 1911, .72 in 1910, .76 in 1909, and .94 in 1908. The total liabilities were \$198,000,000; the total assets were almost exactly one-half that amount. The total of liabilities exceeded only slightly the totals of 1911 and 1910, and was much below the total of 1908, and only slightly more than one-half the total of 1907.

There were an unusual number of large failures, this being largely responsible for the great total. There were about 250 failures, each having liabilities of at least \$100,000 and with a total of \$88,000,000. The largest single failure was an automobile concern; other large failures were in the automobile, iron and steel, cement, cotton and wool, lumber, building, and brewing industries.

The Canadian failures numbered 1310, as compared with 1401 in 1911; 1469 in 1910; 1588 in 1909; and 1715 in 1908. The total liabilities were \$12,261,000, being smaller than in any year since 1907. The total assets were \$5,593,000.

(b) *Financial.* Banks were generally prosperous in 1912. Banking suspensions totaled 48, as compared with 61 in 1911, 44 in 1910, 40 in 1909, and 132 in 1908. There were suspensions of banks as follows: National, 4; State, 16; savings, 2; private, 23; and loan and trust companies, 3. The total liabilities of all suspended institutions were \$18,937,000, to which private banks contributed 32 per cent., loan and trust companies 30 per cent., State banks 21 per cent., national banks 11 per cent., and savings banks one-third of 1 per cent. The total was the smallest in any year since 1902, and in 20 years was the smallest except in 1902 and 1900. The liabilities constituted only 4 per cent. of all failure liabilities in 1912, as compared with 14 per cent. in 1911 and 52 per cent. in 1907. The total assets were \$5,249,000, bearing a favorable ratio to the liabilities.

(3) *Railway Receiverships and Foreclosures.* In 1912 11 unimportant roads with 525 miles of lines, and total funded indebtedness of \$4,815,300, and total outstanding stocks of \$14,813,190 were sold under foreclosure. These figures compared very favorably with those of the three years preceding, but exceeded the mileage and total securities of roads sold in 1906-7-8. The principal roads involved were the Chicago, Peoria, and St. Louis, with 255 miles of line, funded debt of \$3,730,000 and stocks of \$7,350,000. Roads placed in the hands of receivers were 13 in number with a total mileage of 3784 miles, with funded debt of \$107,354,854 and total stock of \$74,757,643. In addition to these, the Tennessee Central with 284 miles of road, \$12,367,900 funded debt, and \$7,941,450 stock, went into the hands of a receiver on December 31. The number of roads and mileage exceeded the figures of 1909-10-11, but the total of bonds and stocks was exceeded in 1911. The principal road involved was the Père Marquette with 2331 miles, \$63,672,000 bonds, and \$26,186,000 stock. Other principal roads were the Kansas City, Mexico, and Orient with 764 miles, \$21,146,000 bonds and \$25,000,000 stock; and the Denver, Northwest, and Pacific with 211 miles, \$11,288,000 bonds, \$10,940,000 stocks. For an account of these failures, see RAILWAYS.

CANADA. The year was one of marked prosperity in Canadian provinces, as shown by a wheat crop of more than 200,000,000 bushels, total value of farm products exceeding half a billion dollars, and an influx of about 400,000 immigrants. The growth of industry and population in the eastern section was above the normal and in Manitoba, Saskatchewan, and Alberta it was very extraordinary. These sections experienced a great increase of population, bountiful crops, and phenomenal rises in the value of real estate. Building construction

was consequently unusually active. The cities of Winnipeg, Medicine Hat, Edmonton, and Calgary had virtual booms. The bank clearings of Winnipeg increased 21 per cent. over 1911, and those of Edmonton, 82 per cent. Railroad building in the Canadian west and north-west was very considerable, several new outlets for the products of these sections being under way, including extensions by the Canadian Northern, Grand Trunk Pacific, the Canadian Pacific, and the Hudson's Bay railways. Montreal held its position of first rank as a manufacturing centre, with Toronto second and growing more rapidly than its larger rival. Foreign trade exceeded \$1,000,000,000 in value, exports being about \$680,000,000, and imports about \$331,000,000. For construction work Canada annually borrows about \$200,000,000 of British capital. This investment of foreign money was seriously interfered with in later months by the Balkan War. The result was a checking of construction, a sharp decline in available bank reserves, and tightness of money.

GREAT BRITAIN. London comment on 1912 showed that it was a year of good trade but had politics. There was an unusual amount of labor unrest; the coal strike of seven weeks' duration in the spring was a severe blow to manufacturing and transportation (see **MINIMUM WAGE**); the dockers' strike in the summer interfered with foreign traffic (see **STRIKES AND LOCK-OUTS**). Great political excitement prevailed throughout the year; the Balkan War was a factor of first importance in the later months. Nevertheless foreign trade responded to the worldwide upward movement, there being an increase in the first eleven months of 9 per cent. in the value of imports, 7 per cent. in exports, and 9 per cent. in reexports. Railway traffic increased in the second half year so as to more than offset the effects of labor disputes. Bank clearings at London to December 11 showed an increase of 8.5 per cent. over 1911. The London *Economist* reported issues of new capital to December 14 to the amount of £202,000,000, or the largest in a decade except in 1909. The Bank of England took a rather serious view of the general situation owing partly to a belief that much overcapitalization had prevailed. Its discount rate was lowered to 3 per cent. in May, raised to 4 per cent. late in August, and to 5 per cent. after the Balkan War began. In general the discount rate ranged nearly 1 per cent. higher than in 1911. Excessive hoarding on the continent due to the possibility of war was a factor in this result.

CONTINENTAL EUROPE. On the continent the conspicuous feature of the year was the Balkan War. This introduced doubt and hesitation into what would otherwise have been a year of extraordinary prosperity. There was some drain of gold by the Allies previous to the outbreak of hostilities; and thereafter hoarding of gold in France, Austria, and central Europe was estimated at thirty-five million pounds or more. Everywhere, and particularly in Austria and the war zone, the fourth quarter was one of great scarcity of money, of excitement, strain, and declining security values.

In *Germany* unprecedented records were made in railway receipts, volume of foreign trade, steamship tonnage under construction, the production of pig iron, coal, coke and lignite, and bank clearings. The money market was easy in January and early in February, making pos-

sible the repayment of the large American loans contracted in 1911. Security prices rose in January but fell slowly thereafter until mid-summer. This decline was due to the repayment of American loans and the flotation of large Prussian and German loans exhausting the reserves of the money market. A recovery in September was followed by greater decline in October and November, due to the war scare and a very tight money market. The total loss in values of stocks listed on the Berlin exchange during October exceeded half a billion dollars. American securities in considerable volume were unloaded. The rate of the Reichsbank was reduced from 5 to 4 1-2 per cent. in June owing to temporary ease of the money situation, but it was compelled to advance its rate to 5 per cent. on October 24, and to 6 per cent. on November 14. The extraordinary condition of German credit appears clearly from the fact that in Berlin the private rate of discount rose from 4 5-8 to 6 per cent., while in London it fell from 5 to 4 3-4 per cent. The markets for money and securities were therefore much depressed at the close of the year, but the general economic situation was good. Record crops had been produced; both exports and imports gained over 1911; the ocean-carrying trade was in an unusually prosperous state; freight movements were very large, and an unprecedented car shortage existed in October and November; shipyards had a record output and also maximum orders at the year's close; railway earnings attained new maxima.

In *France* the year was one of moderate prosperity. As shown by the few available statistics foreign trade varied little from that of 1911; the Paris bourse, like the stock exchanges of all countries, had its ups and downs; crops were considerably better than in 1911, but not abnormal because of excessive rainfall; and the money market tightened sharply in the closing months. Imports for the first eight months totaled \$1,019,000,000 in value, or slightly less than for same period in 1911. About 60 per cent. of imports were raw materials, 24 per cent. were foodstuffs, and 16 per cent. were manufactures. The exports for the eight months aggregated \$821,760,000 or \$64,000,000 more than for these months in 1911. Business conditions up to October were better than in 1910 or 1911. Prices of securities rose until about June 1, when trading became less active. In the late summer, however, occurred a period of over-speculation in Russian industrials and certain copper and other mining stocks. Following the outbreak of the Balkan War the Bank of France took the very exceptional course of advancing its rate from 3 1-2 to 4 per cent. This is believed to have stimulated the hoarding which was already noticeable and to have reacted unfavorably on the availability of gold and credit in all European banking centres.

FINCH, WILLIAM ALBERT. An American lawyer and educator, died March 31, 1912. He was born in Newark, N. J., in 1855, and graduated from Cornell University in 1880. In the same year he was admitted to the bar and until 1891 practiced at Ithaca, N. Y. In that year he was appointed professor of law in Cornell University. He held this position until the time of his death. He was regarded as an authority on the law of real property and he published *Finch's Selected Cases on the Law*

of Property and Land, and The Law of Property and Land—A Syllabus (1900).

FINLAND. A Russian grand duchy on the Gulf of Bothnia. Capital, Helsingfors.

AREA AND POPULATION. Area in square kilometers and population December 31, 1910, are given below by governments:

	Sq. kms.	Pop.
Nyland	11,872	376,218
Åbo-Björneborg	24,171	499,332
Tavastehus	21,584	342,321
Viborg	43,065	521,469
St.-Michel	22,840	198,829
Kuopio	42,730	333,777
Wasa	41,711	514,940
Uleåborg	165,641	328,311
Total	873,604*	3,115,197

* Of which, 47,829 sq. kilometers internal waters.

The total area in square kilometers is equivalent to 144,249 square miles. The population was 33 per square kilometer in Nyland (greatest density), and 2 in Uleåborg (the least), and the average density for the country was 9. Evangelicals numbered 3,057,627, Greek Orthodox 52,004, Baptists 4467, Methodists 676, Roman Catholics 423. Speaking Finnish as their native tongue were 2,565,742, Swedish, 344,364, Russian 7339, German 1794, Lapp 1660, other tongues 298. Number of marriages (1910), 18,781; births, 95,363; deaths, 51,007; still-births, 2379. Of the 2,712,562 adults listed as actively pursuing occupations, 1,555,357 were engaged in agriculture. Helsingfors had 147,218 inhabitants, Åbo 49,691, Viborg 49,007, Tammerfors 44,147, Nikolaistad 21,819, Björneborg 17,466, Uleåborg 10,114, Kuopio 15,845.

Education is on a much higher plane than in Russia. Primary instruction is free and compulsory between the ages of seven and fifteen. Secondary schools are well attended, and special schools of agriculture are maintained, devoting particular attention to stock-raising and dairying.

PRODUCTION AND COMMERCE. Cereal crops are grown; also roots and forage plants. The timber industry is unimportant. Iron ore is mined and pig and bar iron are produced for export.

The trade by countries of origin and destination, with values in thousands of marks (gold) is shown below for 1911:

	Imps.	Exps.		Imps.	Exps.
Germany	173,400	46,500	France	6,400	27,100
Russia	137,500	89,000	Spain	2,200	8,700
U. K.	61,700	88,100	Other	5,200	7,700
Denmark	23,100	11,700			
Swe. & Nor.	21,600	14,500	Tot. '11	444,500	319,600
Neth., etc.	13,400	26,500	Tot. '10	384,100	288,100

Principal articles of export, 1911 trade, values in thousands of marks—timber, 160,500; paper and pulp, 57,400; butter, 34,000; hides and leather, 12,200; wooden wares, 6500; fish, 5300; cotton textiles, 4300; iron, 2300. Vessels entered (1911), 9599 of 2,690,475 tons; cleared, 9509 of 2,648,285. Merchant marine (January 1, 1912), 2959 sailing; (327,625 tons) and 487 steamers (72,013.)

COMMUNICATIONS. Railways in operation January 1, 1912, 3763 kilometers. The Russian government has decreed that all new lines are to be constructed in conformity with Russian

lines, and that existing lines are to be so altered as to permit the use on them of Russian rolling stock. With the completion of the Kaskö-Kristinestad line will be begun extensions of present lines to form a continuous route from Nikolaistad to St. Petersburg. The projected alterations and extensions were decided upon, not by the Finnish Diet, but by Russia; though the Finnish railways are for the most part owned by the (Finnish) state.

FINANCE. The revenue for the year 1911 amounted to 159,421,716 marks (1 mark=19.3 cents); of which 69,033,168 was derived from state domains and forests, railways, canals, etc.; 62,660,151 from indirect taxes (customs 53,050,218, and excise 9,609,933); 7,402,091 from posts, 6,450,758 from direct taxes, 3,790,329 from stamps, etc. Expenditure, 159,956,052 marks, of which 75,918,101 for communications, 17,180,055 for worship and instruction, 13,526,102 for civil administration, 12,178,917 military contribution, 8,473,672 debt charge, 7,125,419 for agriculture, etc.; 6,665,794 for commerce and industry; etc. The 12,178,917 marks military contribution goes into the Russian treasury. The debt stood January 1, 1912, at 176,313,484 marks.

GOVERNMENT. Until the present régime Finland enjoyed the autonomy guaranteed her in the reign of Alexander I. Latterly the Russification system has been applied to an increasing number of departments, until the schools, the press, the law, and the legislature have all been invaded. By the end of 1912 the constitution was virtually annulled (see succeeding paragraphs). The Diet (200 members elected by universal suffrage for three years), formerly possessed of large powers in civil administration, has latterly been little more than a figurehead. The Russian sovereign is the grand duke. There is a resident governor-general (1912, F. A. Seyn), and a secretary of state (Lieut.-Gen. A. [Baron] Langhoff), residing at St. Petersburg.

HISTORY

THE CONSTITUTIONAL HISTORY QUESTION. For more than a dozen years the apparent design of Russia to assimilate Finland to the rest of the empire without regard to her constitutional rights has aroused the bitter opposition of the Finns and occasioned protests from their sympathizers throughout the world. Further measures in pursuance of this policy were taken by the imperial government in the opening months of 1912, but before giving an account of them it may be well to review briefly the recent history of Russia's relations with Finland. In the latter country it was generally assumed that the grant of Alexander I. in 1809 established the grand duchy as a separate state with inalienable rights against the pretensions of Russia. On the other hand, Russian opinion regarded the promise of Alexander as no more binding than that of Peter the Great to the Baltic provinces and held that Finland was merely an autonomous province of the empire. It had been the policy of Russia to promise to respect the national institutions of her newly acquired territories and later step by step to proceed in her course of centralization and assimilation without regard to her agreement. That this did not happen to the Finns was due to their steady and vigorous insistence on their

own rights. Alexander II. expressly recognized the legislative authority of the Finnish Diet over a wide range of fundamental matters and by his own declaration governed Finland as a constitutional ruler. Since 1809 therefore the Finns have obeyed the czar as the constitutional grand duke of Finland, apart from his capacity as autocrat of all the Russias. Enjoying virtual independence Finland developed along her own lines and her national institutions had nothing in common with those of Russia. Russian sovereignty was practically limited to matters pertaining to the imperial family, foreign relations, and the army and navy. Customs tariffs divided the two countries, and they had no common bank or currency system or other institution expressing a community of interest. The czar, in his capacity of grand duke, had for his adviser a secretary of state for Finland, who must be a Finn. The Finnish Senate, at Helsingfors, under the presidency of a Russian governor-general, directed the internal affairs of the country, as a national ministry in the name of the grand duke. In questions concerning both Finnish and imperial interests the secretary of state for Finland referred each subject to the proper Russian minister and the two addressed a conjoint report thereon to the czar, but the Finns did not regard this as involving the supremacy of the Russian ministerial council over Finnish officials. This view was contested by Russian statesmen, and by the act of June 2, 1908, it was provided that all Finnish administrative questions should be first submitted to the Russian ministerial council, which would decide whether or not they concerned the general interests of the empire. The main issue between the two governments, however, concerned not administrative, but legislative independence, to which Finland could show a clearer title. The Finns and their sympathizers took their stand on the principle that the authority of the Finnish Diet could not be curtailed without its own consent. If, therefore, the Russian government wished to establish a different system of legislation for matters affecting the common interests of Finland and the empire, the consent of the Diet at Helsingfors must first be obtained. The Finns absolutely denied Russia's right to disregard this rule on the score of imperial sovereignty. On the other hand, Russian nationalist sentiment demanded complete subordination of Finland to the imperial government.

IMPERIAL RESTRICTIONS. By the law of February 15, 1899, proclaimed during the high-handed régime of Governor-General Boubrikov, Russia required that all matters of legislation that concerned the common interest should be referred to the czar, who with the advice of the imperial council, should decide whether they affected the general interests of the empire, and should be removed from the jurisdiction of the Finnish Diet. It also provided that the governor-general, the secretary of state, and certain Finnish senators, appointed by the throne should participate in the proceedings of the Finnish Diet. This was bitterly opposed, not only in Finland, but in other countries, where the so-called Russification of Finland aroused much sympathy, and led to many public protests. During the stormy days of the Russian revolution, this act was provisionally superseded (November 4, 1905), and for a while Fin-

land was left to her own devices. The decrees providing for the new Russian Duma did not provide for any Finnish representation in that body and the grand duchy was for the time being in a position of political isolation. But the growth of Russian nationalist sentiment on the one hand, and the uncompromising attitude of the Finn leaders on the other, soon brought matters once more to a crisis. The Stolypin government was aggressively nationalist in its policy, and the third Duma had a nationalist majority. A new law, curtailing Finland's legislative independence, was passed on June 30, 1910. This provided that thenceforth laws of general interest must, at the instance of the czar alone, and after consulting the Finnish Diet, follow the usual Russian legislative procedure, that is, be voted by the Duma and the imperial council. Two representatives from Finland were to attend the sessions of the Duma. A few months after the promulgation of this law the Finnish Diet, in extraordinary session, denied its validity and refused to send deputies to the Duma. The law of June 30, 1910, attempts to enumerate the matters of general interest which fall within the competence of the Duma, but their range is very wide and, the principle being admitted, there is nothing to prevent their indefinite extension in the future. They include not only the right of the Duma to regulate Finland's financial relations to the empire, the military service, the rights of Russian subjects in Finland, etc., but even the rights of meeting and association, and questions of education and the press. The Duma contained, however, many friends of Finland, who vigorously opposed the passage of the law. It was evident that Russian public opinion was divided on the subject, and that Finland could rely on a considerable minority in the Duma for support when the question was reopened.

FURTHER MEASURES. In January and February, 1912, the Russian government definitely applied the principle of the law of 1910. Two laws pertaining to Finland were passed by the Duma, and sanctioned by the czar as laws of general interest. The first of these (January 24, 1912) abolished the obligation of personal military service on the part of the Finns and in lieu thereof required an annual payment of 20,000,000 markkas. Finland had long contended that her national army could not leave her own territory and that principle was laid down in a law passed in 1878, which forbade the national troops to serve outside Finland, even in time of war. The imperial government could not admit that principle, but on the other hand was loth to force Finns into the service against their consent, both on account of the difficulty of such a policy, and on account of its bad effect on the morale of the army. The law of February 2, 1912, bestowed on Russian subjects living in Finland the same rights as those possessed by the Finns themselves. This was regarded by the Finns as a further step toward Russification, for it was feared that the Russian government would appoint these Russian residents to office in the Finnish administration and thus gradually denationalize the service. In a small country, where there were only about 8000 public functionaries, it was pointed out that it would be easy to turn over a majority of the offices to Russian bureaucrats. The Finns saw in this measure the

STATISTICS OF FIRES IN EUROPEAN CITIES IN 1911

Place	Area Square miles	Population	Number of Alarms	Total No. of Fires	Confined to Building or Place of Origin	Total Loss	No. of Fires per thousand Population	Loss per Capita	Loss per Fire

designs of the Nationalists and recalled the late Premier Stolypin's attempt to introduce courses in the Finnish tongue in the University of St. Petersburg, with a view to fitting Russians for service in the Finnish civil service. Whether the law would be applied in a moderate spirit, or in accordance with the extreme views of the Nationalists, remained to be seen. M. Stolypin's successor to the premiership, M. Kokovtsov, was generally regarded as more inclined to a moderate attitude toward the Finns, and it was observed that he had gone no further with Stolypin's project for the annexation of the two parishes of the Finnish province at Vyborg. Stolypin had decided on this measure a few weeks before his death, and so late as April 19, 1912 a member of the imperial council declared that "Russia has no need of the approval of the alien populations. We have not taken them to give them pleasure, but because they were necessary to us." Conservative journals, like the *Novoye Vremya*, attacked M. Kokovtsov for his remissness in this matter.

FIRE DRILLS. See FIRE PROTECTION.

FIRE PREVENTION. See FIRE PROTECTION.

FIRE PROTECTION. During the year 1912, the committee on statistics and origin of fires of the National Board of Underwriters published a report, giving the record of fire losses in the United States and foreign countries, in continuance of their investigations, begun in the previous year. As a result, they were able to show returns for a larger number of European cities than previously, and to make a comparison between the per capita losses for two successive years. The summary of these statistics is given herewith:

Country	No. of Cities Reporting Loss		Population		Per Capita Loss	
	1910	1911	1910	1911	1910	1911
U. S.	297	298	29,996,723	31,210,084	\$2.39	\$2.62
England	11	12	2,335,847	9,898,317	.44	.53
France	8	3	4,392,529	3,518,493	.92	.81
Germany	13	8	5,616,822	2,306,354	.19	.21
Ireland	2	2	657,680	694,272	.45	.58
Scotland	..	2	..	484,190	..	.56
Italy	..	6	..	1,373,995	..	.31
Russia	..	2	..	3,483,291	..	1.17
Austria	..	1	..	2,031,498	..	.08
Canada	..	1	..	125,000	..	2.61

This report brings out the interesting fact that in no one of the foreign cities does the

STATISTICS OF FIRES IN AMERICAN CITIES IN 1911

Place	Area Square miles	Population	Number of Alarms	Total No. of Fires	Confined to Building or Place of Origin	Total Loss	No. of Fires per thousand Population	Loss per Capita

Washington	70	350,000	1,228	1,139	1,080	653,515	3.26	1.87
Los Angeles	121	330,000	1,537	1,352	1,292	918,209	4.10	2.78

per capita loss approach five dollars, while in the United States, in 1911, there were 34 such cities, in nine of which the loss exceeded ten dollars, reaching a maximum in the case of Bangor, Me., where it was \$137.43. That the lesson of adequate fire protection seems to be hard to learn, is shown by the fact that Bangor, Me., and Atchison, Kan., in 1910, as well as in 1911, suffered losses in excess of five dollars.

As a basis of more detailed comparison, the statistics on page 227 for foreign cities may be cited from this report and compared with similar cities in the United States.

AMERICAN FIRE LOSSES IN 1912. The losses by fire in the United States and Canada during the year 1912, as recorded by *The Journal of Commerce and Commercial Bulletin*, of New York, aggregated \$225,320,900, as compared with \$234,337,250 in 1911, and \$234,470,650 in 1910. The losses during January and February were particularly heavy, aggregating \$64,254,800, and were in large measure due to the severe winter and the prevalence of high winds. The aggregate amount of improved and insured property destroyed was relatively larger than in the preceding years.

The fire losses in the United States and Canada during the thirty-six years ended with 1912, aggregated \$5,406,666,325, or an annual average of \$150,185,181. From the accompanying table giving the losses by years during the years 1877-1912, it will be noted that the tendency is almost steadily upward as regards the country's fire waste, and it was considered impossible to determine to what extent the strenuous efforts to reduce fire risks and thereby diminish the losses in general are offset by the new factors of our civilization that go to produce new fire hazards:

1912	\$225,320,900	1894	\$128,246,400
1911	234,337,250	1893	156,445,875
1910	234,470,650	1892	151,516,000
1909	203,649,200	1891	143,764,000
1908	238,562,250	1890	108,993,700
1907	215,671,250	1889	123,046,800
1906	459,010,000	1888	110,885,600
1905	175,193,800	1887	120,283,000
1904	252,554,050	1886	104,924,700
1903	156,195,700	1885	102,818,700
1902	149,260,850	1884	110,149,600
1901	164,347,450	1883	110,149,000
1900	163,362,250	1882	84,505,000
1899	136,773,200	1881	81,280,000
1898	119,650,500	1880	74,642,400
1897	110,319,650	1879	77,703,700
1896	115,655,500	1878	64,315,900
1895	129,835,700	1877	68,265,800
Total for 36 years.....		\$5,406,666,325	

A carefully compiled record, also made by the *Journal of Commerce*, summarizing the fires credited with causing a property loss of \$10,000 or over in each instance shows that there were no less than 3640 such fires during 1912. This compares with 3410 fires in 1911 and 3225 in 1910.

FIRE PREVENTION. On October 9, which was the forty-first anniversary of the great Chicago fire, the celebration of Fire Prevention Day took place quite generally throughout the United States. In Illinois, Iowa, and New York official proclamations were issued by the governors, calling for the observance of the day, and recommending that public and private consideration be given to this important sub-

ject. In several western States there was an even more practical movement, whereby individual householders endeavored to put their premises in order so as to eliminate as far as possible all danger of fire.

PRIVATE FIRE DEPARTMENTS AND DRILLS. During 1912, great attention was paid to the organization of private fire departments in large manufacturing establishments and the training of employees to deal promptly with fire, through organized fire brigades, and also to train the great mass of workers, especially where large numbers of women are employed, to leave the premises by prearranged methods of exit in orderly discipline. The necessity for this work was emphasized in a number of fatal fires in manufacturing plants, previous to 1912, and the development of this work usually under trained experts was rendering such drills remarkably effective. In some States training and drills of employees can be ordered by responsible State or city officials, but in the main the organization is effected by employers themselves with the assistance oftentimes of outside experts. If the plant is a large one, the system is correspondingly elaborate and the fire brigade is trained not only to answer various stations, but to handle the fire-fighting equipment so that any incipient blaze can be promptly checked before the arrival of the city fire apparatus. In several cases, such fire organization has been able to deal promptly with fires that otherwise would have occasioned serious loss, not to mention possible panic and the movement is endorsed, not only as an insurance measure, but on the score of economy, as it gives a feeling of assurance to the operatives and enables the work to be performed more effectively.

HIGH PRESSURE SYSTEMS. During 1912 there was put in service, at San Francisco, a high pressure fire system, made possible by a bond issue of \$5,400,000, voted in 1908, when the lessons of the 1906 conflagration were being carefully considered. This scheme provides protection for about 5000 acres, or the larger part of the built-up area of the city, starting at Twin Peaks, a point 758 feet above the water front, and eventually covering the entire city. At Twin Peaks there is a two-compartment storage reservoir of 11,000,000 gallons capacity, and at Ashbury Heights and at Clay and Jones Streets there are distributing or pressure regulating tanks at elevations of 462 feet and 388 feet, supplying respectively the upper and lower zones. In addition there are two salt water pumping stations, each with four units of 2700 gallons per minute capacity, and water-front connections for two fire boats of 10,000 gallons capacity. This gives a storage capacity of 12,000,000 gallons of fresh water and a total pumping capacity of 41,600 gallons of salt water per minute. From the distributing reservoirs adequate water and pressure is secured throughout the protected district and various means of safeguarding supply and distribution, and preventing possible interruption from earthquake or other causes have been devised, the geological formation of the region having been most carefully considered. The pumps for the reservoirs are centrifugal electrically driven, but those on the water-front are 3-stage centrifugal driven by Curtis steam turbines. These stations are fireproof buildings with storage capacity for fresh water and crude oil, which

is used for fuel under the boilers. The pipe line is cast iron and the aggregate length is about 70 miles. This new system gives San Francisco excellent fire protection, and were a higher standard of building, as regards fireproof construction, observed, it would be in an enviable position. Soon after the system had been placed in successful use it was recommended that it should be extended to the grounds of the Panama-Pacific Exposition.

The Baltimore high pressure fire system, which had been under construction since 1909, was completed during 1912, and on June 7 was formally and successfully tested. This system is unique in employing lap-welded steel pipe with bolted flange joints and portable hydrant heads, whose hose outlets are controlled by regulating valves so that each hose stream may be independently regulated. The district protected by the mains of the system covers about 170 acres and is bounded by Pratt, Eutaw, Franklin, Howard, Saratoga, Gay, Baltimore, and South streets. The total length of mains in the city is distributed as follows: 30-inch main, .66 miles; 24-inch, .025 mile; 16-inch, 3.24 miles; 10-inch, 5.30 miles. There are 16-inch mains three blocks apart in both directions with 10-inch mains in all other streets and 8-inch mains used as hydrant branches. The hydrants number 226, spaced about 170 feet apart, and there is a fire-boat connection at the water-front. The pumps supplying the system are steam driven reciprocating displacement pumps. Three are Allis-Chalmers twin horizontal Corliss simple non-condensing crank and fly wheel pumps, each with cylinders 22 inches in diameter, 36 inches stroke, and plungers 13%, with a total discharge capacity of 12,770 gallons per minute, against a pump pressure of 242 pounds, and one a Epping-Carpenter horizontal duplex direct acting compound non-condensing pump, 14 and 25 x 12 x 16, capable of delivering 1000 gallons per minute at 32 revolutions.

MOTOR APPARATUS. During the year considerable progress was made with motor fire apparatus, and in almost all cases where new equipment was required, automobile hose wagons, combination engines, hook and ladder trucks, or water towers were supplied. In New York City, the leading development was a front drive tractor, for use with the ordinary steam fire engine, supplanting the horse draft gear at the front wheels. The New York fire department did not feel convinced of the efficiency of gasoline propelled pumping engines, although it maintained one, and believed that the same fire engine should not be displaced, but equipped with more motors in place of horses. Early in the year a fire engine supplied with a four-cylinder gasoline motor geared to the front wheels was installed at a busy station, and during a test of several months it performed most satisfactorily. This resulted in contracts being awarded for 28 of these engines, at a total expense of about a quarter of a million dollars, said to be the largest single contract for fire apparatus ever made.

The New York fire department received several aerial motor trucks with gasoline-electric motor propulsion, the current being supplied to motors at each of the four wheels from a generator, direct connected to a gasoline engine, the power plant being located behind the front wheels and under the driver's seat. Various other combinations of gas-electric motors, elec-

tric storage batteries, and gasoline engines with direct transmission were in use in various fire departments, and extension ladders up to 85 feet in length were being supplied to many of the larger fire departments.

As will be seen from the accompanying table, the largest fires during the year 1912 were those at Houston, Tex., which destroyed a number of cotton compresses and other property, causing an estimated loss of \$4,500,000, and the fire in New York City, which destroyed the Equitable Life Assurance Society's building, with a loss of \$3,000,000, but which, however, did not involve much insurance.

During 1912 there were no less than twenty-eight fires which caused a property damage of half a million dollars or over. These large fires are given below:

Houston, Tex., cottonseed oil plant.....	\$ 625,000
New York City, Equitable Life Building.....	3,000,000
New York City, terminal warehouse....	1,100,000
Newark, N. J., furniture store & other.....	500,000
Hallfax, N. S., sugar refinery.....	1,000,000
Philadelphia, Pa., millinery factory and other.....	1,100,000
Chicago, Ill., grain elevator.....	600,000
Houston, Tex., cotton compresses and other.....	4,500,000
Toronto, Ont., car barns and other.....	500,000
Providence, R. I., rubber warehouse....	575,000
Houston, Tex., several business houses.....	625,000
Flint, Mich., deaf and dumb school.....	600,000
Schenley, Pa., whisky warehouse.....	800,000
Keasbey, N. J., brick works and asphalt plant.....	940,000
Moose Jaw, Sask., electric power plant.....	500,000
Telluride, Col., stamp mill.....	500,000
Chicoutimi, Que., various.....	1,200,000
Ray, Ariz., business section of town....	500,000
Saskatoon, Sask., department store....	500,000
North Adams, Mass., theatre, hotel, and stores.....	600,000
Vancouver, B. C., several wholesale stores.....	1,750,000
New Iberia, La., sugar plant.....	500,000
Ronan, Mont., business section of town.....	500,000
Ocean Park, Cal., hotel, casino and stores.....	1,125,000
Cleveland, O., wholesale grocery house.....	500,000
Benicia, Cal., arsenal.....	1,000,000
Philadelphia, Pa., wharves and railroad property.....	1,000,000
Bayonne, N. J., steamers and oil works.....	500,000

The interest in the subject of fire protection and fire prevention manifested during the year, was evidenced by the publication not only of many magazine articles in the lay as well as in the engineering and insurance press, but of several important books. These included *Fire Prevention*, by ex-Chief Edward F. Croker, New York City Fire Department, *Fire Prevention and Fire Protection*, by J. K. Freitag, and *Fire Protection*, by P. J. McKeon, all of which were substantial contributions to the subject.

During the year the Forest Service of the United States Department of Agriculture, published an interesting bulletin on forest fires, dealing with their causes, extent, and effects, and giving a summary of the recorded destruction and losses. This was prepared by Fred G. Plummer, geographer, and was a valuable contribution to the literature on this subject, as in addition to statistics and description, it discussed the various meteorological phenomena observed in connection with great forest fires in the United States and Canada. See **FORESTRY**.

FISH AND FISHERIES. The United States Bureau of Fisheries, in its various laboratories, carried on the usual amount of research during the year. A comparatively new

line of work is the investigation of the fresh-water mussels as a source of supply for button material, and also as providing fresh-water pearls. Lefevre and Curtis continued their work on the development of the mussel, with attention to the problem of artificially rearing the animals in the Mississippi river, and various explorations of other rivers in the Appalachian system were conducted. The fiscal year of the bureau ends in June, but the report of the commissioner, giving statistics as to the distribution of fish and the value of the fisheries for the year, was not available at the time of preparing this report. An unofficial statement as to the value of the swordfisheries was that 1,014,350 pounds were landed at Boston in 1912, having a value of \$93,370. The American Fisheries Society met in Denver, September 3-5. The meeting for 1913 is to be held in Boston with Dr. Charles H. Townsend of the New York Aquarium, as president. Fish collections were made during the year in Panama, and by Eigenmann in Colombia, S. A. It is believed that the fish fauna of the Panama region is completely represented in the collections, of which the one sent in 1912 was the second. Thompson studied the dorsal fin of the rockling, *Motella*, and concluded that it is not used as a lure, because it is situated too far behind the mouth, and because it is doubtful if the prey has sufficiently clear vision to see it. It is abundantly supplied with sense cells, and probably is a sense organ.

Hussakoff reported on the spawning habits of the sea lamprey, whose breeding season on Long Island, N. Y., is apparently in May and early June. Nests two to three feet in diameter are built anywhere in the rivers. The larger stones are carried out by the sucker-shaped mouth. Both sexes work at nest building, and copulation takes place at frequent intervals for several hours. Apparently the lampreys die after egg laying, being exhausted by the labor of preparing the nest, and the subsequent sex activity. They pay very little attention to observers standing near the nest, and apparently have very feeble senses of sight and hearing.

The second specimen of living lungfish ever brought to the United States was sent to the American Museum of Natural History from Africa. It was shipped in a ball of dried mud into which it had burrowed.

C. Tate Regan published in 1912 a volume on the *Fresh Water Fishes of the British Islands*, which was regarded by reviewers as of very great value to anyone interested in the British fishes. For fisheries in foreign countries, see articles on countries.

FISHERIES AWARD. See **ARBITRATION**, **INTERNATIONAL**.

FISK UNIVERSITY. An institution for the higher education of the colored race at Nashville, Tenn., founded in 1866. The total number of students enrolled in the various departments of the university in the autumn of 1912 was 312. The teachers numbered 32, and the workers 12. The most notable incident in the history of the university during the year was the resignation of President George A. Gates. A successor had not been chosen at the end of the year. The sum of \$25,000 was given by Mr. J. Pierpont Morgan toward an endowment of the university. The income from all sources is \$50,000 a year. The library contains about 10,000 volumes.

FLAX. The world's commercial crop of flaxseed in 1912, as in previous years, was produced by the United States, Argentina, Russia, British India, and Canada. In total production the United States ranked first, with 28,073,000 bushels, while Argentina, in the harvest completed early in the year, produced 25,116,700 bushels, and Canada 21,143,400 bushels. The annual yield of Russia for recent years has ranged from 20,000,000 to 23,000,000 bushels, and British India has an average annual yield of about 15,000,000 bushels, the range from year to year being, however, quite wide. The production of 1912 in the United States has never been equaled and was over 44 per cent. above the five-year average and more than double the short crop of 1910. The farm value on December 1, 1912, was 114.7 cents per bushel, as compared with 182.1 and 231.7 cents for that date in 1911 and 1910 respectively. On this basis the crop is valued by the Department of Agriculture at \$32,202,000, or well above the average value of the five preceding years. The highest yields by States in 1912 were as follows: North Dakota, 12,086,000 bushels; Montana, 5,520,000 bushels; South Dakota, 5,323,000 bushels, and Minnesota, 4,121,000 bushels. In Montana the production has more than doubled since 1910, while in many of the older flaxseed-producing States the crop no more than holds its own. The flaxseed crop of Canada more than doubled in both acreage and yield from 1911 to 1912. The average annual Canadian production for the five years 1905-1909 was only 1,445,000 bushels.

Statistics regarding flax culture for fibre are rather meager. The principal flax fibre region is a belt about 350 miles wide and extending from the southern part of the Baltic Sea eastward across Russia to the Siberian border. While seed production there receives only secondary consideration the region is nevertheless one of the principal flaxseed-producing sections of the world. In Europe the flax fibre crop of 1912 was fairly good, but wet weather interfered to some extent with the harvesting and retting.

FLEET REORGANIZATION. See **NAVAL PROGRESS**, *England, France, General Progress*.

FLORIDA. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population of 752,619 in 1910, the foreign-born whites numbered 33,842, compared with 19,257 in 1900. The largest number, 10,778, came from Cuba and other West Indies; from Italy, 4535; from Spain, 4167; from England, 2917; from Germany, 2441. Other European countries were represented by smaller numbers. In 1910 the negroes numbered 308,669, and the mulattoes, 49,511. In 1890 the negroes numbered 166,180 and the mulattoes 19,757.

MANUFACTURES. The Thirteenth Census included statistics of manufactures in the State. These are for the calendar year 1909 and were compiled in 1912. The most important results are given in the table below. The industry in which the value of the product was greatest was tobacco manufactures, \$21,575,000 and in this industry there were employed 12,280 men. Lumber and timber products were valued at \$20,863,000 and gave employment to the largest number of men, 19,227. In the turpentine and resin industry were employed 18,143 persons and the value of the product was \$11,938,000. These are the only industries in which over 10,000 men were employed and in which the

product was valued at more than \$10,000,000. The number of wage earners in the State in 1909 was 56,532, of whom 53,520 were male and 3512 were female. Of the wage earners, 941 were under 18 years of age, and of these 41 were females. The prevailing hours of labor showed considerable diversity. Of the total number employed, 53.5 per cent. were in establishments where the prevailing hours were from 54 to 60 hours per week, and 30.6 per cent. in establishments where they were less than 54 a week, while 15.9 per cent. were in establishments where they were more than 60 a week. The largest number of wage earners, 8996, were in Tampa. In Key West were employed 2431, in Jacksonville 1888, and in Pensacola 961. The principal results of the census are shown in the following table, with corresponding figures for 1904 and the per cent. of increase between 1904 and 1909:

	Number or Amount 1909	1904	P. C. of Inc. 1904-09
Number of establishments	2,159	1,413	52.8
Persons engaged in manufactures	64,810	46,985	37.9
Proprietors and firm members...	2,712	1,769	53.3
Salaries employees...	4,625	3,125	48.0
Wage earners (average number)...	57,473	42,091	36.5
Primary horsepower...	89,816	43,413	106.9
Capital	\$65,291,000	\$32,972,000	98.0
Expenses	63,218,000	40,577,000	55.8
Services	27,937,000	18,437,000	51.5
Salaries	4,955,000	2,670,000	85.6
Wages	22,982,000	15,767,000	45.8
Materials	26,128,000	16,532,000	58.0
Miscellaneous	9,153,000	5,608,000	63.2
Value of products...	72,890,000	50,298,000	44.9
Value added by manufacture (value of products less cost of materials).....	46,762,000	33,766,000	38.5

AGRICULTURE. The acreage, value, and production of the principal crops in 191 and 1912 are shown in the following table:

	Acreage	Prod. Bu.	Value
Corn1912	656,000	8,515,000	\$6,727,000
.....1911	636,000	9,286,000	7,429,000
Oats1912	43,000	740,000	518,000
.....1911	43,000	580,000	435,000
Rice1912	600	15,000	14,000
.....1911	700	18,000	14,000
Potatoes ...1912	11,000	1,023,000	1,125,000

EDUCATION. The total enrollment of the schools of the State in 1911-12 was 157,161. Of these, 99,517 were white and 57,644 were colored. The average daily attendance was 110,364. Of these, 69,262 were white and 41,112 were colored. The teachers employed numbered 4284, of whom 3281 were white and 1003 were colored. Of the white teachers, 734 were males and 2547 were females. Of the negro teachers, 232 were males and 771 females. The average monthly salary paid to teachers was \$47.85. The average monthly salary of white male teachers was \$72.40; of white female teachers, \$48.37; male negro teachers, \$39.95; and female negro teachers \$28.12. The total expendi-

tures for school purposes in 1911-12 amounted to \$2,327,394. The total value of the public school property in the State was \$3,136,886. There are 83 high schools in the State.

FINANCE. There was a balance in the State treasury on January 1, 1911, of \$180,143. The total receipts during the year were \$1,188,162, and the total disbursements were \$1,031,906, leaving a balance on December 31, 1911, of \$336,399. The chief receipts were from taxes, from general license tax, from corporation taxes, and from the sale of fertilizer stamps. The chief disbursements were for the departments of State, administration of State government, education, and State institutions. The public debt of the State consists solely in refunding bonds, all of which are held by the educational funds of the State, which amounts to \$601,567.

CHARITIES AND CORRECTIONS. The institutions supported by the State include the Deaf, Dumb, and Blind Institute, the Confederate Soldiers' Home, the State asylums for the insane, and State prisons.

POLITICS AND GOVERNMENT

There was no meeting of the State legislature in 1912, as the sessions are biennial and the last was held in 1911.

CONVENTIONS AND ELECTIONS. On April 30 the Democratic presidential primary was carried for Mr. Underwood. Only the Democrats nominated by primary election, the Republicans, Progressives, Socialists, and Prohibitionists nominating their tickets in convention. There was a Democratic primary election for State officers and representatives to Congress. The Democrats nominated Park M. Trammell for governor. The Republicans in convention nominated William R. O'Neal. The vote on November 5, for President was as follows: Wilson, 36,416; Taft, 4279; Roosevelt, 4535; and Debs, 4806. It will be noted that the Socialist vote was greater than that cast for either President Taft or Mr. Roosevelt. For governor Mr. Trammell received 38,977 votes and Mr. O'Neal 2646. The Progressive candidate for governor, Hodges, received 2314 votes, Cox, Socialist, 3467 votes, and Bigham, Prohibitionist, 1061 votes.

OTHER EVENTS. On January 22, the city of Key West celebrated the formal opening of the Key West extension to the Florida East Coast Railway. Representatives were present from Italy, Mexico, Portugal, Costa Rica, the Dominican Republic, Ecuador, Guatemala, Salvador, and Uruguay. The United States armored cruisers Washington and North Carolina, and the scout cruisers, Salem and Birmingham, represented the United States navy. A Portuguese cruiser participated in the celebration.

As a result of certain reports published by the Department of Agriculture an investigation was authorized by the House of Representatives in the matter of the draining of the Florida Everglades. The engineers connected with this work were charged with having misapplied funds, and Mr. Elliott, chief engineer of the drainage division of the department, was dismissed. Representative Clark of Florida, on whose motion the investigation was begun, issued a statement in which he charged that the officers of the government made it possible for loan sharks to sell lands under from 2 to 10 feet of water, thereby bringing discredit upon the federal government and the State, while

enriching unscrupulous real estate boomers. Mr. Clark declared in a speech in the house that he could prove "that the Secretary of Agriculture told me in the presence of reputable witnesses that he suppressed a circular letter that gave the facts, at the instance of persons engaged in selling lands in the everglades of Florida." See **EXPLORATION**.

As a result of the controversy over the Everglades matter, the house committee on expenditures in the Department of Agriculture made an investigation of the work of the department in relation to the drainage of the Everglades. The report consisted of two parts, one expressing the views of the majority and the other, those of the minority. In general, the report of the majority of the committee was as follows: The waste lands of the United States consist of two great classes. One of these is lands which cannot be cultivated for lack of water. These are being reclaimed by a process of reclamation. The other lands are those which are entirely, or largely submerged by water, and are therefore useless in their present condition. Some of these can be reclaimed by drainage. These swamp lands have been allowed to pass through the hands of the federal government into those of the several States, which are less able to deal with such enormous undertakings as are involved in the drainage of these lands than the government would be. The States are also less competent to cope with the great powers of special private interests, which see in such lands opportunities for speculative enterprise. Companies were organized for the purpose of exploiting these lands. These companies seized upon certain statements issued under the approval of the Drainage Division of the Department of Agriculture and circulated them in order to stimulate the sale of these lands before they had been drained. These statements, it appeared, had been made by the official in charge of the field investigations carried on by the department, but had not been critically examined by the authorities of the department. Upon learning of the use to which these statements had been put, the Department of Agriculture held up the report from which they had been taken. As a consequence, there was an immediate protest from the people who were interested in these lands. The investigation of the committee apparently showed that Mr. Wright, the government official, from whom these statements had come, was financially interested in these lands several years ago. Mr. Wright had for some time ceased to be connected with the government service. In regard to the relation which Assistant Secretary Hays held to the affair, the committee was divided. The majority cited facts which appeared to indicate that Mr. Hays knew about the transactions of Mr. Wright, and that he himself, though not profiting financially by any transactions in the lands, took part in the negotiations concerning them. The minority report, on the contrary, defended Mr. Hays, and cited testimony which tended to show that he did not know of Mr. Wright's connection, and that he was in no wise culpable.

As a result of the inquiry made into the matter of the Florida Everglades by the Department of Agriculture, C. G. Elliott, former chief of the drainage investigation in the department, Allison D. Morehouse, assistant chief, Ray P. Teele, formerly assistant chief of irrigation in-

vestigation, and Frank E. Singleton, an accountant, were indicted. The first two had been dismissed by Secretary Wilson, and the third had resigned.

STATE GOVERNMENT, 1912. Governor, P. Trammell; Secretary of State, H. C. Crawford; Treasurer, J. C. Luning; Comptroller, W. V. Knott; Attorney-General, Park M. Trammell; Auditor, Ernest Amos; Adjutant-General, J. C. R. Foster; Superintendent of Public Instruction, W. N. Sheats; Commissioner of Agriculture, W. A. McRea—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, J. B. Whitfield; Justices W. A. Hocker, R. F. Taylor, T. M. Shackelford, and R. S. Cockrell; Clerk, Milton H. Mabry—all Democrats.

STATE LEGISLATURE, 1913. The legislature is: Senate, Democrats, 32; House, Democrats, 71.

The representatives in Congress will be found in the section *Congress*, article **UNITED STATES**.

FLORIDA, UNIVERSITY OF. A State institution of higher learning at Gainesville, Fla., founded in 1905. The registration in the several departments of the university in 1911-12 was 302. The faculty numbered about 60. During the year a gift of \$1500 was received from the general education board for a chair of secondary education, and \$2750 was given by the southern education board for the chair of elementary education. The Southern Railway gave a scholarship of \$200 to the college of agriculture. There has been received from the Peabody Board of Trust, \$40,000, for a building to be known as the George Peabody Hall for the Department of Education. This building is now in process of erection. The State legislature of 1912 appropriated \$105,000 for permanent improvements. Out of this fund there have been constructed the following buildings: college of agriculture, language and history building for the college of liberal arts, and the university commons. The sum of \$6000 has been expended on the university library, bringing the total number of books on file up to about 30,000 volumes. President, A. A. Murphree, LL. D.

FLOUR. See **FOOD AND NUTRITION**.

FLY. See **ENTOMOLOGY**.

FLYING PAY. See **NAVAL PROGRESS, AVIATION**.

FOOD AND NUTRITION. FOOD INSPECTION. A total of 1459 violations of the United States Food and Drugs Act of 1906 were reported for prosecution in 1912, an increase of 25 per cent. over the previous year. Of these 991 were criminal cases. The first jail sentences for violation of the act were inflicted, and there was a tendency on the part of the courts to impose larger fines for first offenses. Decrees of forfeiture and condemnation were entered against 294 shipments of adulterated and misbranded foods and drugs, and 103 shipments of filthy or decomposed products were destroyed.

The Referee Board of Consulting Scientific Experts, popularly known as the Remsen board, submitted their conclusions as to the use of copper salts in the greening of vegetables, finding that the consumption of even small quantities of copper may have a deleterious action and must be considered injurious to health. The use of copper salts in foods under the jurisdiction of the act was thereupon prohibited after January 1, 1913. Other decisions were also promulgated by the Department of Agriculture, authorizing the use of saccharin, previously prohibited in foods, as a drug if prop-

erly labeled, prohibiting the sale of absinthe, restricting the use of the terms sweet oil, maraschino cherries, and candied citron, prescribing the labeling of vinegars, and limiting the amount of liquids and other extraneous material in canned goods.

An amendment to the Food and Drugs Act, adopted August 23, specifically extended its scope to claims as to the curative or therapeutic effect of drugs and medicines.

The resignation of Dr. H. W. Wiley, who as chief chemist of the Department of Agriculture had been prominently associated with the passage and enforcement of pure-food legislation, occurred in April, and was followed late in December by the appointment of Dr. Carl L. Alsberg, a scientist of the department, as his successor.

A pure-food law was enacted by the new State of Arizona. This leaves New Mexico as the only State without such a law, although in Arkansas, Delaware, and West Virginia no special appropriations are available. Additional legislation relative to the labeling of goods to show the net weight or volume was adopted in New York, and also a law requiring an annual bacteriological inspection of all shellfish grounds as to their sanitary condition.

Cost of Food. Although there were considerable fluctuations in food prices throughout the year the general tendency was still upward. *Bradstreet's* for December showed an average increase of 15 per cent. over the corresponding period in 1902, and 6.2 per cent. over that on December 1, 1911. Breadstuffs were apparently somewhat cheaper, but livestock, fruits, and provisions showed considerable increases. Comprehensive data gathered by the United States Bureau of Labor were in general accord with these findings. Round steak was found to have risen 13.61 per cent., lard 11.3, wheat flour 10.7, eggs 11.8, butter 15.3, and sugar 6 per cent. over the previous year. For the ten years the increases ranged from 8.5 per cent. on sugar to 26.1 per cent. on eggs, 32.9 per cent. on milk, 33.3 per cent. on butter, 39 per cent. on wheat flour, 53.9 per cent. on lard, 84 per cent. on round steak, 86 per cent. on pork chops, and 111.9 per cent. on potatoes.

The high prices and their causes were subjects of much speculation and inquiry, and led to a great diversity of conclusions. Data collected by the United States consular service and others, however, indicated that the problem extended in varying degree to every civilized country, and while complex in many of its phases was the result in part at least of progress toward a higher plane of living. Such remedies as were attempted in this country aimed usually either to increase the production of foodstuffs and other raw materials or to effect economies in the distribution of commodities. The establishment of public market places for the direct sale of farm products met with favor in many localities, and there was also much interest in the formation of coöperative associations both for selling and purchasing goods, such as have been quite successful in European countries. Late in December women's clubs and similar organizations in Philadelphia, Chicago, New York, and other cities, were holding special sales of eggs and other foodstuffs in the hope of effecting reductions in prices.

NUTRITION STUDIES. Many of the principal studies of the year dealt with problems connected with the more effective utilization of

food products and the preservation of quality in perishable goods. For instance, corn meal and Kafir-corn meal were tested with reference to a wider use as human food, and it was found that the latter could readily replace half the wheat flour in many recipes. Bacteriological studies of dried and frozen eggs showed the need of strict compliance with sanitary methods in their manufacture, but that when properly handled these products are both wholesome and valuable.

An exhaustive study of cold-storage methods by a Massachusetts State commission revealed many benefits from the practice, in spite of the slow but inevitable deterioration in quality noted. The commission recommended a systematic inspection of warehouses, the prohibition of storage for more than one year or the restorage of goods, and the labeling of all storage products.

Much attention was given to the canning and preserving of foods. Cinnamon and cloves were found to have considerable preservative action, whereas pepper and ginger had very little. The practice of partially filling cans with food and then adding water was shown to be needless, and it was demonstrated that with most food products substantial uniformity in the weights of canned and package goods were readily attainable. The action of canned goods on tin containers was found in the case of shrimps, asparagus, spinach, string beans, and pumpkins to be due to the presence of volatile alkalis or amino acids.

The relation of foods to certain diseases was another leading subject of inquiry. Nelson, of the New Jersey experiment stations, reported that the floating or "fattening" of oysters in brackish water possessed the advantages of ridding the oysters of much of the mechanically entangled slime and other dirt and improved the keeping and cooking qualities, and concluded that the practice is not injurious, but even desirable if the water in which the oysters are floated is pure. On the other hand, Stiles, of the United States Department of Agriculture, found that epidemics of typhoid fever due to the ingestion of polluted sea food were in most cases traceable to floating in polluted waters, and many oyster sections showing sewage contamination were closed by State authorities during the year. A third investigator reported good results by floating oysters in an artificial sea water.

Studies as to the danger of transmitting typhoid fever by green vegetables showed that rainfall alone did not wholly free plants from infected material, and that the typhoid bacillus could survive even unfavorable conditions long enough for such crops as lettuce and radish to mature. Legislation was recommended to prohibit the sale of these products from farms unprovided with proper sanitary facilities.

Additional evidence was adduced to show the relationship between the excessive use of polished rice and such diseases as beriberi and polyneuritis. A substance named "torulin," which seemed to prevent polyneuritis, was isolated from a number of foodstuffs, and in the Philippine Islands the substitution of vegetables for a part of the polished rice in the diet reduced the attacks of beriberi (q. v.). Such data as were accumulated during the year tended to cast doubt on the theory as to the connection of pellagra with the use of corn. The claim that breads, especially white bread,

tend to cause dental caries was found to be true only as regards farinaceous foods in general.

Numerous studies of the proteins were reported, particularly as to their utilization by the body. The proteins from legumes and cotton-seed were found to be much less completely utilized than those of cereals, and those of meat powders slightly less so than those of fresh meat.

The principal scientific gathering of the year was the Fifteenth Congress of Hygiene and Demography, held at Washington, D. C., September 23-28, with President Taft as honorary president. One of its nine sections was devoted especially to the hygiene of food production, distribution, and consumption, and the extensive exhibits assembled in connection with the congress included a large amount of illustrative material along these lines. The Graduate School of Home Economics held its fourth session July 1-26, at the Michigan Agricultural College, in close affiliation with the Graduate School of Agriculture.

BOOKS OF THE YEAR. Some of the more important books to appear in 1912 were the following: W. H. Jordan, *Principles of Human Nutrition—A Study in Practical Dietetics* (New York); E. A. Locke, *Food Values—Practical Tables for Use in Private Practice and Public Institutions* (New York and London); E. Braun, *Economy and System in the Bakery* (Cincinnati); J. A. Murray, *The Economy of Food* (London); G. Reymann, *Dietetische Kost Vorschriften, zum Gebrauch in gesunden und kranken Tagen* (Lauterecken); W. Tibbles, *Foods—Their Origin, Composition and Manufacture* (London); E. P. Cathcart, *The Physiology of Protein Metabolism* (New York, Bombay, and Calcutta); and P. G. Stiles, *Nutritional Physiology*. See CARNEGIE INSTITUTION.

FOOD RIOTS. See PRICES.

FOOT AND MOUTH DISEASE. See VETERINARY SCIENCE.

FOOTBALL. A number of radical changes in the rules, which seem, in the main, to have had the effect of improving materially the game, made the football season of 1912 a conspicuous one. The most important of these changes were: (1) The shortening of the actual playing field from 110 yards to 100 yards, and the addition of two end zones behind the goal posts, each zone 10 yards in length and the width of the playing field, in which zones the forward pass could be executed legitimately; (2) the abolition of the onside kick; (3) the shortening of the intermission between the first and second and the third and fourth periods; (4) the changing of the value of a touchdown from 5 points to 6 points, thus making a touchdown converted into a goal count 7 points instead of 6 as formerly; and (5) giving the attacking team four downs instead of three to gain the ten yards required to retain possession of the ball. Another and even more radical change—that of widening the playing field from its present 160 feet to 210 feet—was considered by the rules committee, but rejected for the reason that there would not be space for a field of such width within the stadiums already constructed.

Not only were there fewer casualties in the football season of 1912 than in any season since 1901, but such casualties as there were were confined almost entirely to games in which the contesting teams were of inferior rank and inadequate condition. No serious accident marred the meetings of the higher class elevens—a

happy condition which must be ascribed, in part at least, to the changes in the rules.

The Harvard University eleven, containing fine material, and splendidly coached in the new game, was the undisputed leader of the season, to Princeton, the champion of the previous year, second place was ascribed, and Yale was placed third. There was very little question of the preëminence of these three teams, but a number of surprises made the ranking of the other elevens more difficult. Dartmouth had an excellent eleven, holding Harvard to a 0-3 score, and sustaining its only bad defeat at the hands of Princeton. The unexpected reverse that Carlisle met at the hands of Pennsylvania stamps the Indian team as having been below the class of the leaders. The University of Pennsylvania had one of those in-and-out elevens which seem to be becoming a habit at that institution, losing by small scores to Swarthmore and Lafayette, and being badly beaten by Brown and Penn State. Of all the elevens in the East, Penn State is the hardest to rank. The team went through the season of 1912 without being defeated or tied, and was scored on only once. But it met no opponent of the caliber of Harvard, Princeton, or Yale. Cornell's season was even more disastrous than Pennsylvania's, the Ithaca eleven losing seven games and winning but three. A southern contestant of promise and achievement was Vanderbilt, which rolled up an impressive point total, and coming north to play Harvard, met honorable defeat, holding the 1912 leaders to a small score.

None of the Middle Western elevens showed anything like impressive strength. Michigan played three games against eastern opponents, losing to the weak Syracuse and Pennsylvania elevens by close scores, and winning from the still weaker Cornell eleven. As an indication of comparative sectional strength, it may be noted that Syracuse, victor over Michigan by a score of 18-7, was beaten by Princeton 65-0. In the Middle Western Conference League Wisconsin was first with five victories and no defeats, and Chicago second with six victories and one defeat.

The results from the principal games played in the East follow: Harvard defeated Princeton 16-6, Yale 20-0, Brown 30-10, and Dartmouth 3-0. Princeton, losing to Harvard, tied Yale 6-6, and defeated Dartmouth 22-7. Yale, beaten by Harvard, and emphatically outplayed by Princeton, despite the tie score, won from Brown 10-0. Pennsylvania, as usual, won her Thanksgiving Day game with Cornell 7-2, and in the annual contest between the services, Annapolis won from West Point for the third consecutive year.

While the much-discussed "All American" eleven is to a large extent a matter of personal choice, a consensus of the selections of some thirty critics of the game picks out the following men as the best in their positions in the East for the season of 1912: Ends, Bomeisler (Yale) and Felton (Harvard); tackles, Storer (Harvard) and Englehorn (Dartmouth); guards, Shenk (Princeton) and Brown (Navy); centre, Ketcham (Yale); quarter-back, Pazzetti (Lehigh); half-backs, Brickley (Harvard) and Baker (Princeton); full-back, Thorpe (Carlisle).

The championship of the Intercollegiate Soccer League was won by Yale, which went through its season with five victories and no defeats.

Pennsylvania, Harvard and Haverford were tied for second place, and Columbia and Cornell were respectively fifth and sixth. The winners in other American Soccer leagues were: New York District League, Newark; New Jersey League, West Hudson; Metropolitan District Association, St. George; Connecticut League, Park City; Southern California League, Rangers; Northwestern League, Black Diamonds. The annual match between Leland Stanford University and the University of California was won by the former by a score of 4-2; and in England Cambridge defeated Oxford by 3 goals to 1.

FORAGE DAY. See the article on AGRICULTURE.

FORD, ISAAC NELSON. An American newspaper correspondent, died August 9, 1912. He was born in Buffalo, N. Y., in 1848, and graduated from Brown University in 1870. He entered journalism by joining the staff of the New York Tribune in 1870, and remained in the service of that journal as office editor, editorial writer, book reviewer, and correspondent until the time of his death. He made many journeys in Canada, the United States, the West Indies, Mexico, and Central and South America. In 1895 he became London correspondent of the New York Tribune, and in this capacity traveled extensively throughout Europe. He was the author of *Tropical America* (1893), and a contributor to magazines and periodicals.

FOREST FIRES. See FORESTRY; FIRE PROTECTION.

FORESTRY. The coöperative plan entered into by the United States Forest Service and various State authorities for the control of forest fires has worked out very successfully, and the country has been spared the heavy loss of life and property that characterized 1910. The lumber manufacturers of Montana, Idaho, Oregon, Washington, and California are also coöperating in preserving the forests from fire. Only about 76,000,000 feet of standing timber is reported as destroyed by fire in the northwest during 1912. Extensive forest fires swept parts of the Yukon Valley, Alaska, early in the summer, destroying much timber. On the Colorado plateau considerable loss is reported. Investigations by the forest service seem to indicate that lightning plays a much greater part in causing forest fires than had hitherto been believed. By recent legislation, the railroads in western Canada are held responsible for fires starting within 300 yards of their right of way, and must assume costs and damages for losses to a distance of 10 miles, when fires spread from their lands. In British Columbia, every owner of forest land is obliged to pay 1½ cents per acre and 2½ cents per thousand feet of timber, and the crown lands contribute 2 cents per acre, to a fund which the government supplements by like amounts to be used for fire protection.

For the year ending June 30, 1912, the exports of forest products of all kinds from the United States were valued at \$108,083,382, while the imports for the same period amounted to \$172,611,580, a gain of \$5,000,000 in exports and \$10,000,000 in imports. Of the imports, rubber was the principal item, valued at \$102,941,901, followed by lumber and other forms of wood, including pulp wood, \$34,664,114, and wood pulp, \$14,218,922. The lumber production for the United States for 1911, according to the United States Census, was 37,003,207,000 feet board measure, a reduction of little more

than 3,000,000,000 feet from the production of 1910. Of the 1911 production, 78.1 per cent. was of soft woods and 21.9 per cent. hard woods. Washington led in its timber cut, with 4,064,754,000 feet, followed by Louisiana, with 3,556,456,000 feet, and Mississippi, with 2,041,615,000 feet. The following additional States each contributed more than a billion feet to the total output: Oregon, North Carolina, Arkansas, Wisconsin, Texas, Minnesota, Michigan, West Virginia, Virginia, Alabama, California, and Pennsylvania. The combined output of lumber of the southern States in 1911 amounted to 68 per cent. of the total. North Dakota is the only State not reporting any lumber production. The output of lath and shingles for the same period was: lath, 2,971,110,000; shingles, 12,113,867,000.

NATIONAL FOREST SERVICE. The exterior boundaries of the National Forests have assumed a fairly stable condition. There were, on June 30, 1912, 163 National Forests, whose gross area embraced 187,406,376 acres, the additions during the year being 238,384 acres, and the eliminations 3,440,251 acres, a net reduction of 3,201,867 acres. Within these forest areas are 22,379,213 acres of alienated land, leaving as the net area of all National Forests, on June 30, 1912, 165,027,163 acres. The distribution of the net area by States was as follows:

State, etc.	Net area Acres	State, etc.	Net area Acres
Arizona	12,462,257	New Mexico..	8,819,408
Arkansas	1,208,782	North Dakota	6,414
California	20,890,945	Oklahoma ...	61,480
Colorado	13,277,374	Oregon	13,658,679
Florida	308,410	South Dakota	1,156,884
Idaho	17,977,454	Utah	7,287,716
Kansas	155,736	Washington...	9,836,146
Michigan	84,711	Wyoming	8,369,023
Minnesota	846,627	Alaska	26,643,263
Montana	16,127,358	Porto Rico....	32,976
Nebraska	520,905		
Nevada	5,294,619	Total	165,027,163

A plan for the exchange of school lands lying within the National Forests for lands of equal area or value elsewhere has been perfected, and applications are pending for the exchange of land held by individuals and companies on a basis of equal value. The systematic classification of agricultural lands within the National Forests begun in 1900, was greatly extended in 1912, work being in progress in four of the six forest districts, the United States Bureau of Soils coöperating. The cost of administration, protection, and permanent improvements in the National Forests for 1912 was \$5,217,827.51, or a trifle over 2½ cents per acre. The receipts were: timber sold, \$1,089,702.04; grazing, \$968,842.26; and special uses, \$98,812.27; with a total of all receipts of \$2,109,256.91, an increase of \$140,263.49 over those of 1911. The free use of timber on National Forests to the value of \$106,335.41 was permitted.

The Weeks law, by which forest areas are to be secured in the Appalachian and White mountains, has been in force for a year, and by purchase or condemnation, 257,228 acres were in process of acquisition, at an average price of \$5.95 per acre. The first purchase in the White Mountains under this law was authorized June 19, 1912, when 30,365 acres were accepted, the Geological Survey having favorably reported upon their desirability for protection of the streams in that region.

The reforestation work of the Forest Service has been continued, and tentative plans have been adopted for the direct seeding or planting of 30,000 acres in the different National Forests each year. Extensive operations in seed collection and nursery work have been carried on to supply the necessary materials. An investigation of the fire-killed timber in Idaho and Montana showed that fire-killed Douglas fir timber was almost if not quite as strong as that of the same grade cut from the live tree. An experiment station has been established in the Manti forest, Utah, for the study of problems of grazing and water run-off, especially in relation to heavy storms. The investigations of forest products and wood utilization have been considerably extended at the laboratories at Madison, Wis., and Chicago, Ill. Track tests in progress since 1902 have shown that, almost without exception, treating ties increases their durability 2 or 3 times. Wood distillation and tapping experiments with western pines have been extensively carried on, and it has been found that the yellow pine of Arizona and California yields a product that readily serves the purposes for which ordinary turpentine is used.

LEGISLATION, ETC. A recent compilation has shown that 14 States have enacted special legislation regarding taxation, forest management, etc., while in 34 States such lands are taxed the same as other property. By a recent law, New York exempts from taxation for 35 years, all tracts of 1 to 100 acres planted to forest trees at the rate of 800 per acre. In Minnesota 30,000 acres of prairie land have been planted to forest trees under the law granting a bounty for such plantings. The Pennsylvania Forestry Commission set out more than 2,000,000 seedlings during 1912. The State forest reserves of Pennsylvania now include over 985,000 acres. Massachusetts has begun the reforestation of the Little River and Ludlow watersheds. Wisconsin added about 36,000 acres to its State forests, the total area of which, in 1912, was about 400,000 acres. San Diego, Cal., is said to own 7000 acres of land which is being planted according to a definite forest plan. Twelve counties in Indiana have organized for the care and planting of forest trees. The chestnut bark blight disease continues to spread and is now known to occur in 10 States, from Massachusetts to Virginia. The International Paper Company, which is said to control 147,000 acres in New Hampshire and Vermont, has adopted a cutting plan of 0.2 cord per acre, which is about the amount of the natural regeneration. In Hawaii a rubber plantation expected to tap 40,000 planted trees in 1912, and a yield of 6000 pounds of rubber is estimated. The governor of Hawaii, by proclamation, has added to a number of the forest reserves in those islands, and the Molokai Reserve of 44,674 acres was created.

FOREIGN COUNTRIES. An English association for the encouragement of forestry was formed within the year, and an advisory committee on forestry in Scotland has been appointed. Recent reports show that about 18 per cent. of the area of Belgium is in forest as follows: state 76,000 acres, municipalities, 411,000 acres; other public institutions, 518,800 acres, and private holdings, 818,350 acres. About 8 per cent. of the area of Holland is in forests, an increase of nearly one-third in the past 30 years. The state forests comprise about 200,000 acres. The forest area of Germany is

said to be 34,500,000 acres, or about 27 per cent. of the area of the country. From the Prussian forest domain a net revenue of \$5 per acre is estimated. In Baden the net revenue for wood alone is said to have been \$7.40 per acre in 1909. The state forests of Bavaria, which comprise 2,150,000 acres, are valued at \$50 per acre, and the net revenue for 1911 was \$3,222,145. Sweden is said to have 72,800,000 acres in forest, 78.2 per cent. of which is privately owned and 21.8 per cent. state forest. The maximum production of forest products of Sweden was reached in 1900, since which time there has been a rapid decline. Experiments in Sweden have shown that burning over heath lands had a favorable effect in reforestation, as less seed was required to get a good stand. Recent reports state that there are in Asiatic Russia, 1,363,240 square miles in forest, and in European Russia, 461,375 square miles, or a total of 35 per cent. of the total land area of the empire. An attempt is being made to develop the forest resources in the Ural Mountains, by the construction of railroads and introduction of modern methods of forestry. In Italy legislation has been recently enacted creating an independent administration of the state forests, providing for reforestation and proper forest management. Newly planted areas are exempt from taxation for 15 years if in coppice and 40 years if high forest. The teak forests of Siam produced for export in 1911 timber valued at \$2,820,914. The minister of finance of Japan reports for 1911 a total area in forests of 51,900,000 acres, about half of which are state forests. The timbered area of Sakhalin is estimated at 8,500,000 acres, and that of Formosa at 12,000,000 acres. An extensive experiment in reforesting the bare hills near Port Arthur in Manchuria has been begun. In 1910 an attempt was made to develop forest management in Siberia, and 21 districts with 57 officials were created to look after a forest area estimated at 500,000,000 acres. Queensland, Australia, has about 4,000,000 acres in forest reserves and about 40,000,000 acres that have not been fully examined. An immediate revision of the forestry laws of Chile is contemplated.

FORESTRY SCHOOLS, PERSONNEL, ETC. The committee appointed in 1911 by the conference of forest schools has reported upon the standardization of instruction in forestry in the United States, and outlined a course of higher grade instruction, requirements for admission, etc. Their report says that there are 24 institutions in this country that give courses leading to a degree in forestry, and about 40 others which include forestry in their courses of instruction. A State college of forestry has been established in connection with Syracuse University, New York, and Dr. H. P. Baker appointed dean. The department of forestry at Cornell has been considerably extended and courses are now offered leading to degrees. Walter Mulford and S. N. Spring have been added to the faculty, and appropriations were made of \$100,000 for a forestry building. A forestry department has been provided for in the University of Idaho through the coöperation of the lumber and timber interests in the State. The Washington School of Forestry has added a course in logging engineering. The Yale School of Forestry has secured a tract of pine forest in New Hampshire to be used for teaching silviculture and forest operations. The Harvard Forest School possesses over 2000 acres

of timbered land that it proposes using as a working laboratory. E. A. Sterling, for several years forester of the Pennsylvania Railroad, and F. G. Miller, dean of the College of Forestry of the University of Washington, have resigned to engage in commercial work. Dr. H. Stotzer, director of the Forest Academy at Eisenach, and Dr. J. L. von Liburnau, through whose efforts the Austrian Experiment Station was founded, have died.

Among the recent books treating of some phases of forestry may be mentioned: S. B. Elliott, *Important Timber Trees of the United States*; C. O. Hanson, *Forestry for Woodmen*; R. C. Hawley and A. F. Hawes, *Forestry in New England*; J. Nisbet, *The Elements of British Forestry*; W. Noyes, *Wood and Forest*; S. J. Record, *Economic Woods of the United States*; C. K. Schneider, *Illustriertes Handbuch der Laubholzkunde*.

FORMOSA, or TAIWAN. An island off the Chinese coast, a dependency of Japan. Capital, Dai-Hoku (or Tai-pei). Area, 2324 square ri (13,841 square miles). Legal population December 31, 1908, 2,984,590; total estimated population in 1912, 3,443,679 (1,806,048 male, 1,637,631 female). Estimated resident population of the larger towns December 31, 1910: Dai-Hoku, 91,309; Dainan (Tainan), 57,622; Kagi (Chia-i), 22,218; Rokko (Lu-Kong), 19,036; Kiilung (Keelung), 17,110; Shinchiku (Hsin-Chu), 16,064; Gilan (Ilan), 15,803; Shokwa (Chang-Hua), 15,506; Taku (Takow), 12,161; Daichiu (Taichu), 11,296; Toko (Ton-kong), 10,178. The census of 1905 showed that 97.62 per cent. of the inhabitants in the administrative area were illiterate, but the Japanese are developing an educational system.

The agricultural products include rice, tea, sugar, sweet potatoes, ramie, and jute. Camphor is worked in the forests as a government monopoly. The mineral products include gold, coal, silver, copper, sulphur, and petroleum. Gold production in 1908 and 1909, 51,778 and 50,811 ounces; silver, 32,791 and 49,813 ounces; copper, 86,347 and 115,671 kwan; sulphur, 525,017 and 576,632 kwan; coal, 151,887 and 180,515 tons. Exclusive of the large trade with Japan, imports and exports of merchandise were valued in 1910 at 19,853,000 and 12,080 yen respectively; in 1911, 19,555,000 and 13,176,000. Railways, 467 kilometers (290 miles); telegraphs, 2283 kms. of line and 5591 kms. of wire; telephones, 1107 kms. of line and 12,210 kms. of wire; post offices, 135. Revenue and expenditure (provisional accounts) amounted to 55,338,350 and 41,201,533 yen respectively in the fiscal year 1911. The budget for the fiscal year 1912 balanced at 43,651,651 yen; for 1913, 45,325,508 yen. Formosa is administered by a governor-general (in 1912, Lieut.-Gen. Count Sakuma Samata).

FORTIFIED WINES. See LIQUORS.

FOSTER, DAVID JOHNSON. Former congressman from Vermont, died March 21, 1912. He was born in Barnet, Vt., in 1807, and graduated from Dartmouth College in 1880. He studied law and was admitted to the bar in 1883. Beginning practice in Burlington, he was elected State's attorney in 1886, serving until 1890. From 1892 to 1894 he was a member of the State Senate and from 1894 to 1898 was commissioner of State taxes. He was elected to the Fifty-seventh Congress in 1901 and was reelected to the succeeding congresses, including the Sixty-first.

FOUNDATIONS. The use of the freezing process which has been applied in various kinds of excavation where a damp and loose subsoil was encountered was described during the year, in its application to a building foundation, the method consisting of excavating within a sheet-pile enclosure by sinking freezing pipes five inches in diameter vertically around the site of the excavation. These pipes were sunk to a distance of 23 feet below the bottom of the proposed excavation, and were connected with brine pipes and a refrigerating plant. By freezing the material excavation was possible so that the material and moisture and water in the centre could be removed and the floor covered with a thick bed of concrete placed under water. The frozen material prevented the water entering the excavation, and the site was pumped out and the side walls were completed.

One of the most important foundations of the year was that of the new Adams Express Company building in New York, in which pneumatic caissons were used, set, sunk, and concreted by the aid of locomotive cranes. This building, 32 stories in height and of 202 x 107 feet area, is supported on 24 piers sunk through quicksand, gravel, and hard pan to rock at a maximum depth of about 70 feet below the Broadway curb. Rectangular wooden caissons varying from 9½ x 9½ to 9 x 34 feet were employed. The use of the cranes presented features of interest and was attended with great success. See also BRIDGES and TALL BUILDINGS.

FOURTH OF JULY ACCIDENTS. See TETANUS.

FRANCE. A republic in western Europe. Area and population by departments below. Capital, Paris.

AREA AND POPULATION. According to the census of March 5, 1911, the area in hectares was 53,846,374 hectares, which is equivalent to 536,464 sq. kilometers, or 207,129 sq. miles. The area as calculated in 1901 excludes the foreshore, the estuaries, and certain barren regions, and amounts to 52,944,198 hectares. The population was 39,601,509.

Marriages in 1911, provisional figures, 307,788 (307,710 in 1910); divorces, 13,058 (12,975); living births, 742,114 (774,399); stillbirths, 33,840 (36,009); deaths, 776,983 (702,972)—an excess of 71,418 births over deaths in 1910 and a deficit in 1911 of 34,869.

Some of the principal cities with their communal population in 1911: Paris, 2,888,110; Marseilles, 550,619; Lyons, 523,796; Bordeaux, 261,678; Lille, 217,807; Toulouse, 149,576; Saint-Etienne, 148,656; Nice, 142,940; Nantes, 170,535; Le Havre, 139,159; Rouen, 124,987; Nancy, 119,949; Reims, 115,178; Toulon, 104,582; Amiens, 93,207; Limoges, 92,181; Brest, 90,540; Nîmes, 80,437; Dijon, 76,847; Orléans, 72,096; Tours, 73,398; Versailles, 60,458; Avignon, 49,304; Cherbourg, 43,731; Angoulême, 38,211; Rochefort, 35,019; Saint-Nazaire, 38,267; Pau, 37,149.

EDUCATION. In 1911 the conscription list carried 301,467 men of the class of 1910. Degree of instruction of 18,093 of these, unknown. Of the other 283,374, 2.79 per cent. could neither read nor write, 1.31 per cent. could read only, 27.44 per cent. could read and write; 65.98 per cent. had acquired a more extensive primary education, and 2.30 per cent. were graduates of secondary institutions.

Infant schools (1910-11), 3967 (2691 public and 1156 private lay schools, and 10 public and

110 private clerical schools); total teachers, 8615 (219 clerical). Children in lay schools, 603,747; in clerical schools, 17,175—total, 620,922 (315,822 boys, 305,100 girls). Primary schools, including superior primary schools (1910-11), 82,488 (619 clerical); teachers, 156,981 (2055 clerical); pupils, 5,654,794 (5,579,502 in lay and 75,292 in clerical schools). Primary normal schools (1910-11), 166 (166 in 1911-12); teachers, 1720 (1726); students, 9326 (9358). State expenditure for primary instruction (1909), 212,608,176 francs.

Secondary public schools (1911-12): 344 lycées and colleges for boys (97,512 students) and 129 for girls (30,788); 56 secondary courses for girls (5503 pupils). Students in universities January 15, 1912, 41,194.

AGRICULTURE. Of the productive area (1909), 23,615,220 hectares were under crops (including sown meadows), 4,837,610 under natural meadows, 1,577,220 under forage plants, 3,627,330 under pasture, 1,686,942 under vines, 1,220,150 under industrial plants, truck gardens, etc., 9,329,193 under woods and forests; 3,843,520 hectares were fallow or uncultivated; 3,218,579 not included in any of the foregoing. The leading crops, with their area (in hectares) and yield (in quintals) for 1911 and 1912 (the latter subject to slight revision) and the yield per hectare in 1911, are as follows:

	Hectares		Quintals		Qs.
	1911	1912	1911	1912	ha.
Wheat	6,443,360	6,555,500	87,727,100	91,182,600	13.6
Rye	1,174,420	1,211,865	11,875,000	13,039,000	10.1
Barley	771,935	751,150	10,856,570	11,381,340	14.1
Oats	3,991,490	3,997,250	50,693,500	54,519,700	12.7
Flax*	24,028	22,355	126,079a	5.2
Beetst	242,930	245,385	42,357,640	63,841,100	174.4
Vinest	1,683,113	1,678,941	44,885,500	59,339,035	26.7
Tobacco*	15,937	4,036	183,404	11.5

* In the principal producing departments. † Sugar beets. ‡ In the important producing departments. Production above given in hectoliters. a Seed.

Other important crops (1910): Potatoes, 1,546,990 hectares, 85,230,900 quintals, value 885,074,670 francs; dry beans, 122,370 ha., 1,275,720 qs., 52,673,870 fr.; forage beets, 665,460 ha., 214,094,450 qs., 404,829,590 fr.; truck-garden products, 111,070 ha., 203,820,050 fr. Quintals of corn produced (1911), 4,283,000. In 1912, 33,133 hectograms of silk-worm eggs were placed to be hatched, against 35,431 hectograms in 1911. The cocoons obtained amounted to 6,233,942 kilograms, against 5,109,426 in 1911. Average yield of cocoons per hectogram of eggs, 188.1 kg. (144.2 in 1911.) Livestock statistics follow (December 31):

	1910	1911	*
Horses	3,197,720	3,236,110	+ 38,390
Mules	192,740	194,040	+ 1,300
Donkeys	360,710	360,950	+ 240
Cattle	14,532,030	14,552,430	+ 20,400
Sheep	17,110,760	16,425,330	-685,430
Goats	1,417,710	1,424,180	+ 6,470
Pigs	6,900,230	6,719,570	-180,660

* Increase + or decrease —.

For notes on agricultural education in France, see AGRICULTURE EDUCATION.

MINING, ETC. The kind and number of mines in operation in 1909, the number of workers employed, the production in metric tons, and the value in francs, are shown below in first

part of table; in second part, metal works in operation, workers, production, and value:

Ores	No.	Workers	Tons	Francs
Coal and Anthr.	296	187,242	37,115,891	568,726,505
Lignite		3,506	724,195	7,192,299
Peat	2803	78,593	960,255
Iron	99	17,228	11,889,990	53,117,346
Lead and silver	35	13,794	2,825,855
Zinc	3	50,911	4,537,896
Gold	5	96,903	5,862,347
Copper	3	458	26,384
Iron Pyrites	8	273,221	4,512,996
Manganese	25	7,326	9,378	267,774
Antimony	6	28,105	1,919,913
Arsenic	1	2,141	176,286
Tungsten	1	50	150,000
Tin	1	22	55,500
Bit. schist*	119,721	550,262
As. lime-stone†	84	44,826	652,217
Boghead		4,507	180,250
Sulphur	803	2,936	50,029
Salt (rock)	208	708,806	10,328,643
" (sea)	59	404,255	7,052,569
Quarries	121,686	49,271,000	249,995,000

COMMUNICATIONS. Railways in operation December 31, 1911, 40,632 kilometers of main and 9617 kms. of local line. An important cut-off to shorten the through distance from Paris to Milan was under construction during the year on the line between Frasné and Villorbe, connecting France and Switzerland. This new line, 15½ miles in length, included five tunnels, one of which was 3¾ miles in length. An important project was the conversion of the section of the Midi line between Toulouse and Bayonne with its numerous branches, aggregating some 310 miles, for operation by electricity provided by hydro-electric power plants in the Pyrenees Mountains. Two hundred and seven miles of the lines around Limoges in the department of Haute Vienne were also being electrified, and a beginning was made of the electrification of the suburban lines of the Western State Railway to Auteuil, Versailles, St. Germain, and Argenteuil. The section of the Paris

Nord-Sud line from Porte Clichy to La Fourche was opened in January, 1912. Telegraph lines, 182,794 kms.; wires, 690,636. Urban telephone lines, 43,286 kms.; wires, 858,132; interurban lines, 103,080; wires, 480,650. Post offices (1910), 14,016.

Merchant marine January 1, 1911, 17,621 vessels, of 1,451,648 tons (1726 steamers, of 815,567.)

FINANCE. The monetary unit is the franc, worth 19.3 cents. The 1912 budget as voted estimated the revenue for the year at 4,495,849,566 francs (including revenue returnable from Algeria, 2,480,900 francs); the expenditure at 4,497,963,139 francs. Sources of revenue: 3,136,996,425 from taxes; 953,225,785 from monopolies and state industrial enterprises; 68,218,850 from state domains; 69,441,485 from divers sources (indemnities, repayments, annuities, sales, prison labor, etc.); 153,000,000 from special sources; 114,967,021 *recettes d'ordre* (from colonial railways, fines, fees, etc.); 2,480,000 from Algeria. Expenditure: 1,286,084,002 for the public debt, 19,972,948 for public services, 2,539,705,705 for the ministries, 605,873,584 for costs of administration and collection of taxes, 46,326,900 for reimbursement, restitution, etc. The total public debt stood, January 1, 1911, at 31,162,001,387 francs, and the floating debt at 1,395,898,400.

ARMY. During 1912 there were but few changes in the general organization of the French army, but it was realized that the new German army act was likely to result in a general increase in numbers. By virtue of decrees of January, 1912, the minister of war was assisted by the secretary-general, who, under the minister's authority, was given the supreme direction of the administration of the army, while a council of directors, which includes the secretary-general and the chief of the army general staff, was established. The chief of the general staff (General Joffre) was designated as the officer in command of the principal groups of armies in case of war. The French army is recruited by compulsory service, and men serve two years in the active army, eleven years in the reserve, six years in the territorial army and six years in its reserve. Much interest attached to the annual contingent of recruits due to the declining birth-rate. The contingent of men, which averaged 215,000 in 1896-1905, amounted to 214,449 in 1911. This was for the combatant contingent of the home army and was 15,080 less than in 1910. The French army was expected to furnish on a war footing a first line effective strength of 2,500,000, and with the two classes of the active army and eleven classes of the reserve 2,000,000 more could be placed in the field. On the day of mobilization it was stated an efficient force of nearly 1,400,000 could be assembled, including the standing army and 800,000 men recently discharged and available. The army estimates for 1912 amounted to 940,500,000 francs, the increase being due in large part to an increase of pay in the recent reorganization of the artillery.

The active army continued its organization with twenty army corps exclusive of the garrisons at Paris and Tunis, and headquarters were located at Lille, Amiens, Rouen, Le Mans, Orléans, Chalons-sur-Marne, Besançon, Bourges, Tours, Rennes, Nantes, Limoges, Clermont-Ferrand, Lyons, Marseilles, Montpellier, Toulouse,

Bordeaux, Algiers, and Nancy. The total establishments given in the estimates of 1912 were as follows: Active army, 28,743 officers and 555,900 men; gendarmerie and Republic Guards, 667 officers and 24,265 men; Colonial troops in France, 1047 officers and 25,844 men, making a total of 31,367 officers and 606,009 men. In the active army there were in Algeria and Tunis in 1912, 21,868 officers and 71,147 men. This active army was composed of about 590 battalions of infantry, 30 battalions of chasseurs, 12 foreign, 24 zouaves, 24 Algerian tirailleurs, 1 Saharan tirailleurs, and 5 African light infantry, or an aggregate of about 685 battalions. A law was passed in 1912 increasing the cavalry so that there were to be 32 regiments of dragoons, 23 of chasseurs, 14 of hussars, 12 of cuirassiers, 4 of chasseurs d'Afrique, and 6 of spahis, also 2 squadrons for the Sahara, and squadrons in Senegal, Indo-Chino, and other colonies. The artillery, whose reorganization and rearmament were still in progress, was to comprise 42 coast and 47 fortress batteries, 619 field batteries, 21 Rimailho 6-inch field howitzer batteries, 14 mountain batteries, and 16 horse batteries, in addition to which there were outside of France and Corsica 8 coast, 15 field, and 4 mountain batteries. There were 26 battalions of engineers and 3 railway companies, with other technical corps including aeronautic troops and a military train of 20 squadrons. The French army reserve includes 245 three-battalion regiments of infantry (with a skeleton formation of officers and men) and 30 battalions of chasseurs, 40 regiments of cavalry, 41 squadrons, and 216 batteries. In the territorial army there were 145 infantry regiments, 7 battalions of chasseurs, 42 squadrons, about 100 batteries, 20 battalions of engineers, men of the customs and forest service, zouaves in Algeria, and other troops.

The scheme of service is two years in the active army, eleven years in the reserve, six years in the territorial army, and six years in its reserve. The reservists and territorial troops are called out for periodical training. The strength of the first line of the French army on a war basis was estimated at 2,500,000, with the two classes of the active army and eleven classes of the reserve. Then would come a second line of 2,000,000 more which could be placed in the field. It was estimated that at a time of mobilization a force of 1,400,000 troops could be assembled on an elective basis. See AERONAUTICS.

NAVY. On December 1, 1912, the number and displacement of warships, built and building, of 1500 or more tons, and of torpedo craft of more than 50 tons, were as follows: 7 battleships (dreadnought type), having a main battery of all big guns (11 inches or over in calibre), of 161,644 aggregate tons—all building; 20 battleships (predreadnought type), with main batteries of more than one calibre, of 286,005 tons—built; 2 coast-defense vessels (smaller battleships and monitors), of 15,400 tons—built; 10 cruisers (designed for speed at some expense of armament and armor protection), of 49,978—built; 75 torpedo-boat destroyers, of 29,816 tons—built, and 9, of 6860 tons—building; 157 torpedo boats, of 15,370 tons—built; 76 submarines, of 27,803 tons—built, and 13, of 7456—building. Total vessels built, 361, of 630,769 tons; building, 29, of 175,960 tons—in all, 390 vessels, of 806,729 tons. Excluded from

the foregoing are ships over twenty years old, unless reconstructed and rearmed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, or other auxiliaries. Personnel, 60,188 officers and men. See NAVAL PROGRESS.

A new bill passed February 13, 1912, by the Chamber of Deputies, provides for a home fleet to consist of 28 battleships divided into 4 squadrons each and 4 vessels in reserve; in addition each squadron to include 2 second cruisers and 12 destroyers, with 2 cruisers and 4 destroyers in reserve. The fleet for foreign service is to contain ten principal vessels, with the necessary auxiliaries. There are to be 94 vessels, together with mine-layers and mine-raisers, in the submarine flotilla. To complete this programme by the time fixed (January 1, 1919), 16 new battleships are to be constructed at the rate of two a year (1910-1917). The *Courbet* and the *Jean Bart* (launched 1911, to be completed 1913), the *France* and the *Paris* (launched 1912, to be completed 1914) have 23,100 tons displacement and twelve 12-inch guns. The *Bretagne*, the *Provence*, and the *Lorraine* were laid down in 1912 and are to be completed 1915—two belonging to the regular programme and the third being designed to replace the lost *Liberté*, destroyed by explosion in 1911. The submersible *Vendémiaire* was sunk in a collision June 8, 1912, and her crew lost.

GOVERNMENT. Under the present constitution the president is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a parliament or assembly, composed of a senate and a chamber of deputies. President in 1912, Armand Fallières (elected January 17, 1906). The cabinet, constituted January 12, 1912, was as follows: Raymond Poincaré, premier and minister for foreign affairs; A. Briand, justice; L. L. Klotz, finance; M. Steeg, interior; M. Millerand, war; M. Delcassé, marine; M. Guist'hau, instruction, etc.; J. Dupuy, public works, etc.; F. David, commerce and industry; M. Pams, agriculture; M. Lebrun, colonies; L. Bourgeois, labor, etc.

HISTORY

ATTACKS ON THE CAILLAUX MINISTRY. Parliament was deeply absorbed during the closing weeks of 1911 and the early part of 1912 in a discussion of the history of the Franco-German negotiations which had resulted in a French protectorate over Morocco at the expense of a large part of the French Congo. The bargain was condemned by French public men as requiring too heavy a compensation from France. From the report of the investigation made by the French Senate, it appeared that M. Cambon in negotiating with the German foreign minister received instructions that had not come to the knowledge of the French foreign minister or formed the subject of deliberation at a ministerial council. This created a very painful impression on the public mind. There were other signs of weakness in the ministerial majority. It was criticised for its inertia, and many believed that unless it dealt vigorously with important measures like electoral reform, national insurance, and the income tax it would lose the little prestige that remained to it. But the chief point against it was this belief that the prime minister, by underhand dealings with German officials during the Moroccan negotiations, had prejudiced French official diplomacy. Sen-

Premier, 1912

1780

sational charges to this effect were made by the French press, which alleged that M. Caillaux, while minister of finance, interfered in the French foreign policy by negotiating himself with Germany concerning the Congo-Kamerun railway scheme, independently of the ministry and of the French embassy at Berlin. It was further charged that he, as prime minister, had secretly resumed these negotiations after the incident of Agadir, that he received a representative from Germany without informing the French foreign minister, and that he even agreed in secret to an understanding with Germany on principles that would lead to acquiescence in the loss of Alsace-Lorraine and to the dissolution of the triple accord. The senate committee, though its inquiries did not substantiate these charges in detail, brought out the fact that M. de Selves had not been informed of all the negotiations between Paris and Berlin. When asked the direct question M. de Selves declared that he could not answer because he stood between two duties, the duty of telling the whole truth and the duty of maintaining the solidarity of the ministry. It therefore appeared that while M. de Selves, as foreign minister, and M. Jules Cambon, as ambassador to Berlin, were negotiating with Germany, secret negotiations were at the same time being conducted by the prime minister, M. Caillaux, and others in the government. On January 10, M. Caillaux announced that he would not continue in power, attributing this decision to his difficulty in finding a new minister of marine. The fall of the cabinet, however, was due to dissensions of long standing and arising chiefly from the cause above mentioned.

THE NEW MINISTRY. The formation of the new cabinet was entrusted to M. Raymond Poincaré. It was completed on January 13, and announced the next morning as follows: M. Poincaré, president of the council (prime minister) and minister for foreign affairs; M. Briand, minister of justice and vice-president of the council; M. Steeg, minister of the interior; M. Millerand, minister of war; M. Klotz, minister of finance; M. Delcassé, minister of marine; M. Guist'hau, minister of public instruction; M. Lebrun, minister for the colonies; M. Pams, minister of agriculture; M. Fernand David, minister of commerce; M. Jean Dupuy, minister of public works; M. Bourgeois, minister of labor.

The high intellectual standing and the political experience of the ministers were the subject of much remark. Two of them, M. Léon Bourgeois and M. Briand, had been prime ministers. M. Millerand had made a distinguished record as member of the Waldeck-Rousseau ministry, and M. Delcassé had been for many years the centre of European attention as foreign minister. M. Poincaré was born in 1860 and entered politics in 1887 as a member of the Chamber of Deputies. He served in the first Dupuy cabinet as minister of public instruction, and in the succeeding Dupuy cabinets as finance minister. In the third Ribot ministry he served again as minister of instruction and in the Sarrien cabinet again as minister of finance. He had previously twice declined the office of minister of foreign affairs, which portfolio he now assumed in addition to the premiership. The ministerial declaration of policy was read on January 16. It laid great emphasis on the strong national feelings and aspirations of the government, whose first task was to be the car-

rying through of the treaty with Germany. It declared that this treaty would soon be completed and that without doubt an understanding would be reached with Spain. It announced the government's intention to remain faithful to the alliances and friendships of France, and to cultivate steadily cordial relations with other nations. Progress it declared was essentially "order in motion." The condition precedent of all republican democracy was self-discipline. It next proceeded to the important question of electoral reform, declaring that the last general election had shown the need of far-reaching changes in the electoral system. The government promised to carry a measure of reform that should reflect the aims of the Republican majority and accord with the work done by the parliamentary commission on universal suffrage. The measure would secure a more exact representation for political parties and give those who are elected "the freedom that is required for the subordination of local interests in all cases to the national interests." This plain reference to the proportional representation and the restoration of the *scrutin de liste* was received with enthusiasm by the Chamber as a whole. The government received nearly a unanimous vote of confidence, namely, 440 against 6.

The Senate committee in its report on the Franco-German treaty declared that no other course than the ratification of the treaty was compatible with the interests of France, and referred to the great prestige which had been gained as a result of the negotiations. It further said that recognition of the French protectorate in Morocco would come as the fruition of the government's policy during a period of ten years. The committee's report was adopted by a large majority on January 24. With it was passed a resolution deploring secret treaties and the addition of secret clauses to treaties altering their sense. On February 27 the Chamber by a vote of 541 to 76 finally adopted the budget in the form in which it had left the Senate. On March 30 it passed a bill extending the provisions of the eight-hour law of 1905 to all classes of miners and slate quarrymen.

The senatorial elections of January 7 made little change in the relative strength of the respective groups. The distribution of seats was as follows: Radicals and Radical Socialists, 48; Progressists, 23; Democrats, 20; Conservatives, 5; Socialists, 4.

ELECTORAL REFORM. The Electoral Reform measure offered by the government substituted for the scheme proposed by the universal suffrage committee a plan based on the *scrutin de liste* applying to considerable areas and providing for minority representation. It was the main concern of the parliament for several months. After much discussion and criticism it passed the Chamber on July 12 by a vote of 339 to 217. In effect it was a compromise between proportional representation and the present majority system. Its chief principles were the *scrutin de liste* with minority representation, the electoral quotient in enlarged electoral areas, and the assignment of any remaining seats to the *liste* that contained the largest number of votes. By electoral quotient was meant the number of voters in a department divided by the number of deputies assigned to it. Each *liste*, i. e., party ticket, was to have the number of seats determined by dividing the total vote for the *liste* by the electoral quo-

tient. Vacancies were to be filled by candidates on the same *liste* who had received the largest number of votes in the preceding election. It was to take as the electoral area the *Département*, assigning one seat for every 20,000 French inhabitants, or for fractions over 20,000. The bill thus provided that the number of deputies should rest on the basis of population and not as the committee proposed, on the number of registered electors. It enlarged the electoral basis by grouping departments. The Republican party was divided on the subject, some 200 Radicals opposing the government measure, and looking for a chance to overthrow the ministry by a Socialist alliance. A vigorous campaign was carried on against it after the adjournment, MM. Clemenceau and Combes being the chief opponents. In the Senate the measure was submitted to a committee which in November reported in favor of the *scrutin de liste*, but against the representation of minorities.

MUNICIPAL ELECTIONS. Municipal elections in Paris and the provinces early in May pointed to the growing strength of the Collectivist Socialists. The Moderates and the opposition generally held their own, while the Radicals suffered losses.

THE FRANCO-GERMAN TREATY. The debate on the Franco-German treaty in the Senate began on February 5, on the question whether the Senate committee appointed to investigate the treaty should have power to inquire into the secret negotiations and into any engagements that were unknown to parliament, and to fix the responsibilities which might have been incurred by such negotiations and engagements. In the course of the discussion M. Caillaux was charged with offering certain guarantees as the foundation of a Franco-German *entente*. These guarantees were that France would not oppose henceforth the project of the Bagdad railway; that the shares of that railway company as well as German government stock were to be admitted to quotation on the Bourse; that Germany was to have her turn at the presidency of the Ottoman debt, which was now held alternately by France and England; that nearly all the French Congo was to be ceded to Germany, that a French colony on the Pacific was to be ceded, and that Germany and France were to conclude an agreement concerning European affairs which entailed most serious consequences, among others, the renunciation by France of any claim to a revision of the treaty of Frankfurt of 1871. One of the senators declared that he would not vote for a treaty which filled good Frenchmen with vexation and filled Germans with joy. France contended that the treaty should be passed as a necessity of French foreign policy and protested against the secret negotiations and engagements. As to the session of the French Congo, it was characterized as the first instance of departure by France from her policy of not ceding territory without consulting by plebiscite the persons immediately concerned.

Some of the arguments of prominent French statesmen on the treaty negotiations of 1911 were as follows: M. Pichon held that the French government should not have consented to negotiate so long as the German gunboat *Panther* was at Agadir. It should have trusted to the patriotism of the country which was ready to support it in a firm attitude. He criticised the government also for not associating Great Britain and Spain in the negotiations and he

quoted from the speeches of Sir Edward Grey and Mr. Lloyd-George to prove the firm support that Great Britain was ready to give to France in this emergency. M. Ribot declared that France had a right to establish order in Morocco and that the government should not have acted as if Germany were the only interested power. He regarded the Agadir incident as a sad blunder of German diplomacy from which France ought to have profited. He was loudly applauded when he declared that if he had been minister of foreign affairs at that time he would not have allowed the French ambassador, M. Jules Cambon, to have returned to Berlin while the German gunboat remained at Agadir. M. Clemenceau said he would not vote for a treaty that had been extorted under the guns of German warships and without the participation of the friends of France in the negotiations. He said that to reject the treaty would, to be sure, be a leap in the dark, but that a leap into the unknown was better than a leap into what they knew too well. The treaty which had been adopted on December 20 by the Chamber, was finally adopted by the Senate on February 10 by a vote of 212 to 42.

TREATY WITH MOROCCO. A French commission was sent to Fez to secure from the sultan a treaty recognizing the French protectorate, and the treaty was signed on March 30. It conformed in essential features to the treaty of Bardo with Tunis. It made a special exception of Tangier, and the Spanish sphere whose future administration was to be determined and whose limits were to be fixed later. The sultan was reluctant to exclude this sphere, but M. Regnault, the French commissioner, had received precise instructions to reserve Tangier and the future Spanish sphere from the operation of the treaty.

The text of the treaty was published early in April. It provided that the sultan should not for the future contract, directly or indirectly, any public or private loan or grant any concession without the authorization of the French government. It recognized the right of the French government to occupy any part of Moroccan territory where such occupation was necessary for the maintenance of order or the security of commerce, the sole condition being that the French government should first notify the Maghzen. The French resident-general was to be the sole intermediary between the sultan and the representatives of foreign powers, and French diplomatic and consular agents were charged with the interests of the natives as against foreigners. The treaty provided for the reorganization of the finances and for the support of the sultan in maintaining his authority. It proclaimed freedom of religion.

TREATY WITH SPAIN. A Franco-Spanish commission for the settlement of the Moroccan question was appointed in the latter part of February. The negotiations turned on the reification of the frontiers, the sultan's sovereignty over the Spanish zone, the collection of customs, the control of the Spanish section of the proposed Fez to Tangier railway, and the question of compensation to France out of Spanish territory for her concessions to Germany. France claimed such compensation on the ground that by ceding territory in the Congo to Germany she had virtually raised the German "mortgage" on Morocco, which was prejudicial to the interests of Spain as well as

of France. Spain admitted the principle, and the question turned on the nature and extent of the compensation. After long discussions, in which the friendly offices of Great Britain were sought at intervals, the treaty was prepared at the end of October. Spain ceded the greater part of her southern zone and gained in exchange a large extension of her northern zone to include Mount Ghani, commanding Alcazar. She engaged, however, not to fortify this position. Of the southern zone she retained only the strip of coast on which the town of Ifni was situated. Spain was to retain the collection of customs in her zone, but was to pay an annual sum proportionate thereto toward the liquidation of the Moroccan debt. Other provisions were the internationalization of the Tangier-Fez railway and the choice of the sultan's representative or khalifa from a list submitted by Spain, and the appointment of a Spanish resident general as his coadjutor.

NAVAL POLICY. The new naval programme which had been formed in 1911 was submitted to the Chamber on February 12, and was carried by a vote of 452 to 53. It provided for the construction of 28 battleships by 1920. The general naval policy of France was set forth at that time by M. Delcassé, minister of marine, as aiming at the creation of a strong enough navy to proceed anywhere and to constitute a superior force in those waters in which France had vital interests. At present and for a long time to come the Mediterranean waters are and will remain the most important sea for French naval progress. He said that France should proceed on this principle and not on the principle of any particular number of ships merely because some other power was laying down a similar number.

NAVAL CONCENTRATION. In June the government decided to transfer the Atlantic squadron to the Mediterranean, and on September 10 that decision was definitely announced. M. Delcassé, the minister of marine, ordered the six vessels which constituted the squadron at Brest to sail to Toulon on October 15 and join the Mediterranean fleet. The latter would then comprise 18 battleships and six large armored cruisers. This was explained in the French press as due to the belief that a single powerful fleet was a better protection than divided forces, and that the Brest squadron of six old vessels would be of little use in the Atlantic, but might in the event of war be valuable in the Mediterranean. It was urged that in no sense was it an aggressive movement, but a mere return to the situation of 1909. Nevertheless it was associated in the public mind with the recent increase of the Italian and Austro-Hungarian navies, and in Austria there was bitter comment on it as a proof of an offensive and defensive alliance between France and Great Britain.

THE MOTOR-CAR BANDITS. A succession of atrocious crimes, beginning toward the end of November, 1911, became the subject of excited discussion not only in France, but all over the world, owing to the peculiar methods and the extraordinary boldness of the criminals. On December 21, 1911, a bank messenger was shot and robbed in the Rue Ordener. On February 27, three men in a motor car killed a policeman near the Saint Lazare railway station, while he was trying to stop them, and the motor car was subsequently found half de-

stroyed by fire. On the following night the house of a lawyer at Pontoise was entered by a man who rode up to it in a motor car. During March several attempts were made to break into garages and steal machines. These outrages were followed by a far more serious one on the morning of March 25, when four men held up a motor car near Montgeron, on the road from Paris to Fontainebleau, and killed one of the chauffeurs and wounded the other. The robbers immediately jumped into the car and disappeared. Two hours later they drew up before the bank at Chantilly, on the other side of Paris, nearly 40 miles away from the scene of the first murder. Meanwhile two more men had joined them. Four of the robbers entered the bank and shot and killed the cashier and a clerk and wounded another employee. They seized all the cash, amounting to some 40,000 francs, as well as some securities, leaped into the car, and rode at full speed toward Paris, firing at everyone who tried to stop them or who looked at them too closely. A little more than an hour later, the car having sustained some injury, it was abandoned near Asnières, and the bandits disappeared without leaving any trace. The failure of the police to capture the perpetrators of this series of robberies and murders caused much consternation, and led to a summons of the ministers in council for a discussion of measures to promote the efficiency of the police and detective service.

The band of criminals who had terrorized Paris for a period of six months was at last rounded up on April 28 at a suburb, Choisy-le-Roi, eight or nine miles to the south of the city, where Bonnot, the ringleader of the band, with one of his accomplices, was traced to a motor-car garage. A regular siege was set up by the police and a company of troops, and a fusillade on both sides lasted for four hours, when the building was finally blown up with dynamite. Bonnot was captured alive, but so severely wounded that he died on reaching the hospital. His confederate, Dubois, was found dead in the building. This event followed the murder of the assistant-chief detective, named Jouin, on April 24, by Bonnot, who escaped, and the police suspected that he and some of his confederates were making one of the suburbs their headquarters. Two police officers were wounded in the attack on the garage. Bonnot was born in 1876 of a respectable family, but in youth fell under anarchist influences and was involved subsequently in many strikes. He began a series of robberies in 1909 and finally organized a band of criminals whose movements he directed with uncommon skill and energy. His confederate, Dubois, was a veteran of the French Foreign Legion, who had subsequently taken up the trade of a motor car mechanic.

Another sensational incident occurred on May 14, when the hiding place of two other members of the band of criminals, Garnier and Vallet, at Nogent-sur-Marne was stormed by soldiers and police under the chief of police, M. Guichard. The attack was begun on the night of May 14 and lasted until early morning, when, as in the previous instance, the house was shattered by an explosive and the officers of law rushed in. Both criminals were killed.

MISCELLANEOUS. To the long list of naval disasters in recent years was added another serious accident on June 8, when a submarine

was run down by a battleship near Cherbourg, causing the loss of the crew of 23 men and two officers. In consequence of anti-militarist declarations at the annual congress of the Teachers' Union in August the government ordered their dissolution by September 10, and on that date most of them complied under protest. A few deferred their action on the ground that it was impossible to call meetings until after the holidays, and one of them, the Union of the Seine, decided to defy the government's order. The government began proceedings against it, but at the same time announced certain reforms to secure teachers against arbitrary treatment and to improve their salaries.

FRATERNAL INSURANCE. See INSURANCE.

FRATERNITIES IN HIGH SCHOOLS. See EDUCATION.

FREDERICK VIII. King of Denmark, died May 15, 1912. He was born at Copenhagen in 1843, the eldest son of Christian IX. and of Princess Louise of Hesse-Cassel. He received his education at an ordinary grammar school. On the death of King Frederick VII. in 1863 and the accession of King Christian IX. difficulties with Austria and Prussia came to a head, and Prince Frederick, as he then was, took part in the war of 1864, which cost Denmark the duchies of Schleswig-Holstein and Lauenburg and which produced permanent ill-feeling against Germany. Upon the death of Queen Louise in 1898, however, Prince Frederick was able to take steps toward a better understanding with Germany. On the death of King Christian in January, 1906, Prince Frederick succeeded him as Frederick VIII. Shortly after his accession he made visits to England and Iceland. In the latter country he aroused great enthusiasm by appointing a mixed commission to consider the vexed question of home rule. The effort to bring this about, however, did not succeed. At the time of his accession Frederick VIII. was not particularly popular, but his great political energy, his genial eloquence and the simplicity of his life won for him before he died the hearty respect and confidence of his subjects. He was one of the most democratic of European rulers and was frequently to be seen upon the streets of Copenhagen unattended. In 1910 he suffered a severe attack of illness. This returned in 1912 and he went to Nice for the benefit of his health. Returning apparently recovered, he stopped in Hamburg. In the evening he went for a stroll about the streets and was found dead by passers-by. His body was for some time unidentified, as there were no marks of royalty upon his clothing. Frederick VIII. was related to many important royal families of Europe. He was the brother of Queen Alexandra and of the King of Greece; his wife is a sister of the German Emperor and of the Empress Marie of Russia; he was a brother-in-law of the Duke of Cumberland, son of the last King Henry, and was father of King Haakon of Norway, who married Princess Maud of Wales; he was father-in-law of Prince Charles of Sweden, a brother of the present king of that country, and he was a

son-in-law of King Charles XV. of Sweden. His death threw into mourning nearly all the principal non-Catholic reigning houses in Europe.

FREE BAPTISTS. See BAPTISTS, FREE.

FREER, PAUL CASPAR. An American chemist and public official, died April 18, 1912. He was born in Chicago in 1862 and took his degree in medicine from the Rush Medical College in 1882. He afterwards studied at the University of Munich, receiving the degree of Ph. D. in 1887. In the same year he became assistant in Owens College, Manchester, and in a few months was appointed assistant and instructor in Tufts College. Here he remained until 1889, when he was appointed professor of general chemistry at the University of Michigan. He occupied this chair until 1903. From 1901 to 1905 he was superintendent of the government laboratories at Manila, P. I. He was director of the Bureau of Science at Manila from 1905 to the time of his death, at the same time acting as dean of the Philippine Islands Medical School. He was editor of the *Philippine Journal of Science* and was the author of *A General Inorganic Descriptive Chemistry* (1895), and *The Elements of Chemistry* (1896), and over fifty pamphlets on chemical subjects published in the United States and Germany.

FRENCH EQUATORIAL AFRICA (formerly FRENCH CONGO). A French possession in equatorial Africa, on the west coast, composed of the Gabun Colony (capital, Libreville), the Middle Congo Colony (Brazzaville), and the Ubangi-Shari-Chad Colony (Fort-de-Possel). From the old area of 669,280 square miles, must be deducted, roughly, 170,270 square miles ceded under the convention of November 14, 1911, to Germany by France; and to it must be added about 6450 square miles ceded to France by Germany from the Kamerun country. The area ceded to Germany carries a population of about one million out of the original ten million (the estimated population in 1906). The products and exports are rubber, ivory, timber, palm kernels and oil, cacao, etc. Gold, copper, and iron are mined. Imports (1910), 13,190,677 francs; exports, 24,630,872 (11,119,319 and 17,453,933 in 1909). Revenue and expenditure balanced (1909) at 6,137,000 francs. A commissioner-general (M. Merlin in 1912) residing at Brazzaville is administrator-in-chief. KANEM and WADAI are French dependencies.

FRENCH ESTABLISHMENTS IN OCEANIA. A southern Pacific French colony, consisting of widely scattered groups and single islands. Area (estimated), 3065 square kilometers; population, 30,563. Capital, Papeete (3617 inhabitants), on Tahiti. Imports and exports (1910), 5,659,367 and 6,031,289 francs, respectively. Adrien Bonhoure was governor in 1912.

FRENCH GUIANA (CAYENNE). A colony (French) and penal settlement on the northern coast of South America. It covers 88,240 square kilometers (34,069 square miles) and had a population in 1911 of 49,000. Cayenne, the chief town and only seaport, had (1906) 12,426 inhabitants. Gold-mining (placer) is the chief occupation of the people. Imports and exports in 1910 were valued at 12,233,000 and 11,567,000 francs respectively. Governor (1912), F. E. Levecque.

FRENCH GUINEA. A French West

African colony. Capital, Konakry, with (1909) 6583 inhabitants; Kankan, the chief commercial centre, has 11,666; Boké, 2097; Kindia, 2083; Dubreka, 1408. The railway from Konakry to Kouroussa (588 kilometers) was completed and in operation January 1, 1911. Transport from and into the interior is by caravan, the best porters being Soussous and Malinkés. The route from Konakry to the Niger, known as the Leprince route, is via Kindia, Timbo, and Kouroussa. Rubber is the principal export, and is gathered over all the colony; but the principal sources are the Foutah-Djallon, the Faranah region, and other circles of Upper Guinea. Rice is grown, grazing is widely practiced. The mineral resources are believed to be considerable. Lieutenant-governor in 1912, C. Guy. See FRENCH WEST AFRICA.

FRENCH INDIA. Five French dependencies in India, covering 513 square kilometers, with 277,723 inhabitants in 1906 and 282,472 in 1911. Density per sq. km. (1906), 541.4. The towns are Pondichéry (the capital), Karikal, Mahé, Chandernagar, and Yanaon. The imports and exports (1910) were valued at 8,351,443 and 37,466,013 francs, respectively. Chief exports, oil seeds, raw cotton, and pulse. Railway from Pondichéry to Villapuram and Peralam to Karikal, 30 kilometers. P. I. A. Duprat was governor in 1912.

FRENCH INDO-CHINA. A dependency of France in southeastern Asia, made up of five states and a strip of territory leased from China, as follows:

	Sq. Kilometers	Pop. 1906	D.†
Annam	159,890	5,513,681	34.5
Cambodia	175,450	1,193,534	6.8
Cochin-China	56,965	2,870,514	50.4
Tongking	119,750	5,896,510	49.3
Laos	290,000	663,727	2.3
Kwangchow-Wan* ..	1,000	177,097	177.0
Total	803,055	16,315,063	20.3
*Leased territory. †Density per square kilometer.			

Total population in 1911, 16,990,220. Hanoi (in Tongking) is the capital, with (1911) 113,676 inhabitants; Cholon had 191,655, Bin-Dinh 75,000, Saigon 64,845, Pnom-Penh 54,621, Hué 50,000, Vien-tiane 20,000, Haiphong 27,000.

The railway from Saigon to Mytho (the oldest railway in the country) is being extended to Cantho (60 miles). Other lines are the Haiphong-Laoki-Yunanfu (291 miles), the line from Hanoi to the Chinese frontier (308), Tourane-Hué-Quang-tri and Tourane-Faifu (130), Saigon-Khat-Hoa-Langbian (83). The Yunnan Railway was completed in 1910.

Trade statistics are returned for the colony as a whole, and are given below in francs:

	1909	1910	1911
Imports	249,753,677	238,686,288	244,143,000
Exports	273,034,618	290,546,912	250,147,000

The general budget balanced for 1912 at 38,317,000 francs; the budget of Tongking at 8,341,017; Annam, 3,250,462; Cambodia, 4,232,416; Cochin-China, 7,321,817; Laos, 898,729; Kwangchow-Wan, 218,950; total, 59,580,391. Governor (1912), A. Sarraut.

FRENCH LITERATURE. As compared with last year, the 1912 literature impresses one as even more earnest in its pursuits. Almost

no light productions; but everywhere moral and even religious preoccupations prevail; of which Bergsonianism, which is synonymous with intuitive idealism, is only one manifestation. See an illustrative article, "Le mysticisme littéraire," by Ségur, in *La Revue*, August 15, 1912.

THEATRE. If no absolutely first-class play was produced, on the other hand there were an unusually great number of plays of average merit. We first mention such as betray cleverness without proclaiming anything else except power to amuse the theatre-goer: *En garde*, by Capus and Véber, the well-known theory of Capus, that excitement and effort drive happiness away; the lazy alone are happy. Gavault's *L'idée de Françoise* is optimistic; *L'habit vert*, by Flers and Caillavet, is a very successful satire on the French Academy. Tristan Bernard's *On naît esclave* is amusing; it shows how the masters are really the servants of their servants. Bernstein's *Assaut* is a clever melodrama in the manner of that author, and was played admirably by Guitry: jealousy against a self-made man, and finally the hero comes out vindicated. Among the plays which claim to be more philosophical are: The sensational *La Flambee*, by Kistemaekers (now played in this country under the title *The Spy*): an officer of the army is bankrupt through speculation; he is then offered solvency if he will betray army secrets to the enemy; he kills the spy on the spot and all his friends come to the rescue to free him from the consequences of the murder—it is "la flambee patriotique." Bourget and Beaunier put on the stage the *Crise*, brought about by the politicians of a republic, an arraignment of modern politics. Two better plays, though not the best of the two authors, are Hervieu's *Bagatelle* and Bataille's *Les flambeaux*: the first takes up the same theme as Musset in *On ne badine pas avec l'amour*; while in the second we see a great scholar, an admirable man, who yields one day to human passion, which has sorrowful consequences; however, he rallies at the end in a most pathetic and beautiful death. The following are more original in their conception: Brieux's *La foi*, in which a man who loses his faith then sees the awful social consequences of a population without religion, pretends to believe, then again is disgusted, and in dying tells what he conceives to be the truth—was not much liked. L. Bénére (the author of *Papillon dit lyonnais*) has another interesting idea; he shows in *Créduité* the curious effects, sometimes sad, sometimes comical, of superstitious beliefs taking hold of some members of a family; "Molièresque" has been an adjective used to praise the play. The Théâtre Antoine has had a long season with L. Népoty's *Les petits*; it shows the family spirit badly broken up by remarriage. *Esther, princesse d'Israël*, by Sebastien Leconte and A. Dumas, is an anti-Racinian play showing a fanatic and cruel Esther, cunning, and seeking the throne in order to gratify her thirst for the blood of the enemies of the Jews. A. DuBois writes also an anti-Racinian play, *Bérénice*—here again the heroine is not the sweet lover of the seventeenth century tragedy, but a shrewd diplomat who tries to induce Titus to give freedom of conscience to the Jews. An exotic play by P. Anthelm, *L'honneur japonais*, and a play dealing with the problem of colonization, *Les sauterelles*, by E. Fabre (the plague of poor magis-

trates), must also be quoted. Sarah Bernhardt appeared in a new play, *La reine Elizabeth*. The *Hélène de Sparte*, by Verhaeren, was played for the first time in Paris, and the *Belami*, from Maupassant's novel, proved no great success. An interesting reconstitution of Molière's life was made for the Maison de Molière by Donnay.

Shakespeare continues to be played carefully by the Compagnie française du théâtre de Shakespeare. During 1912 they gave *The Merry Wives of Windsor*. The Odéon gave a good *Troilus and Cressida*. Lope de Véga's *Étoile de Séville* is another sign of interest in the theatre of other nations. As to Shaw's *Mrs. Warren's Profession*, it surprised the Parisians, who wondered at such frank brutality in an English play.

Here we must mention two books: Avine, *La Renaissance du théâtre breton et l'œuvre de l'abbé Bayon*; and G. Polti, *Les Trente-six situations dramatiques*.

POETRY. Here especially (as is natural) the idealistic, at times religious, tendency is notable; not exclusively, however, our modern world allowing too much freedom to temperamental differences for any philosophical conviction to remain unrepresented. Verhaeren, after years of poetry devoted to the *forces tumultueuses* of civilization, lets a great pantheistic inspiration run through his *Blés mouvants*. Francis Jammes continues the publication of his *Géorgiques chrétiennes*, for which he was offered a prize of 3000 francs by the Academy. Religious also are the *Carmina sacra* of Louis le Cardonnell, the symbolist. Bergsonian, religious, and almost mystical is H. Franck's *La danse devant l'arche*, the ark of alliance, symbol of man's need of truth from beyond this finite universe. Franck died recently, very young. Space allows us to mention only the titles of many books, all more or less betraying the same return to conservative and classical ideals, both in thought and form: de Bouhélier, *Romance de l'homme*; Reynac, *Naissance du Verbe*; Rannette, *Clartés au crépuscule*; Lebey, *Sur une route de peupliers*; Even, *Flâneries rustiques et marines*; Thaly, *Les Chansons d'outre-mer*, and *Jardin des Tropiques* (the Antilles); Valentin, *Je dirai sur la route*; Colomb, *L'écrin*, and *Les combats*; perhaps above the others in value are Jacques Césanne's *Eternel poème* (sorrow, described in turn with sarcasm, humor, or gravity, and the only thing is to accept); and J. Gasquet's *Le paradis retrouvé* (broad and humanitarian optimism). Very little really light poetry, as A. Jaron's *Amusettes*, could be quoted. Three women deserve mention here: Cécile Périn, author of *Les pas légers* (see YEAR BOOK for 1911), broadens her horizon, and in *Variations du cœur pensif* wants "Oh! tout aimer et tout connaître"; Mme. de Rohan, in *Souffles d'Océan* sings the beauties of various countries, with preference the Orient; Mme. L. Berger sings of women, "Les vestales," "Les Druidesses," "Charlotte Corday," "Mme. de Lamballe"—and women's dresses. Two books, each of a single poem—a thing seldom seen nowadays—have won some distinction for their authors: Chantavoine's *La vie*, an "épopée familière"; and G. de Vesmes's *Le songe de la vie*, an episode of the Crusades. From among those who preach a destructive philosophy, two only are prominent: A. Londres's *Les poèmes effrénés* yields to wild enthusiasm for life in

its violent forms; he is haughty, proud, and assured of the ultimate victory of man over inanimate matter; it is futurism without the name. R. Randau is still more violent in his *Autour des feux de la brousse*, asking a return to nature, but not the nature of the civilized peasant, but of the man in the wilderness:

"Prends ta pensée au poing comme on tire un sabre
Et massacre l'idée avec la pamoison."

Two groups of poets have published collective works, claiming to represent the vanguard of modern thought: "Les loups," whose ideas have been indicated in last year's account, and who publish under the patronage of Jean Richepin, author of the preface, an *Anthologie de la jeune poésie française*; there are sixteen of them; but they are by no means so aggressive as their name would lead us to believe. The other group is that of the *Anthologie de l'Effort* (*L'Effort* is a periodical), containing poems by many of the best names, such as Duhamel, Ghéon, Spire Bazalgette (new translations from Whitman). There is a strong tendency among them to use the *vers libre*. The name of Baude-laire is heard at times, and surely inspired Ivan Gilkin in *La nuit*, and F. Benoît in *Foire aux paysages*. Banville, rather neglected of late, has been honored by an edition under the auspices of Ch. Morice. And Mistral comes before the public with *Les Olivades*, translated by himself from the Provençal original.

One of the best known of the poets of to-day died, Pierre Quillard. And Léon Dierrx, for many years the "Prince des Poètes," also died. In his place Paul Fort, the author of the *Bal-lades françaises*, was elected "Prince."

Here belongs the mention of A. Séché's *Les accents de la satire dans la poésie contemporaine*. He treats of Rostand, Tailhade, Pochon, Bruant, Jean Rictus, etc.

FICTION. The earnestness of effort and the endeavor not to waste one's talent are impressive. Let us first take the works of the masters: Anatole France's *Les dieux ont soif* is a keen study of the peculiar hypnosis produced, during the French Revolution, on generous, idealistic minds, making them irresponsible, bloodthirsty monsters. P. Loti's *Pélerin d'Angkor* is not only a fascinating picture of Indo-China but interesting as a sort of return of Loti to the spiritualistic beliefs of Christianity. Romain Rolland has brought to an end, in the tenth volume, the story of *Jean-Christophe*; *La nouvelle journée* shows the hero, after having overcome his grief for the death of Olivier, born to life again by a new love, and then dying, not yet recognized by the world as a great artist, but having fulfilled his mission.

There are not as many social novels as usual: Acker, in *Deux cahiers*, compares the women of the past with those of the new generation. Boylesve's *Madeleine, jeune femme*, is a sequel to last year's book; the young woman brought up according to old-fashioned principles is now saved from temptations by the ideas imposed on her (hence one does not know whether Boylesve believes in old-fashioned education; this book seems to contradict the former one). Boulenger's *Marché aux fleurs* combats an idea really abandoned to-day, the idea of not consulting the girl's heart in marriage. Marcel Prévost continues his "series" with *Lettres à Françoise*

maman, discussing modern education (very suggestive), and Pierre Mille's *Caillou et Titi* is a study of children's minds. Bauduin has an unpleasant picture of the peasants marching to ruin through alcoholism in *Les campagnes en marche*. Henry Bordeaux, in *La neige sur les pas*, discusses the "pardon" for a sinner in matrimonial affairs, in his usual orthodox fashion. *Les Fabreçé*, by Paul Margueritte, is one of the strongest books of the year; it is a sort of "Rougon-Macquardt series" in one volume: the family spirit passing from generation to generation and producing sometimes evils, but much more frequently blessings. *Les rafales*, by J.-H. Rosny, *ainé*, is the first of a series of pictures of bourgeois life: a second-rate business man attempts new methods, is ruined, and lacks the energy to start again; then his wife, one of those admirable French women, courageous and energetic when circumstances require it, steps in and saves the situation. *A l'affût*, by G. Rageot, is a powerful, rapid drama: it tells the vengeance of a forester against his employer who has brought shame on him. Here we may place a number of psychological novels that deserve mention: The most successful of the year, because the French Academy awarded it a 10,000-franc prize, is André Lafon's *L'élève Gilles*, the story of a boy, sensitive, not stupid, having no sensational adventures, told in a terse manner, and in the style of *Marie Claire*. H. Régnier's *L'Amphisbène* is in the ordinary style of the author: the heroine writes to her former husband, now a good friend of hers, the whole story of her new love. A. Bailly in *Les chaînes du passé* comes back to the self-analyzing hero of the *Disciple*, by Bourget. A. Beaunier's *L'homme qui a perdu son moi* describes the scholar who loses his own self because taken up so entirely by the object of his studies. G. Rageot's *La renommée* shows the disastrous results that fame can have in a family, on husband, wife, and child (very unreal, however). Binet-Valmer's novels have always some flavor of their own; this time the author of *Lucien* studies in *Le plaisir* the everlasting enmity between man and woman waged in love. Three authors have criticisms of what may be called the "smart set" of Paris: P. Valdagne, *Les leçons de Lisbeth Lottin*; J. L. Vauroyer, *La maîtresse de l'amie*, and H. Duvernois, *Le veau gras*. Character sketches are attempted very brilliantly: the young woman during the honeymoon by the exquisite master, A. Lichtenberger, in *La petite madame*; the tramp, by M. Audibert, in *Pilleraud*; the second-rate actor (combination of Daudet and Zola style), by A. Arnoux, in *Didier Flaboche*; the victim of hazing, by M. Yell, in *Cauët*. There are political novels: Delzens, *Le maître des foules*; O. Aubrey (pseudonym of a former president of the cabinet), *Sœur Anne*; and especially the beautiful *Frontières du cœur*, by Victor Margueritte, the author of *Une époque*: a French girl marries a German physician, they are perfectly happy, but a war breaks out, and both come to feel that something now is between them that prevents them from ever being one again; Herr Professor Knatschke, by Hansi (J. J. Waltz), is a bitter satire of an Alsatian against the conquerors. The problem of colonization has, as last year, inspired some of the best novels; first of all, *La fête Arabe*, by the brothers Tharaud; Colonel Baratier, *Épopées Africaines*; Jean d'Estray, *Then-si, la petite*

amie exotique; R. Randau, *Le commandant et la Foulbé*; Ch. Géniaux, *Le choc des races* (in Tunis). Among exotic novels, J. Clary, *L'île du soleil couchant* (Japan). Novels that betray the revival of religious preoccupations are: L. Barry, *Au delà du bonheur*; L. Cathlin, *Le prêtre*; and R. Claude, *L'extase*. Two scientific novels of interest are J. H. Rosny, *ainé*, *La mort de la terre*, which describes humanity having reached the extremes of civilization and dying from thirst, the globe being absolutely dried out; and M. Renard, *Le Pêril bleu*, an amusing fancy of the Wells order. One of the most interesting attempts at renewing the novel is that by Pierre Hamp, *Le rail*, in which men are considered absolutely independently from what we call human qualities, and are studied merely as organs of a great modern railroad company. J. Lorédan's *Un grand procès de sorcellerie au XVII. siècle* is a most fascinating historical novel. Some amusing books are: T. Bernard, *Mathilde et ses mitaines*; Fisher, *L'inconduite de Lucie*; Foley, *Perrette en escapade*; P. A. Schayé, *Journal de Cloud Barbaut*.

WOMEN'S NOVELS. This year we look in vain for the anti-man novel, except in Louise Compain's *La vie tragique de Geneviève*, a sort of *Uncle Tom's Cabin*, where the woman has taken the place of the negro. All the others seem to have grown tired, for a while at least, of wandering in lands of fancy for women; in Mme. Camille Marbo's well-received book, *Celle qui défait l'amour*, the heroine who defies love is punished. The same attitude is found in Jehan Yvray and others. What is Mme. Jacques Morel's (Mme. Pottier) *Feuilles mortes*, which was awarded the 5000 francs prize of "La vie heureuse," except the old theme of *La Nouvelle Héloïse*? Even Mme. Daniel Lesueur, the author of the fierce *Nietzschéenne*, gives up the "fight," and in *Le tournant des jours* studies a type of the artistic woman. The other famous women writers publish novels where the woman question plays no part: Marcel Tinayre, *Madeleine au miroir*; Delarue-Madrus, *L'inexpérimentée*; Miriam Harry, *La divine chanson*, inspired by the poetry of the Oriental countries. Finally, a delightful book, rather for children, Mme. Georges Renard, *Les bêtes qui ne le sont pas*, depicting life on a farm.

SHORT STORY. Once more the "Prix Goncourt" was awarded this year to a volume of short stories; it went to A. Savignon, who lives in England, on the southern coast, whence he sends articles to English magazines and papers; his volume, *Les filles d'Ouessant*, describes the very primitive customs of the islands. Marguerite Audoux in *Valsérine* offers sketches of boys and girls in the same manner as in *Marie Claire*. Bourget has seven stories in his *Envers du Décor*, not different from what he writes generally. R. Dervieu, in *Petites filles d'une grande nuit*, delights in discovering the rascality of people generally considered saintly. *Le village dans la Pinède*, by G. Mourey, tells stories of humble people in Provence. Léon Lafage has found the accents of a Daudet for his stories of Quercy contained in *Le bel écu de Jean Clochepin*.

We must also mention a lively discussion regarding the short story, started in the fall by the men of the younger generation; they think that this "genre" has become vulgar by the influence of the "feuilleton" and propose to restore it and to elect a "Prince de la nou-

velle" as they elect a "Prince des poètes." They accuse even such men as Schwob, Rosny, Maupassant, Daudet, and Marguerite of having yielded to the temptation to write for the masses.

HISTORY OF LITERATURE AND CRITICISM. Scholars are working more diligently than ever, but on special periods or subjects. Only three general works need be mentioned, and none of them of the highest value. Strowski has a *Tableau de la Littérature en France au XIX. siècle* (short); Léo Clarétie gives the last (5) volume of his popular *History of French Literature*; while Abry, Audic, and Crouzet give a *Histoire illustrée de la Littérature Française*, interesting because they take as a criterion of importance the success of a book with the public. (In France, too, the country of intelligent criticism!) Striking is the lack of important work in the field of the Middle Ages. After Luchaire's posthumous *La société Française au temps de Philippe Auguste* (which is not strictly literature) we must come down to the Renaissance, where keen interest is shown, especially in the line of editing important texts. The first volume of Lefranc's *Rabelais* came out; an excellent edition of Calvin's *Institution chrétienne* (1541) by the same; he also completed Léopold Monod's *Le caractère de Calvin d'après ses lettres*. Further, the *Vie d'un héros, Agrippa d'Aubigné*, by S. Rocheblave, must be mentioned. In the seventeenth century we have to record the discovery of *Racine MSS.*, in Russia by the Abbé Bonnet (some still doubt their authenticity); a valuable edition of *La Princesse de Clèves*, with introduction by Dorchain; and the well-informed books by Magne on *Voiture et l'Hôtel de Rambouillet*, which show that tradition had idealized perhaps too much the "refined" society: the Marquise, however, comes out very well from this searching study. In the eighteenth century Rousseau (whose bi-centenary has been celebrated all over the world, and not without violent protest, especially from political opponents of the present government) easily leads the list of men who have inspired students in literature; we can only name from all that literature: Faguet's two volumes (*Rousseau contre Molière* and *Rousseau penseur*), Fabre, Bouvier, Tiersot (*Rousseau as a Musician*), Plan (*Rousseau raconté par les gazettes de son temps*), etc. The *Revue de Métaphysique et de Morale* devoted a whole number to the glorification of Rousseau, while the *Revue critique des idées et des livres* devoted one entire issue "contre la glorification de Rousseau." F. Gaussy continues his studies on Voltaire by *Voltaire seigneur de village* (in Ferney). Delafaye has a *Vie et œuvre de Palissot*; Harman (pseudonym) a *Histoire de Mme. de Genlis*, which is remarkably well informed. A new edition of *Mirabeau*, by Lumet, "*Les écrits*," is about all that concerns the time of the Revolution. For romanticism, Pellissier's *Le réalisme du romantisme* is the only general work. But we have also: Beaunier, *Chateaubriand*; Comte d'Antioche, *Chateaubriand, ambassadeur à Londres*; Léo Séché, *Les amitiés de Lamartine*; *Journal d'Italie*, by Stendhal, published by Arbalet; *Stendhal et les commentateurs*, by Méliat; *Vigny*, by Baldensperger; *Théophile Gautier*, by Larguier; *H. de Balzac*, by Lumet; the third volume of W. Karénine considerable work on George Sand; *Sainte Beuve, étude médi-*

copsychologique, by Dr. Voizard; and *Cénacle de Joseph Delorme*, by L. Séché; *Les pamphlets contre V. Hugo*, by Bersaucourt; *Sur Barbey d'Aurevilly*, by Laurentie; *Une étape de la conversion d'Huymans*, by Du Fresnois; *Le Baile (maître) Alphonse Daudet*, by Baptiste Bouet; memoirs on Daudet by a Provençal friend.

Let us mention also here the *Mémoires de Jean Richepin*; Bourget, *Pages de critique et de doctrine*; Bertaud, *Les romanciers du nouveau siècle*. Niceforo, *Le génie de l'argot*. A. Dautzat, *Défense de la langue française*.

Among various events to be recorded: The celebration of the bi-centenary of Rousseau, already alluded to; the centenary of Eugénie and Maurice de Guérin; the fiftieth anniversary of *Salammbô*; the inauguration of the statue of Verlaine in the Luxembourg. The "Nobel prize" for literature went to Maeterlinck; the "Association syndicale des critiques" conferred a gold medal on Berret's *Moyen-Age dans la Légende des Siècles* (see YEAR BOOK, 1911). Elections in the French Academy: The philosopher Boutroux and General Liautey. The deaths which have not been recorded elsewhere: Gabriel Monod and the éditeur Lemerre. Finally, let us mention the donation to the French Academy of the Château de Nohant, made famous by George Sand; and of the so-called "Désert" in Ermenonville, made famous by the stay of Rousseau in that locality at the end of his life.

FRENCH SOMALI COAST. A French protectorate on the Gulf of Aden. Official report gives area 120,000 square kilometers and population 208,061. Jibuti, the capital, has about 11,000 inhabitants. Imports (1910), 21,024,712 francs; exports, 33,566,887. There are 81 miles of railway in the country (the railway from Jibuti into Abyssinia, which has a total length of 193 miles). The local budget balanced (1909) at 1,373,000 francs. M. Pascal was governor in 1912.

FRENCH WEST AFRICA. A French African possession composed of the following colonies and territories (area, population, and density), according to *Gotha* and purporting to be for 1910:

	Sq. kms.	Pop.	D.
Senegal	191,600	1,172,096	6
French Guinea	239,000	1,822,090	8
Ivory Coast	325,200	1,132,812	3.5
Dahomey	107,000	825,460	8
Upper Senegal and Niger	782,700	4,472,991	6
Mauritania (ter.).....	893,700	600,000	0.7
Military Territory of the Niger	1,383,700	1,074,121	0.8
Total	3,922,900	11,100,000	2.8

The *Annuaire du Gouvernement Général de l'Afrique Occidentale Française* (pub. 1911) gives the following areas: Senegal, 192,000 sq. kilometers; Fr. Guinea, 231,702; Ivory Coast, 315,000; Dahomey, 107,000; Upper Senegal and Niger, 2,000,000, with the Saharian zone of influence, 819,000 for the administered districts; Military Territory, 1,300,000; Mauritania, 350,000. Total European population in 1911, 7358; aborigines, 11,336,000.

The products and exports are peanuts, rubber, palm kernels, palm oil, gum arabic, live animals, etc. Imports and exports of the col-

onies in 1910 and the increase over the 1909 trade are seen below (values in francs):

	Imports		Exports	
	1910	Increase	1910	Increase
Senegal	82,607,568	14,695,329	64,254,179	5,089,262
U. S. & N.	7,036,901	4,694,709	3,996,934	5,836,438
Fr. G. ...	29,562,772	6,642,249	18,306,405	1,062,296
L. Coast.	16,049,464	4,857,212	15,749,700	3,961,848
D'y	17,838,753	3,622,757	17,886,254	1,535,640
Total...	153,095,448	34,512,256	125,193,472	15,361,452

For railways see the articles on the separate colonies and territories. The total budget balanced (1909) at 87,865,000 francs and the debt stood (Jan. 1, 1910) at 156,277,000. Dakar, in Senegal, is the capital. See the articles under separate titles. Governor-general (1912), W. Merland-Ponty.

FRIENDS, RELIGIOUS SOCIETY OF. The "Hicksite" branch has been more than ordinarily active during the past year. Its biennial general conference was held at Chautauqua August 27-September 3. In conjunction with the other branch of Friends the Whittier fellowship movement has taken form and a guest-house opened at Hampton Falls, N. H., in the Whittier neighborhood. The general conference advancement committee and the advancement committee of Baltimore Yearly Meeting have been doing unusually good work. The Philadelphia Yearly Meeting has established a central bureau with a secretary in charge, the particular labor being to look after the philanthropic and First-day school interests of the society. The society has during the year practically enlarged its endowment fund for two colored schools in the South in which it is interested, to the extent of about \$60,000, and has been spending an unusual amount in the various lines of its activities. In 1913 it will hold its biennial summer school at George School, about twenty-five miles from Philadelphia. This will make the fourth in the series. The school lasts two weeks and takes up a comprehensive study of sociological and religious topics by practical class work and lectures by experts. Considerable labor has been employed in strengthening the weak spots in the society; and a few meetings which had been discontinued have been revived. The society has also been branching out in places where it has never had meetings, by organizing associations and holding meetings for the delivery of the Friendly message and the promulgation of the Quaker faith.

FUNGICIDES. See **BOTANY.**

FUNK, ISAAC KAUFMANN. An American author and publisher, died April 4, 1912. He was born in Clifton, O., in 1839, and graduated at Wittenberg College in 1860. He studied theology at the Wittenberg Theological Seminary in 1861. In the same year he entered the ministry of the Lutheran Church. Until 1872 he occupied pastorates in Carey, O., and Brooklyn, N. Y., but after a trip through Europe, Egypt, and Palestine he entered journalism and the publishing business. In 1872-3 he was associate editor of *The Christian Radical*, and from 1873 to 1875 of *The Union Advocate*. He founded in 1876 *The Metropolitan Pulpit*, and in the following year *The Complete Preacher*, which was merged in 1878 with *The Homiletic Monthly*. The name of this

was changed in 1885 to *The Homiletic Review*, under which it is still known. In 1887 Dr. Funk entered into partnership with Adam Willis Wagnalls, founding the publishing house known for many years as Funk and Wagnalls, and which was later incorporated as The Funk and Wagnalls Company. He took an aggressive interest in prohibition and in 1880 established *The Voice* as a campaign paper. This was conducted for many years. In 1880 he founded *The Literary Digest*. His firm gave especial attention to the publication of important books of reference. Among these were *The Pulpit Commentary*, *The Jewish Encyclopedia*, *The Schaff-Herzog Encyclopedia of Religious Knowledge*, *A Standard Bible Dictionary*, and *The Encyclopedia of Social Reform*. The most important of these publications is probably *A Standard Dictionary of the English Language*, of which the first edition was issued in November, 1894, and a revised and enlarged edition in 1903. Dr. Funk took an active part in the preparation of this dictionary, as lexicography was his favorite pursuit. In his later years he became much interested in the investigation of psychic and spiritualistic phenomena, but was never a believer in spiritualism in the accepted meaning of the term. His published works include *The Next Step in Evolution* (1902); *The Widow's Mite, and Other Psycho Phenomena* (1904), and *The Psychic Riddle* (1907).

FURNESS, CHRISTOPHER, FIRST BARON OF GRANTLEY. An English ship owner and builder, died November 10, 1912. He was born in West Hartlepool, England, in 1852, and was educated privately. He succeeded his father, John Furness, as head of the steamship line of Furness, Withy & Company. He was, in addition, interested in many other important enterprises. In 1907 he effected the consolidation of the British Maritime Trust and the Chesapeake and Ohio Steamship Company. He was the chief promoter of the Cargo Fleet Iron Company. From 1891 to 1895 and again from 1900 to 1910 he was Liberal member of Parliament from Hartlepool. He was reelected in 1910, but was unseated on petition. In 1908 he created much discussion among labor men and employees by the terms of an ultimatum which he delivered to the employees of the shipping concern of which he was the head. The men were on strike for larger wages and they were told by Furness that if they thought they could carry on the works the firm was willing to sell out to them at a price to be fixed by assessors; or, if they preferred, the firm was willing to admit its workmen to partnership on a profit-sharing basis. The trade union accepted the proposal for a year as an experiment. The plan was considered a success by the company, which paid the men 9 per cent. The men, however, were dissatisfied and did not continue the arrangement. Sir Christopher Furness was knighted in 1895, and was created first Baron of Grantley in 1910.

FURNESS, HORACE HOWARD. An American Shakespearean scholar, died August 13, 1912. He was born in Philadelphia in 1833 and graduated from Harvard College in 1854. The two years following his graduation were spent in Europe. Returning to Philadelphia, he studied law and in 1859 was admitted to the bar. His contributions to legal subjects were important, but the chief work of his life was the study of Shakespeare's works and the

preparation of his *Variorum Shakespeare*. This he began early in his life and continued until the time of his death. The first volume, *Romeo and Juliet*, was issued in 1871, and this was followed by *Macbeth* (1873); *Hamlet* (1877); *King Lear* (1880); *Othello* (1886); *Merchant of Venice* (1888); *As You Like It* (1890); *The Tempest* (1892); *Midsummer Night's Dream* (1895); *Winter's Tale* (1898); *Much Ado About Nothing* (1899); *Twelfth Night* (1901); *Love's Labor Lost* (1904); *Antony and Cleopatra* (1907).

Dr. Furness's interest in Shakespeare began when he heard Fanny Kemble interpret some of the characters in his youth. He then began to make a study of Shakespeare and his writings, and came to be known as the greatest Shakespearean authority in the United States and one of the greatest in the world. He also began a collection of Shakespearean relics, which he continued until his death. This is the most notable Shakespearean collection in the United States. It contains not only relics of Shakespeare himself, but of the many actors and actresses who have become eminent in Shakespearean rôles. Associated with him in his editorial work were his wife, herself the author of a concordance of Shakespeare's *Poems*, and his son, Horace Howard Furness, Jr. The *Variorum Shakespeare* has been received as a monument of scholarship. Dr. Furness received honorary degrees from Yale, Columbia, and Cambridge Universities. He was a member of many foreign and American learned societies. In addition to his writings on Shakespeare he wrote several articles on homeopathy and spiritualism. In the years immediately preceding his death he and his son made a study of monkeys, with important and interesting results.

FUTRELLÉ, JACQUES. An American author, died at sea April 15, 1912. He was born in Pike county, Ga., in 1875, and was educated in public and private schools. From 1890 to 1892 he was engaged in newspaper work. For two years following he acted as theatrical manager and from 1904 to 1906 was a member of the editorial staff of the *Boston American*. He was the author of *The Chase of the Golden Plate* (1906); *The Thinking Machine* (1907); *The Simple Case of Susan* (1908); *Elusive Isabel* (1909), and *The Diamond Master* (1909). Mr. Futrelle was one of the victims of the *Titanic* disaster.

GAIRDNER, JAMES. An English historian, died November 4, 1912. He was born in Glasgow, Scotland, in 1828, and was educated at Edinburgh University. In 1846 he became clerk in the Public Record office of Edinburgh and two years later was appointed assistant keeper of the records. Even before this time he had begun his association with the great work of his life, a monumental edition of the *Letters and Papers of the Reign of Henry VIII.*, and continued editing this work until the time of his death. He edited for the master of the rolls, *Memorials of Henry VII.*, and *Letters and Papers of the Reigns of Richard III. and Henry VII.* In 1879 he was appointed editor of *The Letters and Papers of the Reign of Henry VIII.*, and under his editorship Volumes 5 to 21 were completed. He also edited the *Paston Letters*, 1872 to 1875. He was editor of several volumes for the Camden Society and was the author of a volume on *England in the series Early Chroniclers of*

Europe. He wrote a *Life of Richard III.* (1878); *The English Church in the Sixteenth Century to the Death of Mary* (1902); *Lollardy and the Reformation in England* (1908). He also contributed many articles to the *Dictionary of National Biography* and the *English Historical Review*.

GALE'S COMET. See ASTRONOMY.

GALSWORTHY, JOHN. See LITERATURE, ENGLISH AND AMERICAN.

GALVESTON CAUSEWAY. See BRIDGES.

GAMBIA. A British crown colony (69 sq. miles, population about 9000) and protectorate (3550 sq. miles, about 152,000 inhabitants) on the west African river Gambia. The inhabitants are mostly pagan and Mohammedan negroes of the Jollof, Mandingo, Sarahouli, Fullah, Jolah, and other tribes. The capital of the colony is Bathurst, on St. Mary's Island. The cultivation of peanuts is the principal industry. Imports (1910), £578,983. Imports of cotton goods in 1910, £130,611; kola nuts, £85,534; rice, £46,087; sugar, £9708; spirits, £7129; specie, £208,544, etc. About 49 per cent. of imports come from England. Exports (1910), £535,447. Exports of peanuts (mostly to France) in 1910, £387,943; hides, £11,310; palm kernels, £5640; specie, £112,194; etc. Revenue (1910), £82,880; expenditure, £63,301. Lieut. Col. Sir H. L. Galway was governor in 1912.

GAMMA. See NAVAL PROGRESS, AVIATION.

GARBAGE AND REFUSE DISPOSAL. With the exception of the United States, the universal practice among cities which have abandoned primitive methods of garbage disposal is to mix the garbage with ashes and other more or less combustible refuse and burn the mixture in refuse destructors. These are operated under forced draft at a high temperature and in many instances, especially where soft coal is used as domestic fuel, the heat of combustion is utilized to raise steam for electric and other power. This type of destructor, which originated in Great Britain and is extensively used in that country, has been coming into use in the United States during the past five years, in place of the older type of crude furnaces which burn garbage only and require large quantities of extra fuel for the purpose.

During 1912 San Francisco began the construction of a large destructor, and Seattle continued carrying out its plan to build five 60-ton-per-day plants, located in different parts of the city. The first of the Seattle destructors was put in operation in February, 1908; the second in August, 1911, and the third was put under construction early in 1912. (See *Engineering News*, July 4, 1912, for illustrated description.) A number of cities in the Canadian Northwest were also building destructors in 1912. As a rule, the destructors built in the United States have not utilized the heat of combustion other than about the plant itself. This has been largely due to the opposition and influence of electric light and power companies, but probably it has also been due in no small part to the fact that there is as yet little experience to prove that it would pay to install and operate electric generating plants under conditions prevailing in American cities. During 1912 the city of Minneapolis began supplying current to light a considerable number of arc street lamps from power derived from a garbage incinerator of the American type. At

Calgary, Alberta, two refuse destructors were being built in 1912. It was proposed to use the heat from one destructor in a municipal asphalt paving plant and from the other to warm a sewage treatment plant during the severe winter weather of that section.

In nearly all the larger cities of the United States garbage is treated by the reduction process for the sake of the resulting grease and fertilizer base. With the exception of Cleveland and Columbus, O., these reductions plants are owned and operated by private companies. The companies generally receive a bonus from the cities, but the two municipal plants just named report a profit.

Piggeries, or hog ranches, as they are called in the West, appear to be becoming more numerous of late. A few years ago they were generally regarded as a makeshift, certain to be a nuisance and likely to breed tuberculosis, trichinæ, and hog cholera. Little is now heard about danger from trichinæ, and in general it now appears that if reasonable sanitary precautions are taken a municipal garbage piggery or hog ranch is no more offensive to human beings and no more dangerous to the animals themselves than any other equally large collection of hogs. A wise precaution, which seems to be taken but seldom, is to cook the garbage thoroughly before it is fed to hogs, thus insuring the destruction of any possible infectious bacteria in the garbage, just as the skimmed milk of many creameries is now pasteurized before it is fed to hogs or to calves. Feeding city garbage to hogs is practiced in a number of places in New England, in some places in the Middle West, and in California.

The garbage of Los Angeles is collected by the city and hauled to a well-designed shipping station. There it is dumped into railway cars supplied by a contractor, hauled twenty miles over an electric railway line into the country, and fed to some twenty thousand hogs, under a subcontract system. Hog-breeding is practiced on an extensive scale. The pigs are immunized against hog cholera while quite young and the losses from that disease are said to have fallen to a very low figure since immunization was begun. In 1912 the Los Angeles County Board of Health ordered the feeding of Los Angeles garbage to hogs stopped, but the city attorney has questioned the authority of the board in the premises. The garbage of the adjoining city of Pasadena was also being fed to hogs in 1912, the hog ranch being located on or near the city sewage farm, near a rapidly growing residence section. It was reported that Pasadena had contracted for an American type of garbage furnace.

Early in 1912 there was made public a lengthy report on "City Waste Studies in Ohio." The studies were made in 1909-10 by engineers of the Ohio State Board of Health, but the report was not completed until 1911. See *Modern Destructor Practice*, by W. Francis Goodrich (London and Philadelphia, 1912), for an exposition of the British type of refuse destructor and an account of its use throughout the world. The book also gives some information regarding other types of garbage burners and contains a few paragraphs on American garbage-reduction works. A symposium on garbage and refuse disposal was presented by a dozen or so engineers and health officers at the annual meeting of the Ameri-

can Public Health Association at Washington, D. C., in September, 1912, and will presumably be printed in the *Journal* of the association during 1913.

GARDEN CITY MOVEMENT. See CITY PLANNING, *Great Britain*.

GARDNER, JAMES TERRY. An American engineer and capitalist, died September 10, 1912. He was born in Troy, N. Y., in 1842, and was educated as an engineer at the Rensselaer Polytechnic Institute and the Sheffield Scientific School. He was employed during the Civil War by the United States government as inspector of the harbor defenses of San Francisco, and he later served on the United States Geological Survey. From 1876 to 1883 he was director of the New York State Geological Survey and during the same period served on the State board of health. In the latter part of his life he entered business and became vice-president of several large coal companies.

GAS ENGINES. See INTERNAL COMBUSTION MOTORS.

GAS, ILLUMINATING. See CHEMISTRY, INDUSTRIAL.

GAS, NATURAL. The output of natural gas in 1911 was slightly less than that of 1910, the respective figures being 508,353,244,000 cubic feet and 509,155,309,000 cubic feet. The value of the product in 1911, however, was greater than that of 1910 by nearly \$4,000,000. The value of the 1911 product was, in round numbers, \$74,000,000. The increase in demand for natural gas by consumers of all kinds, according to the officials of the United States Geological Survey, makes the supply of gas a matter of great seriousness. In Ohio and Indiana the yield has diminished so rapidly as to stop the investment of further capital necessary for increased production. An important feature bearing on the production of gas was the excessive demand for it in Kansas City, Mo., and a commission was appointed to investigate the probable duration of the supply of that city, which reported that a supply of natural gas sufficient for the needs of the city was not possible for longer than three or four years.

Pennsylvania was the greatest consumer of natural gas in 1911, with an output of 154,475,376,000 cubic feet; Ohio was second, with 112,123,020,000 cubic feet; West Virginia third, with 80,868,645,000 cubic feet, and Kansas fourth, with 77,861,243,000 cubic feet. On December 31, 1911, there were 10,809 productive wells in Pennsylvania, 4755 in West Virginia, 4717 in Ohio, 2633 in Indiana, and 2004 in Kansas. The total number of productive wells in the United States on that date was 28,428.

During the last few years the separation of the more volatile grades of gasoline from natural gas issuing from oil wells has become a profitable industry. There was in 1911 an output of 7,425,839 gallons of gasoline from this source, with an estimated value of \$531,704.

GAS TURBINES. See INTERNAL COMBUSTION MOTORS.

GATES, GEORGE AUGUSTUS. An American educator, died November 20, 1912. He was born in Topsham, Vt., in 1851, and graduated from Dartmouth College in 1873. After studying from 1878 to 1880 in Germany he entered the Andover Theological Seminary. He was ordained to the Congregational ministry and from 1880 to 1887 was pastor at Upper Montclair, N. J. In the latter year he was elected

president of Iowa College and remained in this position until 1901, when he became pastor of the First Church at Cheyenne, Wyo. From 1902 to 1909 he was president of Pomona College. He was elected president of Fisk University for colored students at Nashville, Tenn., in 1909. He was considered one of the foremost leaders in the higher education of the negro race. He resigned the presidency of Fisk University on account of ill health in 1912. He wrote an exposure of school-book trust methods, entitled *A Foe to American Schools*, in 1897.

GEMS, ARTIFICIAL. See **CHEMISTRY, INDUSTRIAL.**

GEMS AND PRECIOUS STONES. The precious stones mined in the United States in 1911 were valued at \$343,692, compared with a value in 1910 of \$295,380. The diamonds mined were valued at \$2700; emeralds, \$9500; sapphires, \$215,313; turquoises, \$44,751. The important feature of the gem-mining industry of the United States, according to the United States Geological Survey, was the result of the prospecting in 1911 at the Turner emerald mine near Shelby, N. C. The quality of some of the gems and the value of the gem material found in this deposit with a small amount of development work are promising, for the output included gems valued at \$100 to \$200 per carat and was equal in quality to the average run of emeralds from South America. The largest emerald so far discovered in North Carolina measured about $1 \times \frac{3}{4} \times \frac{1}{2}$ inch. Most of the American diamonds came from Arkansas and California. The most important find of the year in Arkansas was an $8\frac{1}{2}$ -carat white diamond, the largest diamond so far found in the State. Another white diamond of 3.44-64 carats was also found. Much interest was aroused in the moss agates found in Montana, some of which are remarkable for their resemblance to landscapes. The cut gems consist of stones suitable for use in brooches, stickpins, watch fobs, and other ornaments. The gems cut from this stone command good prices, bringing anywhere from \$1 to \$200 or \$300 each.

GEOGRAPHICAL SOCIETY, AMERICAN. To celebrate the sixtieth anniversary of its foundation and the completion of its new home at Broadway and 156th Street, New York City, the society organized a transcontinental excursion and invited as its foreign guests forty-three eminent European geographers delegated by the leading foreign geographical societies and universities. The excursion left New York on August 22, under the direction of Prof. W. M. Davis, and returned to that city on October 17, having spent eight weeks in visiting the Yellowstone National Park, Crater Lake, the leading Pacific Coast cities, the Grand Cañon of the Colorado, the North Carolina Appalachians, and other regions affording many geographical types for their observation. Over sixty American geographers were with the excursion in different sections of the journey, and thus the foreign guests saw a considerable part of the United States under scientific guidance. The society will publish a memorial volume, which will include papers by the foreign members of the excursion. The society has rearranged its book collections to make them best available for study. It gave a two months' exhibition of 700 photographs illustrating the scenery and various activities of many of the

Western and Southern States. Its annual *Bulletin* contains over 1100 pages, including an analytical index which is a guide to the best geographical periodicals and maps of the year. Its lecture course was largely attended. It coöperated in fitting out the Crocker Land Expedition to the American Arctic, which is to sail north in the summer of 1913.

GEOGRAPHIC SOCIETY, NATIONAL. A society founded in 1888 with the object of collecting and diffusing geographic knowledge chiefly through its official organ, *The National Geographic Magazine*. It maintains research work both independently and in connection with other organizations and institutions. During 1912, in coöperation with Yale University, the society maintained a large expedition in Peru under the direction of Dr. Hiram Bingham. In the early part of the summer Mr. George C. Martin, geologist of the United States Geological Survey, was sent by the society to Alaska to make an investigation of the eruption of Mt. Katmai and neighboring volcanoes. This work is preliminary to an extended study of the belt of volcanoes in Alaska which will be systematically undertaken in 1913. The society also assisted W. E. Clyde Todd of the Carnegie Museum of Pittsburgh in making a biological survey of the region east of Hudson Bay. The membership of the society is about 150,000. The officers in 1912 were as follows: President, Henry Gannett; vice-president, O. H. Tittmann; secretary, O. P. Austin; treasurer, John Joy Edson; director and editor, Gilbert H. Grosvenor; assistant editor, John Oliver La Gorce.

GEOLOGY. The contributions to geology in the year 1912 may be said to include much of real interest and value, if nothing of extraordinary character. Progress conformed to the normal course that it has followed in the last few years. An important factor for the promotion of the science has been, of course, the work carried on by governmental surveys, State and national, with their staffs of experts, who cover practically all fields of research after a more or less systematic plan. The material that is thus annually assembled for publication is of enormous volume and of the widest scope. Among the works of very general appeal which appeared during the year under such auspices may be mentioned the geological map of North America, issued by the United States Geological Survey under coöperation with the surveys of Canada and Mexico. The map includes the latest developments in exploration and stratigraphic classification, and is prepared on a scale of one inch to about 80 miles. It is accompanied by a very comprehensive index that has been compiled by Bailey Willis. This volume is really a summary of the results accomplished in mapping the various sections of the continent, with views as to the correlation of these results. The work will no doubt find wide appreciation as a standard of reference in this field.

PRE-CAMBRIAN LIFE. That the abundant and varied life forms present in the lowermost Paleozoic strata comprising the Cambrian system do not represent the first beginnings of life on the globe has long been known to geologists, although the records supplied by the earlier formations have been of the scantiest kind. A very general explanation for the scarcity of fossils in the oldest strata is found in the various vicissitudes to which they have been sub-

RECONSTRUCTION OF EOANTHROPUS DAWSONI ("SUSSEX MAN")

DRAWN UNDER THE DIRECTION OF DR. W. P. PYCRAFT OF THE BRITISH MUSEUM
FOR THE ILLUSTRATED LONDON NEWS

१२०१

jected incidental to their great age. The Pre-Cambrian sediments in most sections have undergone profound changes from heat and pressure that have obscured, if not obliterated, any evidences of organic life they may have contained. Nevertheless, discoveries of fossils in these strata have been reported from time to time. One of the more recent finds was made by A. C. Lawson in the vicinity of Stelprock Lake, west of Port Arthur, Ontario, Canada. The fossils occurred in limestones that are placed by that authority in the Lower Huronian division, just above the Keewatin of the Archean, from which the limestones are separated by an erosion interval. If this determination of position should prove correct, the discovery is perhaps the most important of its kind yet made, as it spans a tremendous gap in the records of life history on the globe. A description of the fossils has been given by Walcott, who finds that they are related to the sponges, or rather combine characters possessed by both the sponge and coral families. They are quite unlike the fauna found by him in the Pre-Cambrian of Montana and are placed in the new genus *Antikokania*. They consist of globose, cylindrical or pear-shaped forms, built up of radiating tubes, of hexagonal outline in some specimens. Though of primitive character, they still must be considerably removed from the first stages in the development of life on the earth.

EARLY MAN. The discovery of some primitive human remains in southern England aroused both geological and anthropological interest as one of the well-authenticated instances in which man has been revealed in the surroundings of a past geological period. The discovery was made in a gravel pit in Sussex and consisted of the upper part of a skull and one-half of a lower jaw, together with numerous animal remains, including those of the Pliocene elephant, mastodon, hippopotamus, beaver, and horse. Very primitive flints (eoliths) were also found in the vicinity. The fossil associates would seem to indicate the late Tertiary period, preceding the Glacial epoch, an earlier date than that assigned to any similar discovery hitherto made in Europe. It should be mentioned, however, that the flints resembled those usually referred to the Middle Pleistocene, or Chellean stage, of human culture. Professor Keith and Dr. A. S. Woodward, who examined the skull, agreed that it represented a type of man more primitive than the Neanderthal and Heidelberg types. Compared with the Heidelberg type, which is supposed to have existed in the early Pleistocene, there are some features in common, but the general aspect of Sussex man is more ape-like. The skull is, however, more human than simian, its distinctive features being a flattened form and thickened walls. It is not a close relative of any other type thus far found, but apparently belongs to a more or less distinct branch of the human family, not in direct line of ancestry to the present race.

At a meeting of the British association Professor Keith discussed the evidences as to the antiquity of man, and favored the view that in the distant past there was not one kind but several very different kinds of man, all of which have become extinct except that branch which has given rise to modern man. From the imperfect records afforded by the few bones that

have so far been uncovered, it seems probable that man began to take on his human characters near the beginning of the Pliocene period. Neanderthal man existed toward the end of the Pleistocene, while the Heidelberg type was of earlier date, possibly near the beginning of that period. To this latter stage also belonged the Java representative, *Pithecanthropus*. These represented two distinct types, neither of which was the direct ancestor of modern man. With the new discovery of the Sussex skull we have record of a third type which goes back much farther, in fact to the Pliocene Tertiary. The evidences show that man took on human characteristics near the beginning of the Pliocene, which Prof. Keith is inclined to place roundly at a million and a half years ago.

DYNAMIC GEOLOGY. As a continuation of his interesting experiments on the behavior of rocks under extreme pressures, Prof. F. D. Adams sought to determine the probable depth in the earth's interior at which rocks under the hydrostatic pressure of their superincumbent load would yield by flowage, thus closing all cavities. This zone of flowage has been estimated to occur at various depths; the conclusion reached by Van Hise, which has been most generally followed perhaps, indicated 12,000 meters. Two samples of rock were selected for experiment, one the Solenhofen limestone and the other Westerly granite, as representative of widespread types. These were subjected to pressures up to more than 100 tons to the square inch, at normal temperatures and under conditions of heat. It was found that granite at ordinary temperatures, under cubic compression such as obtains in the earth's crust, sustains a load of nearly 100 tons to the square inch, or more than seven times greater than the pressure that serves to crush it at the surface. With the gradient of temperature corresponding to the depth, it would appear that granite may resist flowage and closing of its cavities to a depth at least of 11 miles. Aside from its theoretic interest with regard to problems like those connected with isostatic adjustment, the work has an important economic bearing with reference to the extension of mineral veins in depth. This class of ore-deposits, as well as that arising from replacement, is dependent upon the agency of underground waters whose circulation is restricted necessarily to the zone where open cavities and pore-spaces occur. In view of the experiments, it would appear that such veins and replacements may be found within a range of at least 11 miles from the surface, or to a much greater depth than it is possible to follow them by any method of mining now employed.

In a study of the stratigraphical features known as conformity and unconformity, W. O. Crosby gives a clear explanation of their nature and meaning, with illustrations drawn from the coastal plain of eastern North America. The essential factor, as well as the chief interest, in unconformity pertains to the dynamic relations as expressed by erosion. Strata which are unconformable bear evidence of a double interchange between land and sea. The relation implies a considerable time break or hiatus, and thus arises somewhat incidentally the great value of unconformity in stratigraphic demarcation and classification. Conformity, on the other hand, signifies that depo-

sition was essentially continuous, that no true hiatus and consequently no period of erosion intervened during the accumulation of the strata that are conformable. Deposition may be infinitely slow, as in the great oceanic depression, but any apparent gap arising from such cause does not necessarily imply an unconformity. Localized erosion, like that due to shifting currents, is also not related to true unconformity. Examples of conformable and unconformable conditions of different character are to be found in the Atlantic coast province among the stratified formations which range in age from the Cretaceous to the present. The Cretaceous sediments were deposited on the eroded surface of older formations that had been profoundly deformed and metamorphosed before their submergence. This great unconformity is the joint product of deformation and erosion, and has greater importance than the numerous unconformities that occur later in the series and that are characterized by erosion alone. For the former type, in which the beds are discordant, Crosby proposes the name *clino-unconformity*; for the latter class, with accordant dip and strike, he proposes the term *para-unconformity*.

VOLCANISM. The underlying principles of volcanic activity have been considered by Daly, who views the earth as made up in its outer part of a siliceous shell that is overlain by the sedimentary mantle and underlain at a depth of 40 kilometers by a basaltic substratum. In the process of eruption this basaltic material forces its way through fissures into the outer part, where important changes begin to take place. The increase of volume in the magma affords energy for expanding the fissures, the superheat brings about more or less assimilation of the country rocks, and the gases occluded in the molten material will concentrate in the upper levels and under the roof of the bathylithic chamber. Various phases of volcanic action may then occur. Fissure eruptions are characterized by a superheated magma, always of basaltic nature; they involve thus the substratum rock alone, without assimilation of the acid country rocks. This phase may be conditioned by a narrow feeding channel. A second phase is called eruption through local foundering, which is conceived as taking place when the magma is of great proportions and superheated sufficiently to allow extensive assimilation of the overlying solid material. This assimilation alters the composition, giving rise to differentiation which results in the collecting of the siliceous rock varieties at the top. The upper portions may overflow and produce a rock mass somewhat similar to a fissure eruption, but differing in its acid character. The rhyolite sheet in Yellowstone Park is thus explained. The third phase is the central eruption, exemplified by modern volcanoes. In this the gases play an important rôle, assisting in opening the vent by abrasive and melting action, and through reactions between themselves liberating the energy to maintain the eruption of the rock through the vent. Bathyliths are the result of main abyssal injections. Plutonic stocks and bosses are the cupolas in bathylithic roofs. Sheets, dikes, and laccoliths are satellite and soon lose their thermal and hydrostatic communication with the main abyssal injection. The hypothesis is, of course, largely speculative, inasmuch as the data with which

it deals are very obscure or even beyond the horizon of direct observation; it represents, however, an interesting attempt to develop a reasonable explanation on the basis of generally accepted geological principles.

CRYSTALLINE SCHISTS. The origin of the foliated crystalline rocks has long engaged the attention of geologists, and one of the later contributions on the subject is by Trueman. The paper is especially valuable for its review and critical tests of previous work. A two-fold derivation of gneisses is recognized, according as they have received their foliation during consolidation from a molten state, in which case they are classed as primary, or as their foliation has been developed by secondary processes, which is regarded as the more common condition. The recognition of primary gneisses is rather a matter of field than laboratory study. A more common problem is presented to geologists in the separation of the sedimentary derivatives from the igneous members in the secondary class. The criteria that may be used in its solution include texture, chemical analysis, and the presence of certain minerals, which have a limited range of occurrence or possess different characters when found in the two groups.

Of much more general importance than might be inferred from its title perhaps is *The Geology of the Lake Superior Region*, a work in which Van Hise and Leith have brought together the results of long-continued investigation by themselves and their predecessors in this very remarkable section of old crystalline rocks. There is perhaps no other similar area anywhere that has received so thorough a study or that has gained so prominent a place in the literature relating to the Pre-Cambrian formations. Its interest lies in the great variety of the rocks, which are representative of all the stratigraphic divisions from the Archean to the Cambrian systems, in the metamorphic and structural features which the rocks exhibit; and in the extensive mineral resources of the region, especially those of copper and iron. The different aspects of the subject are fully and clearly treated by the authors who have been foremost among the interpreters in this classic field. Among the broader features of the geology of the region, as now made known, are the dominance of igneous formations in the basal or Archean portion, the rocks of which show evidence of uplift and profound erosion at a very early period. Upon this eroded basement were deposited the Lower Huronian strata, of terrestrial and marine origin. Then successively came the Middle and Upper Huronian, mainly of marine deposits, separated by a great unconformity. The Keweenaw system of terrestrial accumulations followed after another time gap. The iron ore deposits within the region are estimated to contain nearly two billions of tons and up to 1910 had produced about one-fourth of that amount. In regard to their origin the earlier theories enunciated by Van Hise have been largely revised in the light of more detailed study; the view is now held that the deposits were formed largely by chemical precipitation in sea water. The iron is supposed to have been abstracted from volcanic rocks either through magmatic solutions which poured into the sea or from the action of the saline waters upon submarine volcanic flows.

After deposition as stratified beds the iron deposits were uplifted and broken by regional forces exposing them to oxidation and the concentrating action of ground waters which have enriched the ores to the present state. The copper ores in the Keweenaw beds are also considered to have been derived from volcanic sources, in particular from the basaltic intrusions found within the stratified series.

ORE DEPOSITS. Among the contributions to mining geology may be noticed Weed's *Geology and Ore Deposits of the Butte District, Montana*, one of the series of monographs on the more important mineral districts issued by the United States Geological Survey. This volume will appeal to students on account of the historic relation which its subject bears to the development of knowledge in regard to mineral veins. The principle of secondary enrichment, perhaps the most signal feature in the recent progress of applied geology in America, was first clearly enunciated in connection with the Butte mines. In practical value the volume has suffered not a little from its delayed appearance, as the field studies were completed as far back as 1905. This has, perhaps, been a help from the scientific standpoint, for it shows evidences of mature reasoning in the treatment of the very complicated problems which are involved. The Butte district, it may be noted, ranks first among the copper districts of the world. In the last 20 years, the period of its greatest activity, it has contributed about five and a half billions of pounds of copper, besides important quantities of silver and some gold.

PETROLEUM. A novel explanation of the origin of petroleum was proposed by Murray Stuart in a paper on the Burma oil-fields, included in the reports of the Indian geological survey. According to the usual theory petroleum results from the distillation of organic matter in deeply buried rocks under the influence of heat and pressure. The alternative proposed by Stuart is that the oil originates from decomposition of vegetal debris at the surface, chiefly in lagoons or swamps where the decomposition is facilitated by bacterial action. The oil would rise to the surface as formed, and if the lagoons were subsequently drained it would become commingled with mud and sand of the outflowing stream. By experiment it has been found that fine muds and clay have the property of carrying down or precipitating oil when mixed with water. In that way a sedimentary deposit of the fine materials with the mechanically entangled oil might accumulate on the beds of streams and after the lapse of time become consolidated by burial under a load of overlying sediment. The theory has been worked out with especial reference to the Burma oil-pools, but the author holds that it may be applicable to other fields as well.

GEOPHYSICAL LABORATORY. See CARNEGIE INSTITUTION.

GEORGETOWN UNIVERSITY. An institution for higher education, under the auspices of the Roman Catholic Church, at Washington, D. C., founded 1789. The number of students enrolled in the various departments of the university in the autumn of 1912 was 1124. The faculty numbered 173. The most noteworthy event in the history of the university during the year was the appoint-

ment of the Rev. Alphonsus J. Donlon as president, to succeed Rev. Joseph J. Himmel, who had held that office from 1908 and was obliged to resign on account of ill health. The following noteworthy benefactions were received during the year: To the Georgetown University Hospital, \$45,000 from Mrs. E. Francis Riggs; for a wing for maternity cases, \$15,000 from Dr. George M. Kober. From Dr. Kober was also received a gift for the medical library. The volumes in the library numbered 121,000.

GEORGE WASHINGTON UNIVERSITY.

An institution of higher learning in Washington, D. C., formerly known as Columbian University, founded in 1821. The enrollment in all departments of the university in the autumn of 1912 was 1270. The faculty numbered 185. There were no noteworthy changes in the faculty during the year, and no important benefactions were received. The endowment amounted to about \$125,000. The total receipts for 1911-12 amounted to \$141,724. There were 44,500 volumes in the library. The president is Charles H. Stockton.

GEORGIA. POPULATION. According to the Census Bureau statistics issued in 1912, out of a total population in 1910 of 2,609,121 the foreign-born whites numbered 15,072, compared with 12,021 in 1900. The greatest proportion of these, 3224, came from Russia; from Germany, 3025; from England, 1650. Other European countries were represented by smaller numbers. In 1910 the negroes in the State numbered 1,176,987 and the mulattoes, 204,205. In 1890 the negroes numbered 858,815 and the mulattoes, 85,133. It will be noted that the negroes and mulattoes form a majority of the population of the State.

AGRICULTURE. The acreage, value, and production of the principal crops in 1911 and 1912 are shown in the following table:

		Acreage	Prod. Bu.	Value
Corn1912	3,910,000	53,958,000	\$45,864,000
1911	3,692,000	59,072,000	49,030,000
Wheat	..1912	132,000	1,228,000	1,498,000
1911	145,000	1,740,000	1,984,000
Oats	...1912	364,000	7,571,000	4,921,000
1911	404,000	8,686,000	6,480,000
Rye1912	11,000	101,000	141,000
1911	12,000	114,000	157,000
Rice1912	900	27,000	24,000
1911	1,450	39,000	30,000
Potatoes	..1912	12,000	936,000	814,000
1911	12,000	864,000	950,000
Hay1912	234,000 (a)	316,000	5,372,000
1911	87,000 (a)	117,000	1,989,000
Tobacco	..1912	1,400 (b)	1,162,000	349,000
1911	1,200 (b)	1,080,000	302,400
Cotton	...1911 (c)	2,560,000

(a) Tons. (b) Pounds. (c) Bales.

The iron ore produced in the State in 1911 was 207,279 long tons, compared with 313,878 long tons in 1910. The value of the product in 1911 was \$315,704, compared with a value of the product in 1910 of \$482,659.

MANUFACTURES. The Thirteenth Census statistics for the calendar year 1909 were compiled in 1912. Although Georgia is an agricultural rather than a manufacturing State, it has been for the past 60 years one of the leading and most progressive industrial States of the South. The increase in the five-year period, 1904-1909, is shown in the table given below:

	Number or Amount 1909	1904	P. C. of Inc. 1904-'09
Number of establishments	4,792	3,219	48.9
Persons engaged in manufactures . .	118,036	102,365	15.3
Proprietors and firm members	5,141	3,512	46.4
Salaried employes	8,307	6,104	36.1
Wage earners (average number)	104,588	92,749	12.3
Prim'y horsepower	298,241	220,419	35.3
Capital	\$202,778,000	\$135,211,000	50.0
Expenses	176,165,000	129,151,000	36.4
Services	43,867,000	33,320,000	31.7
Salaries	9,062,000	5,927,000	52.9
Wages	34,805,000	27,393,000	27.1
Materials	116,970,000	83,625,000	39.9
Miscellaneous	15,328,000	12,206,000	25.6
Value of products	202,863,000	151,040,000	34.3
Value of products less cost of materials	85,893,000	67,415,000	27.4

In addition to the data included in that table it may be noted that the industries devoted to lumber and timber products rank first in number, 1828. Manufactories of turpentine and rosin numbered 592; printing and publishing, 442; oil, cottonseed, and cake, 142; and cotton goods, including cotton small ware, 116. The cotton industry had the largest value of product, \$48,037,000; lumber and timber products, \$24,632,000; oil, cottonseed, and cake, products, \$23,641,000, and fertilizers, \$16,800,000. The total number of persons engaged in the manufacturing industries of the State in 1909 was 118,036. Of these 100,245 were male, and 17,791 female. Employees under 16 years of age numbered 6041. The prevailing hours of labor in the State ranged from 60 to 72 a week with the majority of those employed. Of all the wage-earners, 23.2 per cent. were employed in establishments where the prevailing hours were less than 60 a week and 1.4 per cent. where they were more than 72 a week.

EDUCATION. Children of school age in the State in 1912 numbered 735,471. The total enrollment was 565,071 and the average attendance, 352,059. The teachers numbered 13,024. The expenditures for common schools amounted to \$5,966,345. Of the total number of pupils enrolled, 342,129 were white and 22,942 colored. The attendance by white pupils was 221,381 and by colored, 130,678. The average monthly salary of white male teachers was \$64, and white female teachers, \$43.93; colored male teachers, \$26.52, and colored female teachers, \$20.56. The total number of schools was 7968, of which 4933 were for white pupils and 3035 for colored. The total expenditure for common schools in 1911 was \$5,065,229.

FINANCE. There was a balance in the State treasury at the beginning of the fiscal year 1911 of \$618,923. The total receipts for the fiscal year ending December 31, 1911, were \$5,558,447, and the total disbursements were \$5,450,284, leaving a balance at the end of the fiscal year of \$727,076. The chief sources of revenue are general tax, railroad tax, railroad rentals, and license fees. The chief expenditures are for education, for the maintenance of State institutions, and for the expenses of the State government. The outstanding bonds of the State at the end of the fiscal year were valued at \$6,834,202.

POLITICS AND GOVERNMENT. The legislature met in 1912 and passed no unusual measure.

CONVENTIONS AND ELECTIONS. The Republican convention for the choosing of delegates to the national convention met at Atlanta on February 14. The Taft forces were in control and although there were contesting Roosevelt delegates from several congressional districts they were not allowed to enter the hall. All the delegates chosen were pledged to vote for President Taft. The convention also gave the President a strong indorsement of his administration. Early in May, mass meetings were held throughout the State and delegates were elected to a convention to nominate Roosevelt delegates to the national convention. This was brought about largely through the efforts of Ormsby McHarg, who made a tour throughout the State advising voters that the convention held previously was illegal and that none of the delegates chosen would be seated in Chicago. This convention met and elected Roosevelt delegates. The regular Taft delegates, however, were seated by the national committee.

On July 17 the National Progressive party held a convention in the State. Dissensions arose among the delegates, and as a result two delegations from Georgia went to the National were seated by the national committee.

At the Democratic primary, held on May 1, Mr. Underwood defeated Governor Wilson by more than 8000 votes. The delegates to the Democratic national convention, therefore, went pledged to vote for Mr. Underwood. At a Democratic primary held on August 21, Senator Bacon was renominated and John M. Slaton was chosen as Democratic candidate for governor. In the election held on November 3, Governor Wilson received 93,171 votes, Mr. Roosevelt, 22,010, President Taft, 5190, and Debs, Socialist, received 1014 votes. The Democrats elected all the representatives in Congress.

On January 25 Joseph M. Brown was inaugurated governor of the State to serve until July 1, 1913, when John M. Slaton, nominated as noted above on August 21, will succeed him.

STATE GOVERNMENT. Governor, Joseph M. Brown (after July 1, 1913. J. M. Slaton); Secretary of State, Philip Cook; Treasurer, William J. Speer; Comptroller and ex officio Commissioner of Insurance, W. A. Wright; Attorney-General, Thomas S. Felder; Adjutant-General, W. G. Obear; Superintendent of Education, M. J. Brittain; Commissioner of Agriculture, J. D. Psico—all Democrats.

JUDICIARY. Supreme Court: Chief Justice, William H. Fish; Beverly D. Evans, Presiding Justice; Associate Justices, J. H. Lumpkin, M. W. Beck, Samuel C. Atkinson and Horace M. Holden; Clerk, Z. D. Harrison—all Democrats.

STATE LEGISLATURE, 1913. Democrats, Senate, 43; House, 183; joint ballot, 226. Republicans, Senate, 1; House, 1; joint ballot, 2. Democratic majority, Senate, 42; House, 182; joint ballot, 224.

The representatives in Congress will be found in the section *Congress*, article UNITED STATES.

GEORGIA, UNIVERSITY OF. An institution of higher learning at Athens, Ga., founded in 1785. The total enrollment in the various departments of the university in the autumn of 1912 was 700. The faculty numbered 65. Among the new members of the faculty in 1912 were Professor L. R. Geissler, in the chair of psychology, and Professor R. E. Curtis, in the chair of business administration. Several important additions were made to the faculty

in the department of agriculture during the year. Among the gifts received were \$12,500 from the Phelps-Stokes Fund, and \$40,000 from the Peabody Trust Fund, for the erection of the Peabody Educational building. The productive funds of the university amounted to about \$370,000, and the annual income to about \$220,000. There were 40,000 volumes in the library and 10,000 pamphlets. Chancellor, David C. Borrow, A. M.

GERMAN ANTARCTIC EXPEDITION.

See POLAR EXPLORATION.

GERMAN EAST AFRICA. A protectorate of Germany bordering on the Indian Ocean, between the British East Africa Protectorate and Portuguese East Africa. Area, as officially estimated, 995,000 square kilometers (384,170 square miles). The native population is unknown, but has been unofficially estimated at 7,000,000. White population, January 1, 1911, 4227, of whom 3113 German. There are government schools, and teaching is also carried on by the nine Evangelical and six Roman Catholic missions.

Products of the German plantations include coffee, cocoa, vanilla, tobacco, rubber, sugar, cotton, coconuts, and cardamoms. There are various mineral deposits, and many gems are found. Imports and exports, in thousands of marks: 1905, 17,655 and 9950; 1909, 33,942 and 13,120; 1910, 38,659 and 20,805. Exports in 1909 and 1910 included: Rubber, 2768 and 6195 thousand marks; sisal, 2333 and 3011; copra, 798 and 1909; ivory, 960 and 703; wax, 659 and 672; coffee, 887 and 838; hides and skins, 2030 and 2889; gold ore, 240 and 843; earth nuts, 233 and 596.

Railways, December 31, 1911: Northern (formerly the Usumbara), from Tanga to Kilimanjaro, 352 kilometers; Central, which is being built from Dar-es-Salaam to Ujiji, on Lake Tanganyika, via Tabora, 713 kilometers and 134 kilometers under construction; total in operation, 1065 kilometers. In January, 1912, the Central railway was opened to traffic as far as Tabora, 847 kilometers, and before the end of the year the railroad was over 150 kilometers beyond that town. Post and telegraph offices (1910), 42 and 30.

Estimated revenue for 1911-12 and 1912-13 respectively: Colonial revenue, 11,062,045 and 15,703,605 marks; imperial contribution, 3,543,790 and 3,618,307; loans, 17,615,000 and 17,250,000; total, 32,219,835 and 36,571,912. The estimated expenditures for the two years balanced the above totals and included the amounts of the loans as extraordinary. Governor (1912), Baron von Rechenberg; seat of government, the port Dar-es-Salaam (population about 26,000).

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA. A religious denomination, founded in 1840, as the Evangelical Association of the West. Its present name was adopted in 1877. It represents in doctrine the Prussian Union of 1877. Its strength is greatest in the central and north central States, although it is found in nearly all of the States of the Union. In 1912 the communicants numbered 254,995, the ministers 1058, and congregations 1343. The church property was valued at \$13,429,739. For the maintenance of churches there was spent \$1,218,253 and for benevolent purposes \$227,873. Missions are sustained in India, where the communicants and adherents

of the denomination numbered about 3500. The official organs of the denomination are *Der Friedensbote* and *The Messenger of Peace*, both published in the Eden Publishing House at St. Louis. The denomination sustains Elmhurst College at Elmhurst, Ill., and the Eden Theological Seminary at St. Louis. Charitable institutions are maintained for orphans, superannuated ministers, and the widows and orphans of deceased ministers. Nine institutions are engaged in deaconness work of the Kaiserswerth model.

GERMANIC PHILOLOGY. See PHILOLOGY.

GERMAN LITERATURE. The older generation of German writers is gradually being removed by death or is lapsing into silence and leaving the field to the youth it once opposed. It is quite evident that this youth rules the book market. The number of biographical and appreciative, rather than critical, monographs on writers still in their prime and capable of further development, is increasing. Complete uniform editions are also being published. All these publications have an air of finality which previous generations reserved for a time when an author's creative work was well-nigh ended. The old lament that the German poet comes into his own only after he is dead, is a thing of the past. The distinctions that have poured upon Gerhart Hauptmann, and at the occasion of his fiftieth birthday, the complete edition of his works, the new edition of Dr. Paul Schlenther's biography, originally published when the poet was only thirty-six, and finally the awarding of the Nobel prize, can also be considered a victory for his generation. But since he is the most perfect expression of the spirit of his race and his age, the honors bestowed upon him are well deserved. Arthur Schnitzler, the novelist and dramatist, who with due allowance for his Austrian temperament can be called another embodiment of the *Zeitgeist*, has also reached the half-century mark and been honored with a complete edition of his works. He has had an American success, too, the long run of *The Affairs of Anatol* in New York. But in his native Vienna, Schnitzler has experienced an official rebuff, his play *Professor Bernhadi* having been barred from public production. This incident is one of three within the year to remind German authors that censorship is not abolished. The other cases occurred in Munich, where an unpublished play by a new author, Leonor Goldschmied, was not even allowed a public reading, and the performance of Franz Dülberg's *Korallenkettlin*, a drama published some years ago, was prohibited. The latter work was finally produced in Bremerhaven, without disapproval on the part of the audience or interference from the authorities. Thus it would seem as if the ultramontane party in Austria and in Bavaria were responsible for the measures taken in Vienna and in Munich. Otherwise the year passed very quietly. No book published in 1912 could be called a work of the first literary importance, or met with a sensational success. The decline of the best seller, which was noted a year ago, is very marked; even the list of books most in demand has disappeared from the columns of literary magazines.

DRAMA. For Gerhart Hauptmann the year was marked by the performance at the little theatre of Lauchstedt, hallowed by Goethe tradition, of *Gabriel Schillings Flucht*, a

psychological drama written six years ago and not originally intended for public production. Max Halbe's comedy *Der Ring des Gauklers*, and Max Dreyer's domestic drama *Die Frau des Kommandeurs*, proved once more the futility of their efforts to repeat previous successes. Herbert Eulenberg, on the contrary, who had long in vain courted a stage success, surprised his critics with his *Belinde*, which was awarded the "Schiller Volkspreis." Walter von Molo, a young Austrian, made a successful début with a four-act play, *Die Mutter*. Another newcomer challenging attention is Gerdt von Basewitz, the author of the tragedy *Judas*. A woman dramatist came into great prominence, Hanna Rademacher, whose historical drama *Johanna von Neapel*, was received with great favor. Hermann Bahr is risking his reputation by being too prolific: his plays of the year are *Das Tänzchen* and *Das Prinzip*. Oscar Blumenthal's *Waffengang* is identical in style and calibre with the numerous plays produced in the thirty-five years of his career. Ludwig Fulda's *Seeräuber* will not enhance the author's reputation. Ludwig Thoma's *Magdalena* proved to be a Bavarian peasant tragedy of almost cold-blooded realism. Josef Schandler's *Nachtrab* is a delightful Munich comedy. Wilhelm Weigand's *Könige* and *Psyche's Erwachen* have great poetical qualities and Franz Dülberg's *Cardenio* presents a novel version of a story previously dramatized by Immermann and others. Leo Birinski's *Narrentanz*, founded like his *Moloch* upon the Russian revolution, has not been taken seriously by the critics. Frank Wedekind is being more and more generally accepted as a serious representative of the intellectual and moral fermentation going on in modern Germany, even his Faustian *Franziska*, a recently published play which he calls a "Mysterium," having been favorably noticed.

POETRY. There have been few noteworthy books of verse this year. Ernst Lissauer's *Der Strom* stands foremost, being full of striking images and remarkably condensed in feeling and form. A volume of posthumous verse by Wilhelm Holzamer is a precious legacy, for his untimely death cut short the development of rare gifts. Hanns von Gumpenberg's *Schauen und Sinnen* is a book containing many a line of genuine lyric sweep. Alfons Pacquet's *Held Namenlos* shows his strong sense for the romance of reality. Two books of verse have come from Carl Meissner: *Der schwarze Wag* reflects with some bitterness the limitations of provincial life; *Im Schauen der Dinge* is based upon a more philosophical acceptance of life. A new edition of Maria Janitschek's poems is distinguished by the symbolistic quality and the rhapsodic ring with which she struck a new note some years ago. Maria Stöna's new volume of poems, *Flammen und Blüten*, also proves that she has lost none of the intensity and the tenderness of her earlier lyrics. Ricarda Huch is the peer of her sisters; her new book, *Gedichte*, reflects an artistic temperament held in leash by the unerring taste of a rarely cultured mind. A monumental anthology is Bruno Wille's work in two volumes: *Die Walddichter fremder Zunge und Schätze aus ihren Werken von dem Veden bis Tolstoi*.

FICTION. That this year of honor to Gerhart Hauptmann should terminate with the publica-

tion of his novel *Atlantis*, which appeared simultaneously in Germany and America, is in a manner to be regretted, as the work is inferior in construction and in style to his *Fool in Christ*. But it has a strong psychological interest and in the medical knowledge with which it describes the effects of a shipwreck upon the mind of the hero, is typical of the modern German tendency of welding science and art. A noteworthy achievement is George Hermann's story *Die Nacht des Doktor Herzfeld*, which also incidentally touches with commendable discretion upon a recent medical discovery of great importance. Hermann Stegmann, an Alsatian writer of great power, has published two novels, *Thomas Ringwald* and *Die Himmelspacher*, both remarkable for the virile wholesome type of their heroes and for his plastic visualization of dramatic conflicts. Wilhelm Scharrelmann, a most sympathetic reader of the child-soul, has written a touching and truthful story of child-life in tenement lodgings: *Piddl Hundertmark*. Gerhard Ouckama Knoop, one of the most striking individualities in German fiction, has chosen a Dutch landscape for the background of a story of rapid rise to wealth and rank, and as rapid decline: *Die Hochmögenden*. Walter Harlan's *Catrejn's Irrfahrt* is a story of old Flanders. Rudolf Hans Bartsch, the Austrian novelist, has written a delightful novel based upon the life of Franz Schubert, *Schwammerl*, the very title suggesting its local atmosphere and intimate charm. His compatriot Wilhelm Fisher-Graz traces the development of a girl of humble birth to noble womanhood in a story, *Aus der Tiefe*, of which the scene is Steiermark during Napoleon's campaign. Max Dantendey, the poet, makes his début as novelist with *Raubmenschen*, a powerful story of a German's experience in Mexico. A young Swiss writer of promise is hailed in Alexander Castell, whose novel *Bernards Versuchung*, has a touch of Gallic worldliness and grace. The new book by Emil Strauss, *Der nackte Mann*, presents scenes of court and town life and has a most sympathetic aristocratic heroine. It would seem as if the experiences of Louise of Saxony had directed the attention of some writers to this type of womanhood and the tragedy of lives hedged in by the conventions of their caste, for Kurt Aram in his *Baronin Gorn*, and Adolf Paul in his *Dornröschen* also treat this theme. Oscar A. H. Schmitz, in a somewhat exaggerated and highly colored manner, presents a picture of manners and morals in that numerous class of modern Germany, which has emancipated itself from the code of the bourgeoisie and apes Bohemia, in a novel called *Wenn wir Frauen erwachen*. A Jewish writer, who by his novels and dramas has been steadily attracting more and more attention, Schalom Asch, has written a story of the recent Russian revolution, *Die Jüngsten*. The far too prolific Georg von Omptada has two books to his credit: *Die Tochter des grossen Georgi*, a story of actor life, and *Der zweite Schuss*, a novel dealing with the problem of honor. Among women novelists, Franziska Mann occupies a place of her own: *Frau Sophie und ihre Kinder*, is a noteworthy example of her sympathetic insight into the woman- and child-soul. Elisabeth Stewart has succeeded in telling with absorbing interest a story of life in a provincial parish fifty years ago: *Un-*

vergessene Menschen. Among the numerous volumes of short stories Carl Hauptmann's *Nächte* is typical for his sympathetic understanding of eccentric characters and unusual conflicts. Arthur Schnitzler's *Masken und Wunder* is admirable for his artistic handling of daring problems. Hermann Hesse's *Umwege* tells of plain people who go a roundabout way to their predestined simple goal. Anna Croissant-Rust delightfully blends humor and pathos in her record of human lives, called *Arche Noah*. But the most charming collection of short tales and sketches of everyday life is Walter Harlan's book entitled *Familien szenen*. There is a rare literary flavor about *Die goldene Fratze*, a volume of short stories by the Swiss writer, Jakob Schaffner, and about Richard Hudschiner's *Narren der Liebe*.

HUMOR. TRAVELS. ESSAYS. The year's best book of humor is Rudolf Presber's volume entitled *Das goldene Lachen*. In the travel books of the German market, America is beginning to play a more and more important part. Arthur Holitscher's *Amerika-heute und morgen* is a most thoughtful record of experiences and impressions. Kurt Aram entitles his book *Mit hundert Mark nach Amerika*. Alfons Pacquet's *Li* is a fascinating account of travels outside of the tourist's beaten track in Siberia, China, and Japan. A book of clever reflections and keen observations in W. Fred's *Impressionen*, bearing the appropriate sub-title "notes of an itinerant journalist." Alpine literature has received a noteworthy addition in Alfred Steinitzer's sumptuously illustrated book, *Der Alpinismus in Bildern*. A selection of the writings of Ferdinand Gregorovius has been published, called *Wanderjahre in Italien*. Hermann Bahr seems to have collected a multitude of scraps from his workshop in the three books entitled *Essays, Austriaca, and Inventur*, which are of varying calibre and interest. Karl Schaffler's *Essays* are rich in æsthetical suggestions. Otto Pniower's *Dichtung und Dichter* is an interesting commentary on contemporaneous literature. Felix Poppenberg's *Maskenzüge* is a most fascinating volume of impressions of men, women, art, and nature.

LITERATURE. Books on literature have been very numerous in the year's output, but few of them are of permanent interest. Karl Bleibtreu has written a *Geschichte der deutschen Nationalliteratur von Goethe's Tode bis zur Gegenwart*, and Georg Witkowski covers about the same ground in *Die Entwicklung der deutschen Literatur seit 1830*. Eduard Engle has written a *Geschichte der französischen Literatur von Anfang bis zur Gegenwart*. Willamowitz-Möllendorf has collaborated with others on a monumental work called *Die griechische und römische Literatur und Sprache*. A posthumous volume by Heinrich Bulthaupt contains his *Literarische Vorträge*. A noteworthy addition to Goethe literature is *Goethe und die Antike*, by Ernst Maass. There is also a new revised edition of Georg Witkowski's *Goethe*, and of Johannes Scherr's *Shiller und seine Zeit*.

BIOGRAPHY. MEMOIRS. HISTORY. Psychological interest is mainly responsible for the continual stream of books on Friedrich Hebbel and Heinrich von Kleist. Notable among them are Walter Block-Wunschmann's *Friedrich Hebbel, ein Lebensbuch*, and Julius Hart's *Kleistbuch*. Nietzsche-literature has been increased by Elisabeth Förster Nietzsche's record

of the poet-philosopher's youth: *Der junge Nietzsche*, and by Prof. Richard M. Meyer's work, *Nietzsche, sein Leben und seine Werke*. Dr. Emil Reicke presents a sympathetic study of *Malvida von Meysenburg*, the remarkable woman who by her friendship for Herzen, Wagner, Nietzsche, and Romain Rolland, has inscribed herself indelibly in the intellectual annals of the century. An important contribution to Bismarck-literature is Emil Ludwig's *Bismarck*, a remarkable record and interpretation. Noteworthy memoirs are Paul Heyse's *Jugenderinnerungen und Bekenntnisse* and Johannes Trojan's *Erinnerungen*. Additions to the history of Germany are Prof. Wilhelm Stölze's book, *Die Gründung des deutschen Reiches im Jahre 1870*, a book of reminiscences by Sigmund Münz, called *Von Bismarck bis Bülow*, Dr. Bernhard Rogge's recollections: *Bei der Garde* and Dr. Theodor Schiemane's year-book *Deutschland und die grosse Politik anno 1911*. Of new editions must be noted Johannes Scherr's *1848, ein weltgeschichtliches Drama*, and *1870-1, vier Bücher deutscher Geschichte*.

PHILOSOPHY. RELIGION. FOLKLORE. ART., etc. A notable contribution to the literature of philosophy is Dr. Hans Driesch's *Ordnungslehre*. Of the seriousness with which German thinkers seek a new reading of life there are many evidences, among them Dr. Alfred Weber's *Religion und Kultur*, Arthur Bonus's *Religiöse Spannungen*, and Dr. Gottfried Traub's *Staatschristentum oder Volkskirche*, and *Ich suchte dich Gott*. Of curious human and historical interest is Dr. Max Kemmerich's book *Aus der Geschichte der menschlichen Dummheit*, dealing with superstitions surviving in parts of Bavaria. An enterprise of great cultural importance is the collection of Norse sagas and stories entitled "Thule," of which the latest volume is a book of Greenland stories by Erich von Mendelssohn: *Grönländer und Färinger Geschichten*. A book which stands perhaps unique in the literature of folklore is Dr. Barthold Rein's volume of well-lore: *Der Brunnen im Volksleben*. Among the numerous books on art are some interpretations combining technical knowledge with literary flavor; foremost among them Julius Meyer-Gräfe's book on *Hogarth*, and his works on the Impressionists, on some English masters, Hans von Marées, Cézanne, Van Gogh and others. Karl Schaffler, one of Germany's ablest critics, is the author of a book on *Max Liebermann*. A volume of unique and timely interest is Franz Feldhaus's *Lionardo der Techniker und Erfinder*, dealing with Lionardo's achievements as a mechanical genius and especially his experiments with flying-machines, in which he anticipated our dirigibles and aeroplanes. An interesting interpretation of the "Upanishads" is presented in a unique form in *Das hohe Ziel der Erkenntnis*, by the late Omar al Raschid Bey, a German scholar naturalized in Turkey. Gustav F. Steffen is a writer on economics, whose work is attracting attention and who in *Die Grundlagen der Soziologie* offers a new conception of this science. Prof. Werner Sombart, whose book *Die Juden und das Wirtschaftsleben*, is being translated into English, created no little excitement by *Die Zukunft der Juden*, in which in the interest of preserving unadulterated the valuable qualities of the Jewish race he declares against intermarriage and assimilation.

NEW EDITIONS AND TRANSLATIONS. New

editions of the German classics are almost too numerous to mention. Those most frequently reëdited are Goethe, Schiller, Kleist, Heine, and Hebbel, but there have also been new editions of Kant, Lessing, Körner, Börne, Holderlin, Brentano, E. T. A. Hoffmann, Immermann, and others. Of the more recent writers those who are available in complete editions are Hermann Conradi, Richard Dehmel, Otto Julius Bierbaum, Detlev von Liliencron, Gerhart Hauptmann, and Arthur Schnitzler. There is a new edition of the Bible revised from Luther's text by Hermann Hesse. There is also a facsimile reprint of the "Bible of Mayence," the "zweundvierzigzeilige Bibel von Johannes Gutenberg." Proof of the reviving interest in historical documents of the Middle Ages is the new edition of the memoirs of Hans von Schweinichen, a knight-errant of Silesia; *Memorial-Buch der Fahrten und Taten des schlesischen Ritters, Hans von Schweinichen*, covering the latter half of the sixteenth century. Translations from the world's literature are also very numerous. One of the most interesting is the new edition of the *Decameron*, translated by Albert Wesselski and illustrated by reproductions of the woodcuts of the Venice edition of 1492. An edition of the complete works of Poe translated by Theodor and Gisela Etzel is remarkable for the illustrations by Alfred Kubin, whose weird drawings prove him to be a spiritual brother of Poe.

DEATHS. Death has removed Alfred Freiherr von Berger, poet, dramatist and critic, and director of the Burgtheater of Vienna, Felix Dahn, poet and novelist, Josef Ettlinger, critic and founder of the *Literarische Echo* and the *Freie Volksbühne*, Rochus Freiherr von Liliencron, one of the most versatile scholars of Germany, Anton von Perfall, the novelist, Arthur Pfungst, poet and founder of the *Monistenbund*, Albert Träger, poet, and Irma von Troll-Borostyani, novelist and advocate of woman's rights.

GERMAN MUSIC. See MUSIC.

GERMAN NAVY LAW. See NAVAL PROGRESS, *England, General Progress.*

GERMAN NEW GUINEA. A protectorate of Germany including Kaiser-Wilhelms-Land (the northeastern part of New Guinea island) and the Bismarck Archipelago. Officially estimated area, 240,000 square kilometers (92,664 square miles). The native population is estimated at about 530,000; white (January 1, 1911), 723, of whom 578 German. Imports and exports in 1909, 2,666,000 and 2,459,000 marks; in 1910, 3,891,000 and 3,623,000. Of the 1910 imports, 2,915,000 marks were attributed to the Bismarck Archipelago, and of the exports 3,224,000; of the totals, 1,686,000 marks imports were from 2,370,000 marks exports to Germany. Vessels entered (1910), 437, of 408,000 tons. The budget for 1911-12 balanced at 2,183,421 marks (including imperial subvention 759,597); for 1911-13, 2,764,128 (subvention 1,207,543). Governor (1912), Dr. Hall; seat of government (formerly Herbertshöhe), Rabaul, in Neu-Pommern.

Attached to German New Guinea are the other German Pacific dependencies (Caroline, Palau, Mariana, and Marshall islands), except Samoa and Kiaochow. These dependencies have an estimated area of 2572 square kilometers (956 square miles), with about 53,000 inhabitants; whites (January 1, 1911), 320, of whom

194 German. Imports and exports, in 1910, of the East Caroline Islands, 318,000 and 211,000 marks; West Caroline, Palau, and Marianas, 740,000 and 1,453,000; Marshall Islands, 1,297,000 and 9,378,000. Imports of the German Pacific possessions (including Samoa, but excluding Kiaochow), were 65,464,000 marks in 1909 and 69,375,000 in 1910; exports, 54,732,000 and 60,561,000. The German Solomon Islands are included with Kaiser-Wilhelms-Land.

GERMAN NEW GUINEA. See ANTHROPOLOGY.

GERMAN SAMOA. A protectorate of Germany in the South Pacific, consisting of the two largest of the Samoan Islands (Savaii (652.9 square miles) and Upolu (335.5), together with Manono (3.3) and Apolima (1.8); total area, 993.5 square miles. Population, about 37,500; of whom native Samoans number about 34,000; whites (January 1, 1911), 490, of whom 284 German. Imports and exports in 1909, 3,338,000 and 3,022,000 marks; in 1910, 3,462,000 and 3,534,000. The export is almost wholly copra, 3,022,000 marks in 1909 and 3,534,000 in 1910; Cacao, 406,000 and 555,000. The budget for 1911-12 balanced at 932,155 marks; 1912-13, 949,815. The estimates for these years included no imperial subvention. Governor (1912), Dr. Schultze; seat of government, Apia, in Upolu.

GERMAN SOLOMON ISLANDS. A German possession included with Kaiser-Wilhelms-Land. It includes the island of Bougainville.

GERMAN SOUTHWEST AFRICA. A protectorate of Germany between Angola and the Cape Province. Area, as officially estimated, 835,100 square kilometers (322,432 square miles). Colored population, about 82,000; whites (January 1, 1911), 13,962, of whom 11,140 Germans. The most important industry is stock-raising; livestock in 1910 included 121,139 cattle, 343,989 sheep, and 327,095 goats; in 1911, sheep for shearing 32,200, sheep for slaughter 381,000. Valuable diamond fields are worked in the neighborhood of Lüderitzbucht; diamond output in the year ended March 31, 1911, 814,322 carats. Imports and exports in thousands of marks: 1905, 23,632 and 216; 1907, 32,396 and 1616; 1909, 34,713 and 22,071; 1910, 44,344 and 34,892. Leading exports in 1909 and 1910: Diamonds, 15,026 and 26,869 thousand marks; copper ore, 4655 and 5697; lead, 982 and 861; hides, 135 and 145. In 1909 and 1910, imports from Germany, 26,390,000 and 34,455,000 marks; exports to Germany, 18,158,000 and 28,674,000. Railways at the end of 1911: Otavi railway, 671 kilometers; Swakopmund-Windhuk railway, 382; North-South railway, 311 (and 195 under construction); Lüderitzbucht railway, 545; 1909 kilometers (1186 miles), in operation and 195 kilometers (121 miles) under construction. Early in 1912 the line between Windhoek and Keetmanshoop was completed, connecting the Northern and Southern systems of railway. Post offices, 68. The budget for 1911-12 balanced at 43,998,022 marks, including 11,415,858 marks imperial subvention and 9,000,000 marks loans; for 1912-13, 45,019,312 marks, including 13,828,346 marks subvention and 9,000,000 marks loan. Governor (1912), Dr. Seitz; seat of government, Windhuk.

GERMANY. The German Empire, *das Deutsche Reich*, extending from France to Rus-

sia, consists of twenty-five federated states and the imperial territory (Reichsland) of Alsace-Lorraine. Capital, Berlin.

AREA AND POPULATION. The area in square kilometers and equivalent square miles, according to the most recent calculations, and the population, according to the census of December 1, 1910, are shown by states in the following table (*k* kingdom, *g* grand duchy, *d* duchy, *p* principality, *ft* free town, *r* Reichsland):

	Sq. km.	Sq. mi.	Pop. '10
Prussia (<i>k</i>)	348,779.9	134,663.9	40,165,219
Bavaria (<i>k</i>)	76,870.2	29,293.5	6,887,291
Württemberg (<i>k</i>)	19,507.3	7,531.8	2,437,574
Saxony (<i>k</i>)	14,992.9	5,788.8	4,806,661
Baden (<i>g</i>)	15,070.3	5,818.6	2,142,833
Mecklenburg-Schwerin (<i>g</i>)	13,126.9	5,068.8	639,958
Hesse (<i>g</i>)	7,688.4	2,969.5	1,282,051
Oldenburg (<i>g</i>)	6,429.1	2,482.3	483,042
Brunswick (<i>d</i>)	8,672.0	1,417.8	494,339
Saxe-Weimar (<i>g</i>)	3,510.0	1,393.8	417,149
Mecklenburg-Strelitz (<i>g</i>)	2,929.5	1,131.1	106,442
Saxe-Meiningen (<i>d</i>)	2,468.3	952.8	278,762
Anhalt (<i>d</i>)	2,299.4	887.8	331,128
Saxe-Coburg-Gotha (<i>d</i>)	1,976.8	763.2	257,177
Saxe-Altenburg (<i>d</i>)	1,323.5	511.0	216,128

Total 1870	40,818,000	1905	60,641,000

Of the population present in 1910, 30,040,166 were males, and 32,885,827 females. On June 30, 1911, the estimated population of the empire was 65,429,000, and of the Zoolgebiet 65,671,000; 1912, 66,303,000 and 66,547,000. In 1871, the year of the empire's establishment, the population was 41,058,792, and the average annual increase to 1880 was 1.08 per cent.; from 1880 to 1890, 0.89; from 1890 to 1900, 1.31; and from 1900 to 1910, 1.41. In 1871 the population per square kilometer was 75.9 (196.6 per square mile); in 1910, 1200 (310.8).

The foreign population at the 1910 census was 1,259,873 (716,994 males, 542,879 females), of whom 634,983 Austrians, 144,175 Dutch, 137,697 Russians, 104,204 Italians, 68,257 Swiss, 32,079 Hungarians, 26,233 Danes, 19,140 French, 18,319 British, and 17,572 Americans. Evangelicals numbered 39,991,421 (61.6 per cent.); Roman Catholics, 23,821,453 (36.7); other Christians, 283,946; Jews, 615,021; others, 214,152.

Communal population of the larger cities (including the military) according to the census of December 1, 1910: Berlin, 2,071,257; (Greater Berlin, 3,710,000); Hamburg, 932,116; Leipzig, 626,267; Munich, 608,375; Dresden, 551,697; Cologne, 516,527; Breslau, 514,765; Frankfurt-on-the-Main, 414,576; Düsseldorf, 358,728; Nuremberg, 333,142; Charlotten-

burg, 305,978; Hannover, 302,375; Essen, 294,653; Chemnitz, 287,807; Stuttgart, 286,218; Magdeburg, 279,629; Bremen, 247,437; Königsberg, 245,994; Stettin, 237,419; Neukölln (formerly Rixdorf), 237,299; Duisburg, 229,483; Dortmund, 214,226; Kiel, 211,627; Mannheim, 202,115; Halle, 180,843; Strassburg, 178,891; Berlin-Schöneberg, 172,823; Altona, 172,628; Danzig, 170,337; Elberfeld, 170,195; Gelsenkirchen, 169,513; Barmen, 169,214; Posen, 156,691; Aachen, 156,143; Cassel, 153,196.

In 1910 the marriage rate per thousand inhabitants was 7.7, birth, 30.7, death, 17.1, living births, 29.8; stillbirths, 2.9 per cent.; illegitimate births, 9.1 per cent. Movement of the population from 1907 to 1910:

	1907	1908	1909	1910
Marriages	503,964	500,620	494,127	496,396
Births*	2,060,973	2,076,660	2,038,857	1,982,836
Stillbirths	61,040	61,607	63,079	58,057
Deaths*	1,178,349	1,197,098	1,154,296	1,103,723

* Including stillbirths.

In spite of the fact that the average annual increase in the first decade of the century (1.41 per cent.) was greater than in the preceding decade (1.31), and that the death rate declined from 19.0 in 1907 to 17.1 in 1910, it is believed that the rate of population increase is no longer advancing; the marriage rate declined from 8.1 in 1907 to 7.7 in 1910, and the birth rate from 33.2 to 30.7. The movement in the death rate is similar to that of other countries where modern medical science is widely applied. The movement in the marriage rate, and more particularly in the birth rate, reflects a condition normal in a population tending rapidly cityward. Also, in a civilized community the birth rate shows, within certain limits, an inverse relation to the diffusion of artificial refinements. The falling birth rate, long conspicuous in France, is just beginning to be noticeable in Germany.

In 1910 German emigrants numbered 25,531; in 1911, 22,690, of whom 18,900 to the United States, 511 to Canada, 363 to Brazil, and 2554 to other American countries.

AGRICULTURE. In 1907, 27.95 per cent. of the population were supported by agriculture, against 34.9 per cent. in 1895. The area harvested, in thousands of hectares, and the yield in metric quintals, in 1911 and 1912, with yield per hectare in 1911, are shown below:

	Hectares		Quintals		Qs.
	1911	1912	1911	1912	ha.
Wheat	1,974	1,928	40,663,350	43,606,240	20.6
Rye	6,136	6,268	108,661,160	115,982,890	17.7
Barley	1,585	1,590	31,599,150	34,819,740	19.9
Oats	4,328	4,387	77,041,010	85,201,830	17.8

Harvest area of potatoes in 1910 and 1911, 3,296,219 and 3,321,479 ha., yield 434,683,950 and 343,742,250 qs.; meadow hay, 5,965,017 and 5,934,798 ha., yield 28,250,115 and 19,975,324 metric tons; vines, 112,506 and 110,053 ha., yield 846,139 and 2,922,886 hectoliters of must (2,020,620 in 1909). Tobacco production in 1910 was 288,542 qs.; in 1911, 292,047; hops, 204,110 and 106,277. The sugar beet is an important crop. For Prussia, the harvest area in 1911 and 1912 was 350,287 and 426,327 ha.; yield, 59,961,440 and 129,632,150 qs.

Latest livestock statistics available are for

1907: Horses, 4,345,047; mules and asses, 11,291; cattle, 20,830,544; sheep, 7,703,710; swine, 22,146,532; goats, 3,633,970; fowls, 77,103,045. Slaughter in 1911: Oxen, 559,698; bulls, 424,369; cows, 1,768,949; calves over three months, 982,284; calves up to three months, 4,577,982; sheep, 2,232,187; swine, 18,541,694; goats, 493,566; horses, 151,529; dogs, 6553.

Zinc ore ..	723.6	42,834	718.3	45,185
Lead ore ..	159.9	14,462	148.5	14,064
Copper ore	798.6	22,967	926.0	23,406
Total	253,572.7	1,980,469	263,167.8	2,008,708

As compared with 2,008,708 marks in 1910, the total value of mining products in 1905 was 1,417,719,000; in 1901, 1,313,873,000; in 1891, 775,701. The output of salts in 1910 (exclusive of rock salt and potash salts) was 1,769,500 tons, valued at 115,497 marks (of which common salt 669,100 tons, 19,262,000 marks, and potassium chloride, 741,300 tons, 72,984,000 marks).

Important reduction products, in thousands of metric tons, valued in thousands of marks:

	1919		1910	
	1000 t.	1000 m.	1000 t.	1000 m.
Pig iron	12,644.9	691,564	14,793.6	802,851

The foregoing totals for 1912, in miles:

Government railways.....	35,065	665	35,729
Private railways	2,213	711	2,924
Total	37,278	1,376	38,654

During 1912 the Berlin Elevated Railways were being extended from Christianstrasse to Weserstrasse, a distance of $5\frac{1}{2}$ miles. In Leipzig the new station was under construction and a portion was opened on May 1. It is to serve as a union station for all lines centring at this point and is to be put in service for that purpose in 1913. Extensions and additions to the lines connecting the German and Belgian railways were opened on July 1, the new lines aggregating 87 miles in length.

Telegraphs are owned by the imperial government, except in Bavaria and Württemberg; these kingdoms, under certain limitations, operate their own telegraphs and posts. Total telegraph offices (1911), 46,444 (45,116 in 1910); line, 228,560 kilometers (224,794); wire, 706,248 kilometers (676,091). Total post offices (1911), 40,987 (40,816 in 1910).

FINANCE. The monetary unit is the mark, worth 23.821 cents. The imperial budget adopted for the year ended March 31, 1912 (law of April 7, 1911), balanced at 2,924,790,000 marks (including extraordinary revenue and expenditure balancing at 216,975,817 marks). The budget for the year ended March 31, 1913 (law of May 28, 1912) balanced at 2,886,135,087 marks (including extraordinary revenue and expenditure balancing at 134,473,100 marks). Of the extraordinary estimated revenue for 1912-13, loans accounted for 130,674,439 marks; of the extraordinary estimated expenditure, 82,570,000 marks were for the navy. Larger sources of estimated ordinary revenue, 1912-13: Customs, excise, stamps, etc., 1,734,570,093 marks (customs 689,308,000, spirits excise 195,046,000, sugar 143,500,000, beer 122,100,000, stamps of the empire 187,741,500); posts and telegraphs, 791,381,000; railways, 141,780,000; matricular contributions of the

several states (exclusive of their contributions from spirits excise), 51,940,794 (Prussia 33,498,900). Larger estimated expenditures, including ordinary (permanent and transitory) and extraordinary, 1912-13: Military administration, 827,795,405 marks (against 815,670,790 estimated for 1911-12); posts and telegraphs, 714,009,235 (684,696,385); administration of the navy, 470,433,623 (458,033,686); debts of the empire, 240,032,521 (285,748,054); pensions, 143,411,248 (153,798,446); interior, 123,017,171 (140,843,167); administration of railways, 124,343,651 (122,490,005).

In October, 1911, the interest-bearing debt of the empire was 4,823,656,700 marks, having decreased 72,976,800 marks since 1910. Non-interest-bearing debt: Treasury bonds, 300,000,000 (having increased 54,000,000 since 1910); paper money, 120,000,000. Total debt, 5,243,656,700 marks (the decrease from 1910 being 18,976,800). A war fund of 120,000,000 marks in gold is kept at Spandau.

ARMY. Under the terms of the Quinquennial law, voted by the Reichstag in March, 1911, increases in the strength of the German army were being made with the idea of securing a peace strength of 515,221 in 1915-16, this being an increase of 9428 over the law of 1905. On March 22, 1912, the Reichstag, however, took up proposals for a still further increase of the army and its reorganization, which became law on June 14. This law of 1912 increases the peace strength to 544,211, to be distributed as follows: Prussia, 420,939; Bavaria, 60,351; Saxony, 41,625; Württemberg, 21,296. Adding non-commissioned officers and the one year volunteers this would give a total strength of over 658,200 men. The new law provided for the formation of two army corps (to be known as the 20th and 21st) with headquarters in East Prussia and Alsace-Lorraine respectively and the creation of 18 new infantry battalions and large increases to the machine-gun companies. Various steps in the reorganization were to be accelerated and the two new corps were formally constituted on October 1, 1912. As a result, at the end of the year the German army was organized in 25 army corps and 3 Bavarian corps, and on October 1, 1912, consisted of 648 battalions of infantry, 510 squadrons of cavalry, 633 batteries of field and horse artillery, 42 battalions of foot artillery, 31 battalions of pioneers, 18 of transportation troops, and 25 battalions of train. During the following two years it was proposed to increase this organization to 651 battalions, 516 squadrons, 633 batteries, 49 battalions of foot artillery, 33 battalions of pioneers, 18 of transportation troops, and 25 of train. Service in the German army is compulsory, every citizen with certain exceptions being liable for service from his 19th to his 45th year, spending 7 years in the regular army, either with the colors or in its reserve, 5 years in the first levy of the Landwehr, 10 years in the second levy and finally with the Landwehr home defense army, until the end of his 55th year. This general plan is modified in the case of the cavalry and the horse artillery, which requires 3 years of uninterrupted service with the colors instead of 2 as in other arms of the service, while the Ersatz Reserve is maintained from the surplus of recruits over those required for the regular army.

From October 1, 1912, when the reorganiza-

tion became effective, the effective strength of the German army was 655,714 men, of whom 27,037 were officers, 236, medical officers, 810 veterinary surgeons, 1154 paymasters, 2 band inspectors, 1193 armorers, 92,347 under officers and 531,004 privates. The men were distributed into four contingents, 412,346 being Prussians, 39,834 Saxons, 20,244 Württembergers and 58,580 Bavarians. The number of horses was 126,480. These figures may be compared with those of the 1911 budget, which provided for 626,489 men, of whom 507,253 were privates, 25,650 officers, and 86,453 under officers. The number of horses was 118,246. See MILITARY PROGRESS.

NAVY. Number and displacement of warships of 1500 or more tons, and of torpedo craft of 50 or more tons, built and building, December 1, 1912: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 inches or more in calibre): built, 10 of 212,380 tons; building, 7 of 172,330 tons. Pre-dreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre): built, 20 of 242,800 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): built, 3 of 12,203 tons; building, none. Battle cruisers (armored cruisers having guns of largest calibre in main battery): built, 3 of 64,364 tons; building, 3 of 75,000 tons. Armored cruisers: built, 9 of 94,245 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 88 of 135,636 tons; building, 5 of 27,065 tons. Torpedo-boat destroyers: built, 119 of 63,014 tons; building, 12 of 8280 tons. Torpedo boats: built, 9 of 1600 tons; building, none. Submarines: built, 26 of 11,740 tons; building, 6 of 3600 tons. Total tonnage: built, 837,982; building, 286,275. Excluded from the foregoing: Ships over 20 years old, unless reconstructed and rearmed within five years; torpedo craft over 15 years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries.

Of the ten dreadnoughts built, two were completed in 1909, two in 1910, three in 1911, and three in 1912; those completed in 1912 are the *Oldenburg* (launched June 30, 1910), the *Kaiser* (March 22, 1911), and the *Friedrich der Grosse* (June 10, 1911). The 1909 and 1910 dreadnoughts carry twelve 11-inch guns, but the three completed in 1911 and the *Oldenburg* carry twelve 12-inch guns. Each of these eight ships is able to fire only eight of the twelve big guns on either broadside. The *Kaiser* and the *Friedrich der Grosse* carry ten 12-inch guns, but their distribution permits all to fire on either broadside (like the British *Neptune* class). Of the seven dreadnoughts building at the end of 1912, three are sister ships to the *Kaiser* and will be completed in 1913; these three are the *Kaiserin* (launched November 11, 1911), the *Prinzregent Luitpold* (February 17, 1912), and the *König Albert* (April 27, 1912).

The three battle cruisers built are the *Von der Tann*, the *Moltke*, and the *Goeben*; the latter, launched March 28, 1911, and completed in 1912, was reported to have attained a speed on May 20 of 30.5 knots. A fourth battle cruiser, the *Seydlitz*, was launched March 30, 1912, and will probably be completed in 1913.

Reported officers and men in 1912, 68,122, including two admirals of the fleet, four admirals,

13 vice-admirals, 21 rear-admirals and 335 captains and commanders. See NAVAL PROGRESS and BATTLESHIPS.

GOVERNMENT. The executive authority is vested in the king of Prussia under the title of German emperor. In 1912 the emperor was William II., who was born January 27, 1859, and succeeded to the throne June 15, 1888. Heir-apparent, Prince Frederick William, born May 6, 1882. The imperial ministers act under the general supervision of the imperial chancellor, who is appointed by the emperor without reference to the political majority of the legislative body and is directly responsible to him. The legislature consists of the Bundesrath (58 members chosen by the governments of the several states) and the Reichstag (397 members elected for five years by popular vote). Imperial chancellor (and Prussian premier) in 1912, Theobald von Bethmann-Hollweg (from July, 1909). The imperial ministers, or secretaries of state, were: Alfred von Kiderlin-Waechter (died December 30, 1912); interior, Klemens Delbrück; navy, Grand Admiral Alfred von Tirpitz; justice, Hermann Lisso; treasury, Dr. Kühn; posts and telegraphs, Reinhold Kraetke; colonies, Wilhelm Solf.

HISTORY

NATIONALIZATION. On February 8, the federal council adopted a new nationalization bill, whose chief purpose was to render the loss of German nationality more difficult and its recovery easier. Under existing law a German subject lost his nationality after ten years' residence abroad unless his name was placed on the consular registers. The new law provided that German nationality should not be lost unless the German subject becomes naturalized in a foreign country or fails in his military obligations in Germany. A national defense league (*Wehrverein*) similar in purpose to the navy league and devoted to the development of the army was established in Berlin, on January 28, under the leadership of General Keim.

THE ELECTIONS. The attitude of the government was distinctly set forth on the eve of the elections. It declared that the tasks before the new Reichstag were to continue the social policy of the government and to maintain the army and navy in a state of the highest efficiency. The Social Democratic party having proved itself an obstacle to these ends was a peril to the country and ought to be defeated. On the other hand, the Social Democrats were regarded as the party of peace and their triumph was hoped for by many as a check on any aggressive tendency and as an aid to a better understanding between Germany and the other foreign powers. Nevertheless, the Socialists were influenced by the rising tide of nationalism and there was no sign of the bitter and unconditional hostility toward armaments that had formerly been noticeable. The Social Democracy of late years has been more and more inclined to compromise under the influence of the movement known as Revisionism, and there was a tendency for the National Liberals, the Socialists, the South German Populists, and the Prussian Radicals to draw together in a great coalition against the "Blue-Black" government, with the general object of securing a wider democracy. The Blue-Black bloc, which had ruled parliament for

three years, was criticised for its policy of protectionism and reaction and for exploiting the country in the interests of the Agrarians and Conservatives at the expense of the small manufacturers, merchants, tradesmen, and working people. The constant increase in the cost of living was attributed largely to the prohibitive duties on agricultural imports. The Moroccan crisis of 1911 made a deep impression on the mind of the electors. On the one hand, the government was condemned for having brought the nation to the verge of war without its knowledge. In many quarters this heightened the force of the demand for giving the representatives of the people a voice in foreign affairs. On the other hand, the Moroccan affair was attributed less to the fault of the government than to the unwarrantable interference of Great Britain. Anglophobia prevailed among the middle classes, while among the Prussian Conservatives, and the Right Wing of the National Liberals and the Pan-Germans there was constant talk of the "dog-in-the-manger" attitude of Great Britain. Observers declared that at no time in recent years, not even during the Boer War, was there such violent hatred of England in Germany. In general, it was not expected that the elections would result in any change in the policy of armaments, but it was thought that they might, in the long run, effect some constitutional improvement tending to restraint of the government and its Conservative supporters in its foreign policy. The movement for the curtailment of *Junker* leadership in imperial affairs and for increased parliamentary control over them was especially strong throughout the southern German states, where the Liberals and Radicals both worked toward this end. As to the Catholic Centre, it was weakened somewhat in popular support by the resentment of the Protestants against the recent course of the Vatican, notably in the "Borromæus Encyclical," the anti-modernist oath imposed on priests and professors, and the decree of October, 1911, *Motu Proprio*, which denied civil jurisdiction over ecclesiastics.

The elections were held on January 12. Second ballots were taken on January 19, 20 and 25. Complete returns, according to the revised figures, were as follows (the figures in parentheses indicating the losses or gains of the respective parties, compared with the old Reichstag): Centre 90 (loss 13); Conservatives, 45 (loss 13); Free Conservatives, 13 (loss 12); Socialists, 110 (gain 57); National Liberals, 44 (loss 7); Radicals, 41 (loss 8); Poles, 18 (loss 2); Anti-Semites, 11 (loss 10). The remaining 25 seats were divided among other small party groups. The enormous gain for the Socialists greatly exceeded expectations, the most sanguine prophecies looking only to 100 or 105 seats. Throughout the empire they received 4,238,000 votes, an increase of more than a million over the last elections. They thus became the most important party in the Reichstag. The Centre received 2,012,900, a loss of 166,753; the National Liberals 1,871,297, a gain of 34,249; the Radicals 1,556,549, a gain of 322,614; the Conservatives (combined) 1,515,003. The Blue-Black *bloc* composed of the Centre and Conservatives could no longer be relied upon by the government as a sufficient support. It was thenceforth necessary to reinforce it from the groups of the Left, as for example,

the Radicals or National Liberals. The election showed a tendency to align parties more distinctly according to the issues of reaction and progress. On the one hand were the forces representing modern democratic advance, and on the other, the conservative element, supported by the powerful bureaucratic agrarian and financial interests. One side was composed of the Socialists, Radicals, and National Liberals; the other of the different Conservative bodies, the Roman Catholic Centre, and the Poles, and other small groups that usually support the Centre. It was evident that henceforth the *bloc* must be supplemented by recruits from the Right Wing of the National Liberals. The blow at the Centre was especially severe, for they not only lost in numbers, but suffered serious diminution of prestige from their defeat in Cologne.

SIGNIFICANCE OF THE ELECTIONS. The chief result of the elections was a change in the balance of power in the Reichstag, preparing the way for a *bloc* of the parties of the Left, though a weak one. For several years public men of progressive tendencies in Germany have believed that the only way of withstanding the reactionary parties was by an alliance of Liberals and Socialists. But all attempts to bring this about were thwarted by party jealousies. The late Dr. Theodor Barth, editor of *The Nation*, toiled incessantly and with great ability to unite the parties of the Left, but his efforts were not successful. During the last two years, however, political events tended to force the parties of the Left together in self-defense. The coalition of the Centre and Conservatives caused a rejection of the succession duties, and the fall of von Bülow. The Liberals and Socialists were agreed in theory on the question of the succession duties, and both sections of the Liberals, namely, the Liberal Democrats and the National Liberals, finding the government coalition against them, naturally were inclined to a Socialist alliance. The Liberals and Socialists were also in accord on the questions of Prussian electoral reform, customs reform, necessary changes in the constitution, and, in general, as to measures of a progressive tendency. A Socialist Liberal alliance, moreover, was shown to be practicable in the case of the Grand Duchy of Baden, where for several years the two parties had acted together with success. At the 1912 elections, therefore, the Liberals and Socialists went to the polls with strong determination to defeat the Blue-Black *bloc*. At the first ballot they did not join upon common candidates, but left the way open to an alliance later. At the second ballot they joined forces under the rallying cry "A solid front against the Right," and for the first time proved by their success that solidification of the parties of the Left was possible. This demonstration of the power of the progressive element in German politics made a strong impression upon political observers.

BAVARIAN ELECTIONS. The elections of February 5 for the Landtag were another indication of the growing strength of the parties of the Left. In the preceding Landtag the Clericals of Centre had an overwhelming majority of 98 votes out of 163. This vote was supplemented by the 16 votes of the Conservatives and Agrarians. The Liberals and Socialists formed a direct electoral alliance, and, as in the elections for the Reichstag, bent all their energies

to overthrowing the parties of the Right. Their efforts were so far successful as to cut down materially the reactionary majority. The figures were as follows: Centre, 86 (formerly 98); Conservatives and Agrarians, 4 (formerly 16); Liberals, 37 (formerly 26); Socialists, 30 (formerly 22); Agrarian League, 6 (formerly 3). On the eve of the elections the ministry resigned, but the prince regent deferred his acceptance of the resignation. Since it was known that the elections had so seriously cut down the Clerical majority, the prince regent summoned Baron von Hertling to form a new cabinet. In this ministry none of the members of the former ministry held office. This change attracted much attention as indicating for the first time a recognition on the part of the German government of a parliamentary régime. Hitherto in Bavaria, as well as in other German states, the ministers were regarded as owners of state like any others, and quite independent of the wishes of the majority in parliament. The change in the cabinet after the elections was regarded by many as breaking the tradition in that it substituted for the former ministry, which was the old-fashioned ministry of functionaries, a new ministry under the leader of the parliamentary majority.

PARLIAMENT. The new Reichstag was opened on February 7. In a speech from the throne the chancellor declared it to be the aim of his policy to maintain the order of the empire and state unhampered, improve the general welfare and increase and strengthen the prestige of the nation. He referred to the important measures adopted for a whole generation to meet the needs of social improvement, and said that the same social spirit must continue to control legislation. He declared that the finances of the empire had reached a more stable footing. Bills for the maintenance and the strengthening of the military and land forces would be presented. He pointed to the recent agreement with France as a fresh proof of the readiness of Germany to settle international disputes amicably. The Reichstag was adjourned on May 22 to meet at the end of November. Its chief work during the first session was the voting of the defense bills. (See paragraph *Defense Bills*.) There was no opposition to them on principle save on the part of the Social Democrats, but the majority was divided on the question of providing the financial means. The increases called for an expenditure of 150,000,000 marks annually on the average for a period of five years. Herr Wermuth, secretary for the treasury, demanded that new revenues be provided to meet these new expenditures. On this question the alignment of parties was precisely what it had been in June, 1909, when the rejection of the succession tax had overthrown the von Bülow government. The Liberals opposed any tax that would fall upon the mass of the population, such as taxes on consumption or on the means of transportation, and demanded taxes on acquired wealth and especially on successions. The Conservatives, supported by the Centre, opposed a succession tax in any form. The majority, comprising Socialists, Liberals, and National Liberals, were solidly in favor of a succession tax as the only solution of the problem. The Centre, however, proposed a means of evading the difficulty. They argued that it was not necessary to create new sources of revenue except

for a trifling fraction of the expenditures, since under the able administration of the finance minister, Herr Wermuth, the budget excess for this year would be sufficient. This view finally prevailed, despite the vigorous protest of Herr Wermuth, who pointed out that the excess of one or even two years should not be taken as proof that the following years would show the same favorable balance. Upon the adoption of this policy, Herr Wermuth resigned and was succeeded by Herr Kuehn, the under secretary. Specifically, the plan proposed to meet the new military and naval expenditures provisionally out of the current budget surplus and to cover any deficit by abolishing the rebate duty on spirits. This arrangement was not acceptable to the Liberals and a compromise was reached just before the close of the session, whereby it was provided that a law imposing a general tax on acquired wealth, "which shall take account of the different forms of such wealth," should be presented to the Reichstag before April 30, 1913, and that six months after it went into effect the reduction of the consumption duty on sugars contemplated by the law of July 15, 1909, was to become operative. It was added, however, that this reduction was to go into effect "at the latest on October 1, 1916." The lowering of the sugar duty, which was a tax on consumption, was desired by the Liberals, who of course also favored a tax on acquired wealth, but the wording of the resolution left the way open to long delays. In effect it guaranteed nothing, and made it possible to defer the reduction of the sugar duty till October 1, 1916. The Liberals introduced a resolution demanding that the project for a succession tax established in 1909 should go into effect on January 1, 1913. This the government accepted, but declared that it would give the previous proposal the precedence. The army and navy bills and the spirits bill were finally passed. Such was the situation at the close of the session. It was expected that the fiscal problem, which for three years had been the chief subject before the Reichstag, would form the main business of the autumn session. Toward the end of the spring session the Kaiser's Strassburg speech, in which he was reported to have threatened to revoke the new constitution of Alsace-Lorraine if matters did not mend (see below paragraph *Alsace-Lorraine*), revived the old question of imperial encroachments and a "personal régime" and threatened to bring back the stormy scenes of November, 1908. Times had changed, however. Chancellor von Bülow wished to govern as a constitutional chancellor. Now the Reichstag had to deal with a chancellor who was long accustomed to the "personal régime" and who stood by the kaiser through thick and thin. There was, however, some energetic language on the subject, but the discussion was brief and availed nothing. Nevertheless the new Reichstag made some progress along the lines indicated by the government's critics in November, 1908. It increased its strength and fortified itself to some extent against imperial aggression by changes in the rules. It modified its organization in two important points: In the first place it assumed the right to address "petty questions" to the government, as in the British parliament; and in the second place it assumed the right to follow its interpellations with motions declaring that the sense of the

assembly was or was not in accord with the government. It made use of the first of these new powers in the session, but not of the second. An anti-duelling resolution was adopted by the Reichstag, in which there was much criticism of the war ministry for its dismissal of a Catholic officer of the army who had refused to fight a duel to "maintain his honor." Catholics and Socialists were especially emphatic in their condemnation. The war minister, while deprecating the practice of duelling, declared it to be inevitable.

ALSACE-LORRAINE. On May 7 the Alsace-Lorraine Diet passed a vote of censure on the government's decision to suspend its orders at the factory of Grafenstadt on account of the director's alleged hostility to the empire. A week later the emperor in an address at Strassburg declared that if affairs did not improve in Alsace-Lorraine he would disregard the constitution and annex the country to Prussia. This led to Socialist attacks in the Reichstag and interpellations. The chancellor defended the emperor's course. The new constitution established in the autumn of 1911 had been welcomed by the people. The Democratic character of the first chamber of the new Alsace-Lorraine legislature, however, offended the reactionaries in the empire, who declared that the constitution had brought about an intolerable situation. The attitude of the chamber in this Grafenstadt affair and its previous action in suppressing the funds placed at the emperor's disposal (though it subsequently restored them) aggravated their hostility. They therefore supported the kaiser when he showed especial favor at Strassburg to the public official, Under Secretary of State Mandel, in whom the Alsace-Lorraine chamber had voted lack of confidence on account of the Grafenstadt affair; and they approved his alleged threat as to making the Reichsland a Prussian province.

FOREIGN POLICY. The meeting of czar and kaiser at Port Baltic on July 4 led, as usual, to much discussion in the press. The official *communiqué* which followed the interview contained a passage which tended to reassure those who lived in constant alarm over the aggressive designs of Germany. It declared: "There could be no question either of non-agreements, because there was no particular occasion for them, or of producing alterations of any kind in the grouping of the European powers, the value of which for the maintenance of equilibrium and of peace has already been proved." It was taken as significant that Germany should thus reaffirm the principle of the balance of power. It tended to strengthen confidence in her policy. See FRANCE, *History*, and TURKEY AND THE BALKAN PEOPLES.

THE QUESTION OF THE JESUITS. One of the first acts of the new Clerical ministry in Bavaria under Baron von Hertling was to issue a decree relieving the Jesuits from the restrictions imposed upon them by that portion of the law of 1872 which was still unrepealed, and forbade their performing any spiritual function. The government had declared that this did not prohibit their celebrating low mass, holding public meetings, etc. This law against the Jesuits was declared by Baron von Hertling to be an "odious law of exceptions" and he urged that it be repealed as soon as possible. The indignation of the Protestants was strongly aroused. The imperial chancellor, von

Bethmann-Hollweg, tried to quiet public clamor by declaring himself in a general way opposed to the Bavarian minister's construction of the law, but at the same time he conferred with the latter and they finally decided to carry the question to the Federal Council, which was to pronounce authoritatively on the meaning of the law. The Bavarian bishops in an address to the council made an energetic demand for the repeal of the law. Catholic sentiment was deeply aroused and the Catholic Congress at Aix-la-Chapelle in August made this issue the leading feature of their programme. The matter was pending before the Federal Council in the summer, but it was slow to take action on account of the political difficulties involved—the risk of offending Protestant sentiment on the one hand and of alienating the government's Clerical supporters on the other. The Catholics complained that while the Jesuits, the loyal servants of the church, were oppressed and muzzled by laws of exceptions, the Socialists, foes of both church and state, were left free to propagate their subversive doctrines as they chose. Liberals and Socialists were on principle opposed to any law of exceptions, but the rivalry of parties, and especially the hostility between Socialists and Clericals, made their action in this matter problematical.

On November 26 the decision of the council, though gently worded, was in spirit essentially adverse to the position taken by Baron von Hertling. There was much indignant comment on it in the Clerical press, and in the Reichstag at the beginning of December the Clerical Centre openly attacked the government and declared a complete lack of confidence in the ministry of von Bethmann-Hollweg. Some saw in this a presage of the dissolution of the Blue-Black bloc, but others were not disposed to regard it seriously.

DEFENSE BILLS. On May 21 the Reichstag passed the army bill and the navy law amendment bill. As to the financial arrangements, they postponed the reduction of sugar duties. The Reichstag committee decided on the re-introduction of the death duty proposals next year. The increases of the German military and naval effectives came up for discussion in April. The policy was regarded with alarm in England and France. The augmentation was said to be greater than at any time since the Franco-German War. In 1911 the law of the quinquennium provided for an increase of 11,000 men and it was supposed that this would suffice for another five years, but within a year from its passage came this far greater increase, adding 29,000 more men, not counting the under officers. This was attributed by the Germans themselves to the incident of Agadir, which had revealed the fact that France was not sufficiently afraid of war. According to German public opinion, the empire had not derived from the Moroccan affair the advantages to which it was entitled. The military strength of Germany in future must be sufficient to prevent any such failure. The new measure provided for the formation of two new army corps to protect the Franco-Prussian frontier. The naval bill amended the existing naval programme by providing for three additional battleships and two additional cruisers, to be ready by 1920. It also provided for an increase of the personnel by 1600 men and for the more immediate effectiveness of the fleet.

The increased expenditure on defense was to be met out of the budget surplus and by reducing the percentage of the brandy excise to be allotted to the states.

NAVY LEAGUE. Early in April the German Navy League published its annual report. This showed a total membership at the end of 1911 of 1,054,404, and an increase in the league's funds. The twelfth annual meeting of the league was held on June 9 at Weimar. The new programme for agitating on behalf of the naval defense was adopted with enthusiasm. Grand-Admiral von Köster in his address demanded more large cruisers and a great increase of personnel. He said that they would not be going too fast if by 1917 five additional cruisers were built and 5000 men were added to the personnel. He criticised the present provisions of the navy law.

ESPIONAGE TRIALS. The trials in recent years of German subjects in Great Britain for espionage, and of British subjects in Germany, have attracted much notice in the press and have tended to increase the national jealousies. An important trial of this nature began on January 31, when Mr. Bertrand Stewart, who had been arrested in Bremen on August 2, was brought to trial before the Imperial Supreme Court at Leipzig. The charge was that during the year 1911 he had endeavored to obtain knowledge of military secrets. After a four-days' session the court found Mr. Stewart guilty and sentenced him to detention in a fortress for three years and six months, which period, however, was reduced by four months on account of the long imprisonment. There were extenuating circumstances in the case and the sentence was regarded in Great Britain as too severe. It was pointed out that much lighter sentences had been imposed by British courts when German offenders of the same class were brought before them. It was, however, realized in Great Britain that the system of jurisprudence under which the case was tried was altogether alien to the English, especially in the importance attached by the German judge to the unsupported testimony of informers.

OTHER EVENTS. On January 24 Prussia celebrated the two-hundredth anniversary of the birth of Frederick the Great. In March the kaiser visited Vienna and Venice on his way to Corfu. In July occurred his interview with the czar (see *RUSSIA, History*), and in September he visited Switzerland. As to labor conditions, see **STRIKES** and the various articles on **LABOR**.

HIGH COST OF FOOD. In Germany, as in other countries, there was much concern over the increased price of food products, and in some places there was popular agitation of the subject. The Federal Council in February suspended the import duties on potatoes till May 1. The Socialists conducted a vigorous campaign for lower prices. In the autumn there was bitter complaint of the high price of meat and in September many of the town councils demanded that the frontiers be opened to the importation of cattle and that the duties on cattle feed be abolished. The government took the stand that it was a general economic phenomenon throughout the world and refused to modify the tax system. In Prussia, however, some slight concessions were made. (See below, paragraph on *Prussia*.)

THE OIL MONOPOLY. Toward the end of the

year the government introduced its project for a monopoly of the petroleum industries in Germany, urging as an argument the need of new sources of revenue from which to provide for the relief of veterans of the wars of 1864, 1866, and 1870. This did not look to a state monopoly, properly speaking, but to a monopolistic organization, with the collaboration of several of the large banks, which should operate under state supervision. It was designed not only as a source of revenue but as a competitor of the American Standard Oil Company, which virtually controlled the German market. It encountered considerable opposition in the Reichstag, but was finally referred to a commission. The matter was still unsettled at the close of the year.

PRUSSIA. The Prussian Diet was opened on January 15, but adjourned until after the elections. Herr von Bethmann-Hollweg in a speech from the throne again abstained from any reference to the Prussian franchise. The government programme, as announced by him, included, besides the measures of financial reform, a proposed plan for new legislation dealing with water works, fisheries, internal colonization, compulsory attendance at continuation schools in rural districts, etc. Motions for the reform of the Prussian electoral system were rejected by the Diet May 23. In order to destroy the influence of the six Socialist deputies who, despite the three-class electoral system, had succeeded in securing seats, the Landtag adopted a very rigorous rule, whereby the president could exclude deputies and have them removed by the police. This was applied in the case of Socialist Deputy Borchardt, who was twice dragged out by the police, although he showed the officer the article in the penal code punishing with hard labor anyone preventing a deputy from performing his parliamentary duties. The president made a criminal charge against him and his companion, Leinert, who was also thrown out, and the majority in the Landtag voted the suspension of parliamentary immunity. This course on the part of the reactionary majority was interpreted by their opponents as a desperate defense against the encroachments of the populace whom these Socialists represented and who would endeavor to force their way into parliament in spite of the obstacles interposed by the present electoral system. The reactionaries were determined to oppose the slightest modification of that system.

In October, in consequence of the agitation over the high price of meat, the Prussian government decided to modify some of the meat regulations, though it did not accede to the demand that the provisions excluding frozen meat be repealed.

For notes on Germany on subjects not dealt with here, see *KIDERLEN-WÄCHTER, ALFRED VON; ARCHITECTURE; GREAT BRITAIN, History*.

GIBRALTAR. A narrow peninsula extending southward from the southwest coast of Spain; a British crown colony, naval and coaling station, and *entrepôt* of the British trade with the Arabian states of north Africa. Area, 17½ sq. miles; population, exclusive of the military, 19,120. Practically a free port, it gives no trade returns. Revenue (1910). £80,929; expenditure, £76,410; total tonnage entered and cleared, 10,940,218 (6,562,085 Brit-

ish). Gen. Sir Archibald Hunter was governor and commander-in-chief in 1912.

GIFTS AND BEQUESTS. The following list of gifts and bequests in 1912 is compiled from the record kept by the *Chicago Daily Tribune*. The total amount given in gifts and bequests during the year amounted to the immense total of \$241,821,719, as compared with \$126,490,918 in 1911. It must be taken into consideration that the total for 1912 includes only published donations. It is probable that the entire amount given, if it were known, would be twice the sum. Of the total amount, \$177,923,076 represents gifts and \$63,898,643 represents bequests. The total amount given may be classified as follows: To charities of various kinds, \$184,747,555; educational institutions, \$35,207,907; religious bodies, \$10,847,756; art museums, galleries, and municipal improvements, \$8,906,501; and libraries, \$2,112,000. The sum contributed by women amounted to \$17,787,287 of which \$12,252,037 was by bequests and \$5,535,250 by gifts.

Andrew Carnegie again contributed the largest individual sum, a total of \$130,403,000. Of this, \$125,000,000 was distributed through the Carnegie Corporation of New York. Mr. Carnegie gave to the Carnegie Technical Schools of Pittsburgh \$2,000,000 and to the Teachers' Foundation Fund \$2,000,000. His other gifts were to libraries, colleges, and for miscellaneous purposes. He proposed a pension of \$25,000 for former presidents of the United States, but it did not meet with favor.

John D. Rockefeller made no unusually large gifts during the year. The total amount distributed by him was \$227,000, chiefly for colleges and hospitals. Mrs. Russell Sage made gifts totaling \$428,500. Included in this was \$150,000 with which was purchased Marsh Island, Louisiana, which is to form a refuge for migratory birds. (See ORNITHOLOGY.) The sums given by J. Pierpont Morgan aggregated \$591,700. The largest gift made by Mr. Morgan was one of \$200,000 to Trinity College. His other gifts were made to hospitals, colleges, and various relief funds. Julius Rosenwald of Chicago gave to charities, to institutions, and to schools, \$760,000. Miss Helen Gould gave to the New York Y. M. C. A. and Y. W. C. A. \$271,000.

Academy of Arts and Sciences, will by Francis Amory, \$25,000.

Adam, J. N., Buffalo, N. Y., will to charity, \$100,000.

Adams, Ivers W., Ashburnham, Mass., gift to town, \$25,000.

Agassiz, G. B., Boston, Mass., gift to Harvard University, \$25,000.

 Zurbrugg, Mount Holly, N. J., will to charity, \$250,000.

GILMAN, NICHOLAS PAINE. An American sociologist, economist, and educator, died January, 1912. He was born in 1849 and received an academic education. He graduated from the Harvard Divinity School in 1871 and settled as a Unitarian clergyman over three parishes in Massachusetts in 1872. He remained here until 1884. From 1888 to 1895 he was editor of the *Literary World* and from 1895 to the time of his death was professor of sociology and ethics at Meadville Theological School. He was editor of *The New World* from 1892 to 1900. He was the author of *Profit-sharing Between the Employer and Employee* (1889); *Laws of Daily Conduct* (1891); *Socialism and the American Spirit* (1893); *A Dividend to Labor* (1899), and *Methods of Industrial Peace* (1904).

GOLD. The production of gold in the United States from domestic ores in 1911 was 4,687,503 fine ounces, valued at \$96,890,000, as compared with 4,657,018 fine ounces, valued at \$96,269,100, in 1910, showing a very slight increase in the production in 1911. Of the States producing gold, California produced in 1911 the largest quantity, 964,041 fine ounces, valued at \$19,928,500. Colorado produced 925,839 fine ounces, valued at \$19,138,800; Montana, 875,438 fine ounces, valued at \$18,096,900. The gold production of other States will be found in the paragraph *Mineral Production* under these States. In addition to the production of gold and silver from domestic smelters in 1911, the smelters and refiners produced as refined bullion from foreign ore, matte, and unrefined bullion 875,156 fine ounces.

The gold production in 1912 in the United States, as will be seen in the following table, was considerably less than that of 1911. The figures are from the *Report of the Director of the Mint*. It will be noted that California and Colorado both had decreased production in

1912 while the decrease of Nevada was nearly \$5,000,000:

	1911	1912
Alabama	\$ 18,335	\$ 17,674
Alaska	16,002,976	17,398,943
Arizona	2,954,790	3,303,504
California	20,310,987	19,988,486
Colorado	19,153,860	18,791,710
Georgia	30,532	9,881
Idaho	1,169,261	1,303,917
Missouri	310
Montana	3,169,840	3,235,287
Nevada	18,968,578	13,331,680

Total	\$96,890,000	\$91,685,134

The production of gold in the world in 1912, according to the figures gathered by the *Engineering and Mining Journal*, exceeded that of any previous year, the increase over 1911 having been \$10,240,783 or 2.2 per cent. This increase is due almost entirely to the large gain in the Transvaal, which was approximately \$18,225,000. The gain made in the African mines was sufficient to offset the losses in the United States, Russia, and Mexico. The Australasian mines also continued to decrease in production, and this has now extended through several years. The gold production in 1911-12, as recorded by the *Engineering and Mining Journal*, will be found in the following table:

	1911	1912
Transvaal	\$170,059,273	\$188,285,000
Rhodesia	12,986,000	13,375,000
West Africa	5,197,488	7,379,000
Madagascar, etc.....	2,706,639	2,750,000
Total Africa.....	\$190,949,400	\$211,789,000
United States	\$ 96,890,000	\$ 91,685,168
Mexico	24,880,100	22,500,000
Canada	9,762,100	11,250,000
Central America, etc..	3,399,000	3,450,000
Total North America.	\$134,931,200	\$128,885,168

For metallurgy of gold, see METALLURGY.

GOLD COAST, THE. A British crown colony, with Ashanti and the protected Northern territories situated on the Gulf of Guinea. Area of the colony, 24,200 square miles; of

Ashanti, 20,000; of the Northern Territories, 35,800—total, 80,000. The census (1911) returns place the population at 1,502,899 (colony, 857,516; Ashanti, 287,814; Northern Territories, 357,569); but the figures are believed to understate the actual number of inhabitants. Accra, the capital, had (1911) 19,585 inhabitants; Coomassie, 18,853; Cape Coast Castle, 11,364; Secondee, 7725. The chief products and exports (1910), are cacao, £866,571; gold and gold dust, £700,282; rubber, £358,876; palm kernels, £185,058; palm oil, £161,388; lumber, £148,078; kola nuts, £77,716. Cotton goods, provisions, and wine and spirits are the main imports. Total trade (1910): £3,365,841 imports, £2,697,105 exports. Revenue, £1,006,633; expenditure, £924,862. Tonnage entered and cleared, 2,599,388. A railway runs from Secondee to Coomassie. During 1912 a railway under construction from Accra to Akwapim was opened for traffic to a temporary terminus at Pakro, about 37 miles distant. Total telegraph lines, 1424 miles. James Jameson Thorburn was governor in 1912 (Lt.-Major Herbert Bryan, acting).

GOLF. Harold H. Hilton of the Royal Liverpool Gold Club, who in 1911 came to the United States and won the National Amateur Golf Championship, not only failed to retain his title in 1912, but was put out of the running in the first round of the tournament at Wheaton, Ill., by Charles G. Waldo, Jr., of Brooklawn. Jerome D. Travers of Upper Montclair captured the amateur title for the third time in his career by defeating Charles W. Evans, Jr., of Edgewater, 7 up and 6 to play in the 36-hole final round. In the gold medal contest Hilton and Evans battled to a tie, Evans winning in the play off. Travers added to his laurels by winning the metropolitan amateur tournament held at Baltusrol. The metropolitan open tournament was won by Tom McNamara, and the national open was won by John J. McDermont for the second successive year. McNamara is the first American-born player to win the metropolitan open.

Miss Margaret Curtis won the women's national championship for the third time since 1907 by defeating Mrs. Ronald H. Barlow in the final round by 3 up and 2 to play. Mrs. Barlow, however, had little trouble in winning the championship of the Women's Eastern Golf Association. The English open championship was won by Edward Ray, with Harry Vardon as runner up. John Ball captured the English amateur championship and Miss Gladys Ravenscroft the British ladies' championship. The French open championship went to Jean Gassiat, Harry Vardon finishing second. J. H. Taylor won the German open championship, Edward Ray, the English champion, taking second place.

The team championship of the Intercollegiate Golf Association for the fifth year in succession was won by Yale, which defeated Harvard in the finals by 6 matches to 3. The individual winner was F. C. Davidson of Harvard, who was the victor over J. M. Sterns of Princeton, 1 up in 37 holes. In dual college matches Yale defeated Princeton and Princeton defeated Cornell. The Oxford and Cambridge contest resulted in a tie, each university winning 4 matches, **GOMEZ, J. M.** See CUBA.

GOMPERZ, THEODORE. An Austrian philosopher and classical scholar, died August,

1912. He was born at Brunn in 1832 and studied at the University of Vienna, where from 1869 to 1901 he was professor of classical philology. In the latter year he entered the House of Peers. Of his many published works the most notable are: *Demosthenes der Staatsmann* (1864); *Herculanische Studien* (1865-6), and his great history of Greek philosophy, *Griechische Denker* (1893-1895). He edited the German edition of the works of John Stuart Mill (1869-1880).

GOODWIN, WILLIAM WATSON. American scholar and educator, died June 16, 1912. He was born in Concord, Mass., in 1831, and graduated from Harvard University in 1851. Until 1855 he studied in Germany at the universities of Göttingen, Berlin, and Bonn. From 1856 to 1860 he was a tutor in Harvard University. In the latter year he was appointed professor of Greek literature, serving until 1901, when he was appointed professor emeritus. He was the first director of the American School of Classical Studies at Athens, 1882-3. From 1903 to 1909 he was overseer of Harvard University. In 1903 he was president of the American Academy of Arts and Sciences. He was a member of many American and foreign learned societies. He was a Knight of the Greek Order of the Redeemer. Among his published writings are: *Syntax of the Moods and Tenses of the Greek Verb*, and a *Greek Grammar*. He edited *Demosthenes on the Crown and Against Midias*.

GORDON, JAMES. A former United States senator from Mississippi, died November 28, 1912. He was born in Monroe County, Miss., in 1855. He served in the Confederate army during the Civil War as captain of the Jeff. Davis Legion, and as colonel of the 4th Mississippi Cavalry. After the close of the war he engaged in cotton planting, in which he was successful. On December 27, 1909, he was appointed United States senator to succeed Anselm J. McLaurin. He served until February 22, 1910. Colonel Gordon made no pretense of mastering the details in the Senate and very seldom took part in its discussions. He was, however, on account of his age and his gentle and generous attitude towards certain senators who made bitter attacks on the Confederate cause, a distinguished figure in the Senate. Shortly before his retirement he delivered one of the most affecting pleas for charity and consideration on the part of the North and the South ever heard in the Senate chamber. His speech was greeted with unprecedented applause from the senators. One of the last acts of Colonel Gordon was to write a letter defending the memory of the late Senator Heyburn, whose attitude against the Confederate cause was bitter and uncompromising. Colonel Gordon pleaded that these things should be forgotten and that the better qualities of Senator Heyburn only should be remembered. Colonel Gordon had considerable literary ability and was the author of *The Old Plantation, and Other Poems*. For many years he contributed to magazines, especially to publications dealing with hunting and other sports.

GORDON, WILLIAM W. An American soldier and merchant, died September 11, 1912. He was born at Savannah, Ga., in 1834. He graduated from Yale College in 1854 and served in the Confederate army, first as second lieu-

tenant in Stewart's cavalry and later as captain in the Confederate cavalry. He was wounded at Lovejoy's Station, Ga., and was placed upon the roll of honor for gallantry at Frederick City, Md. After the war he served in the Georgia cavalry and was four times in command of troops for riot duty. He engaged in the cotton business in Savannah and became senior partner of the firm of W. W. Gordon & Co. At the outbreak of the Spanish-American War he was appointed brigadier-general of volunteers and was a member of the Porto Rican Evacuation Commission.

GOVERNORS' CONFERENCE. The fifth annual meeting of the governors of the States, the so-called "House of Governors," was held in Richmond, Va., in the first week in December. Many subjects of national as well as of State interest were discussed. One of the most important of these was agricultural credits, and a committee was appointed to draft a system of laws to be recommended to the State legislatures. A State income tax law and uniform divorce legislation were also discussed.

The useful work of the conference was unfortunately subordinated in the public mind by the notoriety gained through several inflammatory speeches practically defending and upholding lynching, delivered by Governor Blease of South Carolina. Governor Blease was sharply answered by several of the governors. For a more detailed account of this unpleasant episode, see SOUTH CAROLINA. The conference formed a permanent organization and elected Miles C. Riley, of the Wisconsin Legislative Reference Library, secretary. The next meeting will be held in Colorado Springs in 1913.

GRADUATE SCHOOL OF AGRICULTURE. See AGRICULTURAL EDUCATION.

GRADY, THOMAS FRANCIS. An American lawyer and politician, died February 3, 1912. He was born in New York City in 1853 and was educated in the parochial schools of that city and in Manhattan College. For a short time after graduation he worked in a publishing house in New York City, but soon took up the study of law and was for a time employed in the office of the corporation counsel. He became known as a speaker by delivering temperance lectures in New York City. He became interested in politics and was appointed recording clerk in the county clerk's office in 1874. A few years later he was elected to the State Assembly and was reelected until 1881, when he was made State senator. He had become affiliated with Tammany Hall and was regarded as one of the most efficient politicians connected with that body. In 1883, when Grover Cleveland was governor of the State, Mr. Grady opposed many of the measures which the former wished passed by the legislature. He also assailed Cleveland in speeches and succeeded in holding up many nominations which the governor had sent to the Senate. Cleveland thereupon sent a letter to John Kelly, leader of Tammany Hall, in which he said that he did not wish Mr. Grady to be returned to the Senate, and he was, as a consequence, retired from that body. In the presidential campaign of 1884 he advocated the election of Benjamin F. Butler and made speeches in his favor throughout the United

States. In 1888, however, he advocated the reelection of President Cleveland and in the following year was returned to the New York State Senate. For ten years he was the Democratic minority leader in the Senate, but when the Democrats obtained a majority in that body as a result of the election of 1910 he was refused the position of leader of the majority. Mr. Grady was regarded as the foremost orator connected with Tammany Hall and he became the spokesman for Richard Croker in national and State conventions. He opposed most of the reform measures advocated in the legislature during his term of service in that body.

GRAFTON, CHARLES CHAPMAN. An American bishop of the Protestant Episcopal Church, died August 30, 1912. He was born in 1830 and graduated from Harvard College in 1853. In 1858 he was ordained priest. He served as rector in churches in Baltimore and Boston until 1889, when he was consecrated Bishop of Fond du Lac. He organized in England, in 1865, with the Rev. R. M. Benson, the Society of St. John the Evangelist, a religious brotherhood, otherwise known as the "Cowley Fathers." He also established the St. Margaret's Sisterhood in Boston. He was the oldest Protestant Episcopal bishop at the time of his death. He was the author of *Vocation, or Call of the Divine Master to a Sister's Life*; *Plain Suggestions for a Reverent Celebration of the Holy Communion*; *Fond du Lac Tracts*; *Christian and Catholic* (1905); *Catholic Atlas*, and *Roman Correspondence* (pamphlets).

Bishop Grafton was one of the foremost leaders of the High-Church section of the denomination. In 1906 a religious storm was raised by the accusations of Dr. William Austin Smith, rector of St. Paul's Church in Milwaukee, who attacked Bishop Grafton for his High-Church tendencies. He accused Bishop Grafton of polytheism. The friends of the bishop rallied to his support and an interesting theological discussion followed. He was an earnest advocate of a closer union with the Eastern Church, and with this in view made an extended trip through the East. His observations inspired him to efforts to bring about the formation of the American branch of the Anglican and Eastern Orthodox Churches' Union, whose aim was to foster intercommunion between the two bodies, as well as mutual recognition of each other's Catholic position.

GRAHAM, CHARLES MORICE. A Roman Catholic bishop, died September 1, 1912. He was born in 1834 at Mhow, in the East Indies. He was first educated in England under the care of Protestant relatives, but at the age of ten years was placed in a Roman Catholic school and in 1851 was sent to the English College at Rome. He was appointed to serve in the diocese of Plymouth and became in succession canon and vicar-general. In 1891 he was appointed titular bishop of Cisamos and coadjutor to Bishop Clifford of Clifton. In 1902 he was appointed bishop of Plymouth. He resigned in 1911 and the Pope bestowed upon him the title of archbishop of Tiberias.

GRANT, FREDERICK DENT. An American major-general, son of Ulysses S. Grant, died

April 11, 1912. He was born in St. Louis in 1850. While a boy he accompanied his father in several campaigns of the Civil War. After its close he entered the United States Military Academy, from which he graduated in 1871. In the same year he was appointed second lieutenant of the 4th United States Cavalry. From 1873 to 1881 he acted as aid to General Sheridan, having been promoted from lieutenant-colonel. In this capacity he served on the frontier in campaigns against the Indians. He resigned from the army in 1881. In 1885 he was appointed United States minister to Austria by President Harrison. From 1894 to 1898 he was police commissioner of New York City. At the outbreak of the Spanish-American War he was appointed colonel of the 14th New York Infantry and in the same year was promoted to be brigadier-general of volunteers. He saw service in the Spanish-American War and in the rebellion in the Philippines. In 1901 he was appointed brigadier-general in the United States army and major-general in 1906. He was at various times in command of districts of Southern Luzon, Northern Luzon, Department of Texas, Department of the Lakes, and the Department of the East. He was commander of the latter department at the time of his death.

GREAT BRITAIN. THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND. A constitutional monarchy. Capital, London. Great Britain consists of England, Scotland, and Wales. Attached to the United Kingdom are the Isle of Man and the Channel Islands.

AREA AND POPULATION. The area of the United Kingdom, including inland water, is stated at 121,105 square miles; including the Isle of Man and the Channel Islands, 121,407 square miles. England and Wales comprise 58,340 square miles, or in land area alone 58,029 square miles; Scotland, 30,405 square miles, or in land area 29,796 square miles. By divisions the area, the population according to the censuses of April 1, 1901, and April 3, 1911, and the density per square mile in 1911, are shown in the following table (the figures for Scotland and Ireland being subject to slight revision):

	Sq. m.	Pop. 1901	Pop. 1911	Dens.
England	50,874	30,813,043	34,045,290	669
Wales	7,466	1,714,800	2,025,202	271
Scotland	30,405	4,472,103	4,759,445	156
Ireland	32,360	4,458,775	4,381,951	135
U. Kingdom.	121,105	41,458,721	45,211,888	373
Isle of Man...	227	54,752	52,034	229
Channel Isls...	75	95,618	96,900	1,292
Total	121,407	41,609,091	45,360,822	374

The population figures represent persons present (population present, *de facto*, or *de fait*, as distinguished from population resident, legal, *de jure*, or *de droit*); no census of the population resident is taken in the United Kingdom, and therefore the figures above do not include British soldiers, sailors, and merchant seamen abroad.

Growth of population in Great Britain and decrease in Ireland have been as follows:

	E. & W.	Scot.	Ire.	U. K.
1841	15,914,148	2,620,184	8,175,124	26,709,456
1871	22,712,266	3,360,018	5,412,377	31,484,661
1891	29,002,525	4,025,647	4,704,750	41,468,721
1911	36,070,492	4,759,445	4,381,951	46,211,888

The following table shows the percentage of population in the several divisions and, in the last two columns, the percentage of increase from 1891 to 1901 and from 1901 to 1911:

	1841	1891	1901	1911	'91-'01	'01-'11
England	56.1	72.8	74.3	75.3	12.1	10.5
Wales	3.4	4.0	4.1	4.5	13.3	18.1
Scotland	9.8	10.7	10.8	10.5	11.1	6.4
Ireland	30.7	12.5	10.8	9.7	*5.2	*1.7

* Decrease.

In England and Wales, the increase per cent. by births in the period 1891-1901 was 31.57; decrease by deaths, 19.18; natural increase, 12.39; in the period 1901-11, increase by births, 28.56; decrease by deaths, 16.13; natural increase, 12.43. The actual increase per cent. in these two periods was 12.17 and 10.89, the difference between actual increase and natural increase being accounted for by excess of emigrants over immigrants.

In 1911 the number of males and females were, respectively: England, 16,421,298 and 17,623,992 (or 1073 females to 1000 males); Wales, 1,024,310 and 1,000,892 (977 females to 1000 males); Scotland, 2,307,603 and 2,451,842; Ireland, 2,186,804 and 2,195,147.

In England and Wales, the population of urban districts in 1901 numbered 25,058,355, and of rural districts 7,469,488; in 1911, 28,162,936 and 7,907,556. In 1851 the percentage of population in urban districts in England and Wales was approximately 50.2; in 1881, the actual percentage was 67.9; in 1891, 72.0; in 1901, 77.0; in 1911, 78.1. The report on the 1911 census points out that the increase in the proportion of persons living in urban districts, although mainly due to an actual growth of the population within those areas as existing in the earlier census years, is also partly to be accounted for by the extension of those areas themselves, owing to the absorption of areas which were previously rural. While the general increase per cent. in England and Wales was 10.89 in the period 1901-11, the urban increase was 11.1 and the rural 10.2; in the preceding intercensal period the urban increase was 15.2 per cent., and the rural 2.9 per cent.

At the 1911 census there were in England and Wales 97 urban districts (including the administrative county of London as one district) which had a population exceeding 50,000 each. The inhabitants of these districts in 1891 numbered 13,779,848; in 1901, 15,886,874; in 1911, 17,251,009; the increase per cent. in the first intercensal period being 15.3, and in the second 8.3. London (that is, the administrative county, embracing 74,816 acres, or 117 square miles), had in 1911 4,521,685 inhabitants, as compared with 4,536,267 in 1901, or a decrease of 0.3 per cent. The City of London (comprising 675 acres) decreased in population from 37,702 in 1891 to 26,923 in 1901 and 19,658 in 1911, the decrease per cent. in the two intercensal periods being 28.6 and 27.0. The City is mainly covered by buildings used for business purposes, and the census included those persons only who passed the night of the cen-

sus within the city boundaries. A special census, taken April 25, 1911, showed that within the City 364,061 persons were engaged in business during the day. "Greater London" is a term used to describe the area covered by the Metropolitan and City of London police districts; it contains, besides the administrative county of London, a wide belt of suburban towns and districts, known as the "outer ring." This outer ring had in 1891 1,405,852 inhabitants; in 1901, 2,045,135; in 1911, 2,729,673; the increase per cent. in the two intercensal periods being 45.5 and 33.5. The outer ring in 1911 embraced the following areas: Middlesex administrative county, 148,701 acres, with 1,126,465 inhabitants; in Surrey, 80,099 acres, with 526,366 inhabitants; in Kent, 43,281 acres, with 172,327 inhabitants; in Essex, 60,436 acres, with 849,610 inhabitants; in Hertfordshire, 36,091 acres, with 54,905 inhabitants; total, 368,608 acres, or 576 square miles, with 2,729,673 inhabitants. Greater London (that is, the administrative county plus the outer ring) embraced 443,424 acres, or 693 square miles; with 7,251,358 inhabitants, in 1911, as compared with 6,581,402 in 1901 and 5,633,806 in 1891; the increase from 1891 to 1901 being 16.8 per cent. and from 1901 to 1911 10.2 per cent.

Population, with percentage of increase over 1901 of the larger towns (after London) in England, census of 1911: Liverpool, 746,421 (6.0); Manchester, 714,333 (10.8); Birmingham, 525,833 (0.5); Sheffield, 454,632 (11.1); Leeds, 445,550 (3.9); Bristol, 357,048 (5.3); West Ham (in the "outer ring"), 289,030 (8.1); Bradford, 288,458 (3.1); Kingston-upon-Hull, 277,991 (15.7); Newcastle-upon-Tyne, 266,603 (7.9); Nottingham, 259,904 (8.4); Stoke-on-Trent, 234,534 (9.2); Salford, 231,357 (4.7); Portsmouth, 231,141 (22.3); Leicester, 227,222 (7.4); Cardiff (in Wales), 182,259 (10.9); Bolton, 180,851 (7.5); Croydon (in the "outer ring"), 169,551 (26.6); Willeddon (in the "outer ring"), 154,214 (34.3); Rhondda (in Wales), 152,781 (34.3); Sunderland, 151,159 (3.5).

The population of Scotland from 1901 to 1911 increased 287,342. A large part of this increase was in the suburbs of Glasgow; Lanarkshire increased by 107,786 and Renfrewshire by 45,594. Most of the remaining increase was in Fife, with 48,894, Dumfriesshire, 25,966, Edinburghshire, 18,866, and Stirlingshire, 18,712. The larger municipal boroughs, with 1911 population and increase per cent. over 1901, are: Glasgow, 784,455 (1.1); Edinburgh, 320,315 (0.9); Dundee, 165,006 (1.2); Aberdeen, 163,331 (6.2); Govan, 89,725 (9.2); Paisley, 84,447 (6.4); Leith, 80,489 (3.9); Greenock, 75,140 (9.0); Partick, 66,848 (23.1); Coatbridge, 43,287 (17.0); Motherwell, 40,378 (29.6); Kirkcaldy, 39,600 (16.2).

In Ireland, the population decreased between 1901 and 1911 in all counties except Dublin, Down, Kildare, and Antrim, where the increases were 6.4, 5.2, 4.6, and 3.7 respectively. The city of Dublin had in 1911 309,272 inhabitants (increase 6.4 per cent.); with suburbs, 403,030 (7.4). The suburbs are the following urban districts: Rathmines and Rathgar, 38,190 (17.1); Pembroke, 29,260 (13.4); Kingstown, 17,227 (0.9); and Blackrock, 9081 (4.2). The population within the Dublin Metropolitan police district was 415,866, against 392,797 in

1901. Increase of population is noted in the other large Irish towns: Belfast, 385,492 (10.4); Cork, 76,632 (0.7); Londonderry, 40,799 (2.3); Limerick, 38,403 (0.7); Waterford, 27,430 (2.5).

The following table shows the rate, per thousand of population, of births, deaths, and marriages, i. e., persons married:

		E. & W.	Scot.	Ire.	U. K.
Births	1901.....	28.5	29.5	22.7	28.0
	" 1910.....	25.1	26.2	25.3	25.0

PUBLIC EDUCATION. In England and Wales, on July 31, 1911, departments in the ordinary public elementary schools numbered 32,206; accommodations, 6,807,540; teachers, 40,909 men, 122,414 women; pupils enrolled, 3,045,074 boys, 2,987,644 girls; average attendance 89.01 per cent. On the same date there were 47 higher elementary schools, having accommodations for 12,449, with 421 teachers, 10,036 pupils enrolled (average during the year), and an average attendance of 91.3 per cent. For public secondary education there were on January 31, 1911, 971 schools recognized for grant, having full-time teachers, 5123 men and 4896 women, and full-time pupils enrolled 86,843 boys and 73,718 girls. At evening and similar schools, pupils in 1910 numbered 763,275; in day technical classes, 10,913; at technical institutions, 2731; in art classes, 3341; at schools of art, 42,278. Teachers are trained at pupil-teacher centres, training classes, and hostels.

In Scotland, for the year ended August 31, 1911, there were 3173 public primary schools in receipt of grants, with accommodations for 1,036,784 pupils, 820,611 pupils enrolled, and 731,905 in average attendance; 196 higher grade schools in receipt of grants, with 24,444 pupils enrolled and 24,083 in average attendance; 1119 continuation classes, with 137,180 pupils. Teachers in elementary schools (primary and higher grade) numbered 5326 men and 14,786 women. There were 56 secondary schools claim-grant, with 1147 teachers, an enrollment of 20,532, and an average attendance of 19,354.

In Ireland, on December 31, 1911, public primary schools in operation numbered 8289, with accommodations for 766,002, enrollment, 684,634, average attendance, 512,862, teachers, 13,033.

PAUPERISM. The mean number of paupers, and the ratio per thousand of estimated population relieved on January 1 and on July 1

preceding (exclusive of casual paupers and insane), are reported as follows for England and Wales:

	Indoor		Outdoor		Total	
	No.	Ratio	No.	Ratio	No.	Ratio
1902.....	195,528	6.0	497,500	15.3	692,875	21.2
1911.....	256,100	7.2	503,181	14.1	758,278	21.2
1912.....	248,035	6.9	403,552	11.2	650,626	18.0

Of whom able-bodied adults:

	No.	Ratio	No.	Ratio	No.	Ratio
1902....	35,095	1.1	59,586	1.8	94,681	2.9
1911....	52,889	1.5	71,383	2.0	124,272	3.5
1912....	50,884	1.4	69,333	1.9	120,217	3.3

* Deductions are made from total for paupers receiving both indoor and outdoor relief on the same day.

In parishes in Scotland, the number of poor persons of all classes receiving relief on January 15, 1911, was 67,026 paupers and 41,306 dependents; on January 15, 1912, 67,581 and 41,058. In Unions in Ireland, the number of paupers in receipt of relief at the close of the first week of January, 1911, was 80,658 (of whom 4778 were able-bodied adults receiving indoor relief); 1912, 79,636 (4609).

AGRICULTURE. The table below shows the total area in acres (including rivers and lakes, but not including foreshore and tidal waters) and the total cultivated area (in the first week in June, 1912), in Great Britain, in Ireland, and in the United Kingdom, including the Isle of Man and the Channel Islands:

	Gr. Brit.	Ireland	U. K.
Total acres	56,804,258	20,731,244	77,721,256
Cultivated 1896.....	32,562,359	15,195,027	47,883,008
" 1901.....	32,417,445	15,219,175	47,760,585
" 1906.....	32,266,755	14,804,182	47,195,762
" 1910.....	32,145,930	14,661,045	46,931,637
" 1911.....	32,094,658	14,707,808	46,926,500

Area in acres under the principal crops, in the first week in June, 1911 (figures for United Kingdom include the Isle of Man and the Channel Islands):

	Gr. Brit.	Ireland	U. K.
Wheat	1,906,038	45,056	1,952,422
Barley	1,597,930	158,110	1,758,842
Oats	3,010,671	1,040,185	4,071,927
Rye	46,374	9,028	55,474
Beans	311,833	1,683	313,667
Peas	167,903	301	168,311
Total corn crops.	7,040,749	1,254,431	8,320,643
Potatoes	571,801	591,259	1,175,158
Turnips and swedes	1,563,390	270,805	1,842,226
Mangold	452,320	77,857	530,927
Other green crops..	452,505	73,806	529,503
Total green crops	3,040,016	1,013,727	4,077,814
Rotation grass*....	4,119,808	2,594,988	6,759,582
Permanent grass....	17,446,870	9,763,999	27,239,778

* Including clover, etc.

The number of livestock in the first week of June, 1911, is shown below (the figures for horses include only horses used for agriculture, unbroken horses, and brood mares):

	Gr. Brit.	Ireland	U. K.*
Horses	1,480,575	543,136	2,033,216
Cattle	7,114,264	4,711,720	11,866,111
Sheep	26,494,992	3,907,436	30,479,807
Swine	2,822,154	1,415,119	4,250,013

* Including the Isle of Man and the Channel Islands.

Production of principal crops in imperial bushels, long tons, or hundredweights, and average yield per acre in 1911:

	Great Britain		Ireland	
In bushels:	Production	Per acre	Production	Per acre
Wheat	62,657,368	32.87	1,656,084	36.76
Barley	50,988,604	31.91	6,814,613	43.08

Bar gold, ounces	14,004	5,797	2,427
£	52,147	21,222	8,088

* From British ores. † From foreign ores.

Total spot value of coal and metals named above: 1900, £160,805,154; 1905, £115,552,434; 1910, £143,773,197.

FISHERIES. The value of fish (exclusive of salmon) landed on the coasts of the United Kingdom is as follows:

	1910	E. & W.	Scotland	Ireland	U. K.
Fish, wet	£7,965,863	£3,100,387	£316,500	£11,382,740	
Shellfish	228,424	69,760	59,130	357,314	
Total	8,194,277	3,170,147	375,630	11,740,054	
Fish, wet	£8,051,486	£2,978,000	£315,679	£11,345,165	
Shellfish	273,012	67,355	58,406	398,773	
Total	8,324,498	3,045,355	374,085	11,743,938	

The most valuable fish taken in 1911 were herring, haddock, and cod, which totalled respectively £3,145,943, £1,793,260, and £1,705,136.

COMMERCE. Total imports, imports re-exported, and net imports (that is, imports for home consumption) have been valued as follows (exclusive of specie and bullion, of foreign merchandise transhipped under bond, and of diamonds from the Cape of Good Hope):

	Total Imports	Re-exports	Net Imports
1901	£521,990,198	£ 67,841,892	£454,148,306
1906	607,888,500	85,102,480	522,786,020
1909	624,704,957	91,344,819	533,360,138
1910	678,257,024	103,761,045	574,495,979
1911	680,167,527	102,759,134	577,398,393

Value of diamonds exported from the Cape of Good Hope to the United Kingdom: 1901, £4,877,042; 1906, £9,179,333; 1909, £6,169,953; 1910, £8,480,875; 1911, £8,267,044.

Imports of gold and silver specie and bullion: 1901, £32,217,306; 1906, £63,330,653; 1909, £66,506,718; 1910, £71,422,077; 1911, £62,987,500.

Total exports, re-exports of foreign and colonial produce, and domestic exports (that is, exports of the produce and manufacture of the United Kingdom) have been valued as follows (exclusive of specie and bullion and of foreign merchandise transhipped under bond):

	Total Exports	Re-exports	Dom. Ex.
1901	£347,864,268	£ 67,841,892	£280,022,376
1906	460,677,818	85,102,480	375,575,338
1909	469,625,166	91,344,819	378,280,347
1910	534,146,817	103,761,045	430,384,772
1911	556,878,432	102,759,134	454,119,298

Exports of gold and silver specie and bullion: 1901, £26,015,102; 1906, £61,482,552; 1909, £60,034,718; 1910, £64,724,213; 1911, £57,024,077.

Total imports of merchandise and domestic exports of merchandise in 1910 and 1911 are shown by classes in the table on page 284.

Exports reported in this table include only domestic merchandise. Re-exports (that is, exports of foreign, including colonial, merchandise), under the same classification, were as follows in 1910 and 1911 respectively: Section I., £12,873,975 and £14,311,306; Section II., £63,310,059 and £59,957,708; Section III., £27,342,345 and £28,344,970; Section IV., £234,606 and £145,150; total £103,761,045 and £102,759,134.

Leading imports not specified in the table were as follows in 1910 and 1911, in thousands of pounds sterling: Wheat, 44,101 and 38,910; sheep wool, 33,812 and 32,978; butter, 24,403 and 24,601; rubber, 20,097 and 18,333; sawn fir, 16,304 and 15,147; bacon, 13,391 and 14,463; refined sugar, 13,133 and 14,353; tea, 11,381 and 12,983; unrefined sugar, 11,421 and 12,233; fresh and refrigerated beef, 11,745 and 11,134; fresh and refrigerated mutton, 9803 and 9576; broad stuffs (silk), 9398 and 9303; tin (block, etc.), 7100 and 8739; eggs, 7206 and 7968; cheese, 6812 and 7140.

Leading domestic exports not specified in the table, in 1910 and 1911, in thousands of pounds sterling: Cotton piece goods, 78,685 and 90,513; coal, 36,100 and 36,521; cotton yarn, 13,338 and 15,663; woolen tissues, 12,566 and 13,303; worsted tissues, 9958 and 9315; galvanized sheet iron, 7426 and 7614; tin plate, 6545 and 6843; textile machinery, 7614 and 6779; woolen and worsted yarn, 6549 and 6477; linen piece goods, 6115 and 5642; herring, 4034 and 4913; thread, 4193 and 3978; pig iron, 4139 and 3889; sulphate of ammonia, 3377 and 3820; war vessels, 4895 and 26.

The following table shows the value of merchandise consigned from and to foreign countries and British possessions, in thousands of pounds sterling, discriminating total imports and imports for consumption, or net imports, and total exports and domestic exports, or exports of the produce and manufacture of the United Kingdom:

	Total Imports	Net Imports
	1910	1911
From for. c'tries...	507,807	508,898
From Br. poss....	170,450	171,260
	120,670	121,946

	Total Exports	Dom. Exports
	1910	1911
Total	678,257	680,158
To foreign c'tries...	374,743	384,937
To Br. possessions...	159,403	171,941

Total 534,146 556,878 430,385 454,119
 * Re-exports in excess of imports to unknown countries were about £67,000 in 1910, and about £55,000 in 1911.

SHIPPING. Total net tonnage entered and cleared, with cargo and in ballast (exclusive of the coasting trade):

	Entered	British	Foreign	Total
1901*	31,170,534	17,210,729	48,381,263
1910	39,641,620	27,018,829	66,660,449
1911	40,777,476	28,387,039	69,164,515
Cleared				
1901*	31,099,487	17,199,144	48,298,631
1910	40,173,466	27,196,399	67,369,865
1911	41,107,978	28,636,848	69,744,826

* Exclusive of tonnage for war purposes to and from South Africa.

Total imports and domestic exports of mer-

chandise by principal countries, in thousands of pounds sterling:

	Imports	Exports
	1910	1911

Total	156,845,461	165,557,111
IV. Miscellaneous and Unclassified†.....	2,554,347	2,483,418
Grand Total	678,257,024	680,157,527

* Other than machinery, and telegraph, and telephone wire. † Including parcel post. ‡ Refined tallow and animal fat were classified in Section II. in 1910 and in Section I. in 1911.

In 1911 entered steam 67,252,999 tons, cleared 67,844,960; total entered with cargo, 41,946,461, cleared 59,263,314. Leading foreign tonnage entered, in thousands, in 1910 and 1911 respectively: German, 6920 and 7012; Norwegian, 4360 and 4751; Dutch, 2636 and 2861; Danish, 2778 and 2787; Swedish, 2542 and 2657; French, 1587 and 1733; Spanish, 1403 and 1426. American tonnage entered was only 246,744 in 1910 and 219,541 in 1911. In 1910 and 1911, total net tonnage entered in coasting trade, 61,808,816 and 62,508,897 (57,605,740 and 58,247,243 British); cleared, 61,569,327 and 62,096,225 (57,444,022 and 57,905,596 British). Merchant marine of the United Kingdom including Jersey, Guernsey, and the Isle of Man, December 31, 1911: 12,242 steamers, of 10,717,511 tons net and 17,743,746 gross; 8830 sailing vessels, of 980,997 tons net and 1,064,713 gross; total, 21,072 vessels, of 11,698,508 tons net and 18,808,459 gross, against 21,090 of 11,555,663 tons net and 18,468,895 gross December 31, 1910.

COMMUNICATIONS. The length of railway open to traffic December 31, 1911, was 23,417 miles (13,106 double track or more, 10,311 single), compared with 23,387 at the end of 1910 and 22,078 at the end of 1901. During 1911 the total mileage in operation in England and Wales increased from 16,148 to 16,200; in Ireland an increase of a single mile is reported, from 3401 to 3402; in Scotland there was a decrease from 3838 to 3815. Total paid-up capital of railway companies in the United Kingdom December 31, 1911, £1,324,018,000 (£1,318,515,000 in 1910); average rate of dividend or interest in 1911, 3.59 per cent. (3.53 in 1910); gross receipts, £127,199,570 (£123,925,565), of which £109,189,734 in England and Wales, £13,498,609 in Scotland, and £4,511,227 in Ireland; working expenditure, £78,617,824 (£76,569,676); net receipts, £48,581,746 (£47,355,889); proportion of working expenditure to gross receipts, 62 (62). Length of tramways and light railways open at the end of 1911, 2597 miles (2562 in 1910); paid-up capital, £74,725,440; gross receipts, £13,777,001; working expenses, £8,500,941; net receipts, £5,276,060.

RAILWAYS. During the year progress was made with the Euston to Watford Railway, of the London and North-Western, and the section from Willesden to Harrow and from Watford High-street to Croxley Green; and the branch to Holywell in Flintshire was opened in July. The Great Northern was completing a 15-mile line from Kirkstead to Little Steeping, to reduce the distance between Lincoln and Skegness. Considerable improvement was in progress in widening the Bytham to Stoke tunnel, south of Grantham, and improving its approaches over a distance of about 8 miles. A line from Cuffley to Hertford of 6 miles in length, and a tunnel of 2700 yards long were also started. The Great Central Railway was widening the line between Dartnall and Woodhouse and eliminating a 300-yards long tunnel at Dartnall. The Great Western Railway was reconstructing its Snow Hill station at Birmingham and completing a line in the Swansea district from Briton Ferry Road station to connect with the Llanelly-Llandilo branch. Improvements were being made at Paddington station and the extension of the Bakerloo tube to

Queen's Park was contracted for. The London, Brighton and South Coast Railway extended its electrification during the year and had a total of 26 route miles in operation. New station works at Dover harbor for the South-Eastern and the Chatham lines made progress during the year, and in London considerable was accomplished at the Waterloo terminus of the London and South-Western Railway. The branch of the Shropshire and Montgomeryshire from Kinnerley to Criggion, which had not been used for 30 years, was reopened for freight traffic and a new bridge built across the River Severn, while a new and enlarged station at Letchworth was under construction. In Yorkshire the Derwent Valley Light Railway, 16 miles in length, from the Foss Islands mineral branch to Cliff Common near Selby, was under consideration, to connect two lines of the North-Eastern Railway.

The length of state telegraph lines March 31, 1911, was 61,296 miles; wire, 1,239,095 miles; postal telegraph offices, 11,451; other offices, 2508; exchange telephones, 110,796; post offices, 24,098. Letters delivered in the fiscal year 1912, in millions, 3186.8; newspapers and half-penny packets, 1265.5; postcards, 905.5.

FINANCE. The unit of value is the pound sterling, worth \$4.86656 (7.98805 grammes gold .91666 fine). For years ended March 31, the following table shows budget estimates of revenue, actual receipts into the exchequer, and the excess (+) or deficiency (—) of the actual, as compared with the estimated amounts:

	Estimates	Receipts	Difference
1902	£ 152,263,000	£162,712,089	+ £ 449,089
1907	152,590,000	155,036,486	+ 2,446,486
1910	162,590,000	131,696,456	— 30,893,544
1911	*199,791,000	203,850,588	+ 4,059,588
1912	181,621,000	185,090,286	+ 3,469,286

* Including arrears of 1909-10, estimated at £30,046,000.

For fiscal years, the table below shows budget and supplementary estimates of expenditure, actual issues out of the exchequer chargeable against revenue, and the surplus (+) or deficit (—) of actual receipts (shown in foregoing table), as compared with actual expenditure:

	Estimates	Issues	Surp. or Def.
1902	£206,651,259	£205,236,305	— £25,524,216
1907	152,636,443	149,637,664	+ 5,398,822
1910	163,171,000	157,944,611	+ 5,606,766*
1911	174,129,000	171,995,667	+ 2,133,333
1912	181,839,000	178,545,100	+ 6,545,186

* Income and expenditure for fiscal years 1910 and 1911 were aggregated for the purpose of determining the Old Sinking Fund for 1911.

Revenue (exchequer receipts) was derived as follows, in the years ended March 31, 1911 and 1912: Customs, £33,140,000 and £33,640,000; excise, £40,020,000 and £38,380,000; estate, etc., duties, £25,452,000 and £25,392,000; stamps (exclusive of fee and patent stamps), £9,784,000 and £9,454,000; land tax, £1,220,000 and £750,000; house duty, £3,080,000 and £2,130,000; property and income tax, £61,946,000 and £44,804,000; land value duties, £520,000 and £481,000 (total from these sources, £175,162,000 and £155,040,000); post and telegraph service, £24,350,000 and £25,700,000; crown lands (net

receipts), £500,000 and £530,000; receipts from Suez Canal shares and sundry loans, £1,234,350 and £1,281,497; fee and patent stamps, £1,070,000 and £1,031,000; receipts by civil departments, etc., £1,534,238 and £1,507,789; total, £203,850,588 and £185,090,286.

Expenditure (exchequer issues) chargeable against revenue in the years ended March 31, 1911 and 1912:

	1911	1912
I. Consolidated Fund Services:		
National debt services	£ 24,554,004	£ 24,500,000
(Interest of funded debt)	(15,377,321)	(15,202,702)
(New Sinking fund)	(4,111,961)	(4,447,706)
Road improvement fund, etc.	1,362,641	1,709,859
Local taxation accounts, etc.	9,881,709	9,636,399
Civil list	470,000	470,000
Annuities and pensions	299,933	317,745
Salaries and allowances	56,609	56,572
Courts of justice	514,283	523,000
Miscellaneous	323,488	325,525
Total	37,462,667	37,539,100
II. Supply Services:		
Army (incl. ordnance factories)...	27,449,000	27,649,000
Navy	40,386,000	42,858,000
Civil services	43,098,000	46,001,000
(Education)	(18,744,000)	(18,983,000)
Customs and excise	2,211,000	2,297,000
Inland revenue	1,708,000	1,654,000
Post-office services	19,681,000	20,547,000
Total	134,533,000	141,006,000
Grand total	171,995,667	178,545,100

Estimated revenue for 1912-13, £187,189,000 (against receipts £185,090,286 in 1911-12); estimated expenditure chargeable against revenue, £186,885,000 (against £178,545,100).

The funded debt on March 31, 1912, stood at £602,200,092; estimated capital liability in respect of terminable annuities, £33,044,389; unfunded debt, £39,500,000 (including treasury bills to the amount of £6,400,000 temporarily paid off March 31, but renewable under the revenue act of 1906); total dead-weight debt, £674,744,481 (as compared with £685,232,459 in 1911, £729,505,545 in 1907, and £745,015,650 in 1902). Capital liabilities in addition amounted to £50,061,947; the gross debt in 1912, therefore, was £724,806,428 (as compared with £733,072,010 in 1911, £779,164,704 in 1907, and £765,215,653 in 1902). Total debt services in the fiscal year 1912, £24,500,000 (interest of funded debt, £15,202,702, of unfunded £1,158,842). Assets March 31, 1912: Estimated market value of Suez Canal shares, £44,046,000; other assets, £3,704,386 (estimated); exchequer bank balance of £11,468,591; total, £59,218,977. This amount deducted from the gross debt shows total net liabilities of £665,587,451 (as compared with £677,915,341 in 1911).

ARMY. The chief developments in the British army during the year 1912 were in the main encouraging, though criticism of the condition of the forces was not entirely absent. There was an increase in the number of candidates for commissions, and recruiting was fairly satisfactory, but owing to better conditions of trade and industry there was a shortage in the number of skilled artisans who en-

listed in the more technical branches of the service. New, quick-firing howitzers were being provided for the howitzer batteries of the Royal Field Artillery, and the cavalry was being equipped with an improved sword. The lance, whose utility had figured for the past quarter of a century in discussions of mounted troops, was once more restored to the lancer regiments. A new rifle had been designed and was under test, while new ammunition with a pointed bullet was being issued to the army. This required the re-sighting of the existing rifles. The re-mount question continued to agitate the service and a plan was developed whereby trained cavalry horses could be boarded out. A Royal flying corps was organized during the year and greater attention was being paid to aviation (see **MILITARY PROGRESS** and **AERONAUTICS**). The mechanical transport service was also being developed, as in this respect the British army was held deficient, compared with the continental powers.

Five important changes in the organization and administration of the army were to be noted in 1912. Col. J. E. B. Seeley, D. S. O., succeeded Lord Haldane as secretary of state for war and thereby became head of the army council. Gen. Sir J. D. P. French became chief of the imperial general staff and first military member of the council, having under his authority the director of military operations (Brig.-Gen. H. H. Wilson), the director of staff duties (Brig.-Gen. L. E. Kiggell), and the director of military training (Brig.-Gen. D. Henderson). The other military members of the army council were the adjutant-general (Lieut.-Gen. Sir J. S. Ewart), the quartermaster-general (Maj.-Gen. J. S. Cowans), the master-general of the ordnance (Maj.-Gen. C. F. Hadden), while the parliamentary under-secretary of state was a civil member, as was also the financial secretary. Gen. Sir C. W. H. Douglass was inspector-general of the home forces, and Gen. Sir Ian Hamilton was general officer commanding-in-chief of the Mediterranean, and inspector-general of the oversea forces. The latter was authorized to examine and report upon the coast defences of the Far East in the year 1912-13. The general staff, to which appointments were made for a term of four years, was at work during the year on the general scheme of imperial defense, while a selection board to improve the character of the personnel by a more careful system of promotions was active during the year.

The British army in 1912 was organized in two lines consisting of a regular army with its reserve and special reserve and a territorial force which is a second line providing for home defense and affording an opportunity for training men who might volunteer for foreign service. The first line supplies the garrisons for India, Egypt, South Africa, and other places, besides maintaining at home a sufficiency of troops to make good the quota required for service abroad from its depot battalions. The home forces are organized to afford an expeditionary force ready to take the field, and the United Kingdom was divided into 7 commands, all under lieutenant-generals. The Aldershot, or first command, was maintained as the first force for expeditionary purposes, but the other commands were subdivided into districts on a territorial basis for the localization of the in-

fantry. London, which does not figure in the seven commands, formed an independent district. The general officer commanding-in-chief of each district is responsible for the training, organization, efficiency, discipline, and administration.

The organization of the regular army remained essentially the same as in 1911, and service was by voluntary enlistment, the time being for eleven years, of which a portion, differing with the various arms of the service, was spent with the colors, and the rest of the time in reserve. The time spent with the colors was as follows: Cavalry, 7 years; Royal Horse Artillery and Royal Field Artillery, 6 years (5000 for 3 years); Royal Garrison Artillery, 8 years; foot guards, 3 years; light infantry, 7 years; Royal Engineers, 7 years, and for certain trades, 3 years. In a report on recruiting made in February, 1912, it was stated that in the year ending September 30, 1911, 29,452 recruits, or an increase of 3018 over the previous year, had joined the regular army, while there had been an increase in the sections of the reserve formed by those willing to join in their first year of reserve service without a general mobilization and those reëngaging in the reserve, while there was a decrease in the section of the reserve comprising those who had enlisted for short service and had discharged their active duties. There was also available on mobilization a special reserve consisting of men who were trained in the technical arms of the service and of civilians whose technical training would make them useful for military service. This latter reserve was in a rudimentary state in 1912, and there were decreases to be noted in both divisions, as the special reserve forces do not attract attention. The regular army in 1912 was made up as follows: Cavalry, 31 regiments, of which 3 were household cavalry; 7 dragoon guards; 3 dragoons; 6 lancers, and 12 hussars. There were five recruit depots for the training, posting, and drafting of men. There were four brigades with headquarters at Aldershot, Tidworth, Curragh, and Canterbury, formed of 12 regiments serving at home. The regimental establishment was 696 men and 528 horses. The horse, field, and mountain artillery was organized as 6-gun batteries, except in the case of the heavy batteries and training batteries, to which 4 guns were assigned. There were carried on the rolls 28 horse batteries, 150 field batteries, 8 mountain batteries, and 99 garrison companies, of which 12 were heavy batteries. Of these, 97 field batteries were at home, 72 belonging to the expeditionary forces, including 6 howitzer batteries while 18 were assigned to the 6 training brigades and 7 to the training of the regular reserve. The infantry of the line consisted of the brigade of guards, formed of 4 regiments with 9 battalions, and 67 regiments of infantry of the line, and 2 rifle regiments, with a total of 148 battalions. The plan of organization involves a home battalion for every one of foreign service and depot special reserve battalions for each regiment. Exclusive of India there were 85 troops of Royal Engineers, which included the various technical troops, and an aviation corps was organized during the year. The army service corps organized 80 companies for transport and supply.

The general annual report for 1912 gave the strength and distribution of the regular army or ranks on October 1, 1911, as follows:

England and Wales.....	96,516
Scotland	4,806
Ireland	26,438
Jersey,	733
Guernsey and Alderney.....	970

Making a total of men at home.. 129,503

In the Colonies, Egypt, China, and Cyprus, there were	46,713
In Indian depots in the Colonies.....	323
while in India there were.....	77,770

Making a general total of..... 254,309

at home and abroad. In the army estimates for 1912-13 the total "establishments" were given as home, 134,000; Colonies, Egypt, etc., 45,700; India, 75,886, or a total of 255,866.

The territorial force which was constituted out of the former yeomanry and volunteers was in the hands of council associations, and was organized on a local basis in which the military districts of Great Britain, with the exception of London and districts Nos. 3 and 5, are divisional areas, from which a complete division in addition to other troops were to be drawn. Districts 3 and 5 were each to furnish two divisions and the London district also two divisions. The army estimates of 1912-13 gave the following statistics for the establishment and strength, excluding the permanent staff, but including all ranks, the figures for the strength being as of January 1, 1912:

	Establishment	Strength
Cavalry	26,447	24,925
Artillery	46,605	40,260
Engineers	14,817	13,128
Infantry	204,025	168,759
Army service corps	9,013	7,992
Medical corps	15,211	13,272
Veterinary service	212	90
	316,300	268,438
Officers' training corps.....	943	644
Total	317,273	269,082

The whole army establishments and effectives, both officers and men, are shown in the accompanying table from the Army Estimates of 1912-13:

	Establishments '12-'13	Effectives '11-'12	Jan. 1, '12
Regular forces (Regimental) Home and Colonial (including regular establishment of Special reserves)	163,282	168,239	167,354
Colonial and native Indian corps.....	8,871	8,871	8,801
Army reserve.....	139,000	139,000	137,682
Special reserves (excluding regular establishment)	89,913	91,219	61,951
Militia, U. K.	1,446
Militia, reserve division..	150	500	171
Militia, Channel Islands..	3,166	3,166	3,113
Militia, Malta and Bermuda, and Bermuda volunteers	2,894	2,894	2,682
Territorial force.....	316,307	317,106	268,414
Isle of Man volunteers....	126	126	112
Officers' training corps (officers and permanent staff)	1,008	946	708
Total Home and Colonial establishments	729,717	732,067	652,434
Regular forces (regimental) on Indian establishment	75,886	75,884	77,577
Total	805,603	807,951	729,991

NAVY. Number and displacement of warships (including colonial vessels) of 1500 or more tons, and of torpedo craft of 50 or more tons; built and building, December 1, 1912: Dreadnoughts (battleships having a main battery of all big guns, that is, 11 inches or more in calibre); built, 16 of 334,350 tons; building, 9 of 246,000 tons. Predreadnoughts (battleships of about 10,000 or more tons, whose main batteries are of more than one calibre); built, 40 of 589,385 tons; building, none. Coast-defense vessels (including smaller battleships and monitors): none built or building. Battle cruisers (armored cruisers having guns of largest calibre in main battery): built, 7 of 142,000 tons; building, 4 of 106,300 tons. Armored cruisers: built, 34 of 406,800 tons; building, none. Cruisers (unarmored warships of 1500 or more tons): built, 73 of 374,075 tons; building, 17 of 92,660 tons. Torpedo-boat destroyers: built, 140 of 94,006 tons; building, 44 of 41,580 tons. Torpedo boats: built, 49 of 11,488 tons; building, none. Submarines: built, 70 of 26,108 tons; building, 16 of 13,400 tons. Total tonnage: built, 1,978,212; building, 499,940. Excluded from the foregoing: Ships over twenty years old unless reconstructed and rearmed within five years; torpedo craft over fifteen years old; transports, colliers, repair ships, torpedo depot ships, and other auxiliaries. See **NAVAL PROGRESS** and **BATTLESHIPS**.

The new dreadnoughts that were completed in 1912 were the *Thunderer*, *Monarch*, and *Conquerer*, launched in 1911 on February 1, March 30, and May 1, respectively; the dreadnought *Orion* and the battle cruiser *Lion* were completed late in 1911. These ships carry a battery of 13.5-inch guns, the battleships ten and the *Lion* eight. The battle cruiser *Princess Royal* (launched April 29, 1911) was completed about the end of 1912. It was expected that the dreadnoughts *King George V.* (launched October 9, 1911), *Centurion*, *Ajax* (March 21, 1912), and *Audacious* (September 14, 1912), would be completed in 1913, as well as the battle cruiser *Queen Mary* (March 20, 1912), and the colonial battle cruisers *New Zealand* and *Australia*. The dreadnoughts *Iron Duke* and *Marlborough*, both to be completed in 1914, were launched October 12 and October 24, 1912.

Officers and men in 1912, 137,222, including three admirals of the fleet, 12 admirals, 22 vice-admirals, 55 rear-admirals, and 664 captains and commanders.

GOVERNMENT. The executive authority is vested in the king, acting through his ministers. The legislative body is the Parliament, consisting of the House of Lords and the House of Commons. The peers entitled to sit in the House of Lords in 1912 (including the lords spiritual and temporal and three royal princes), numbered 636. The general election of December, 1910, returned 670 members of the Commons to the second Parliament of George V., which convened January 31, 1911. England has in the Commons 465 members, Wales 30, Scotland 72, and Ireland 103. Party representation November, 1912: Liberals, 262; Laborites, 41; Nationalists, 76; Independent Nationalists, 8; Unionists, 281; total, 668 (two seats being vacant).

The king in 1912 was George V. (born June 3, 1865), who, as second (but only surviving) son, succeeded Edward VII. May 6, 1910. The

heir-apparent is Edward, born June 23, 1894, and created Prince of Wales June 23, 1910.

The ministry in 1912 was that of Mr. Asquith (Liberal), which was formed April 8, 1908. Those of the ministers who constitute the cabinet were as follows at the end of 1912: Prime minister and first lord of the treasury, Herbert Henry Asquith (appointed April, 1908); lord high chancellor, Viscount Haldane (1912); lord president of the council, Viscount Morley of Blackburn (1910); lord privy seal, Marquis of Crewe (1908-11 and 1912); first lord of the admiralty, Winston Spencer Churchill (1911). Secretaries of state: for home affairs, Reginald McKenna (1911); foreign affairs, Sir Edward Grey (1905); colonies, Lewis Vernon Harcourt (1910); war, Col. John E. B. Seely (1912); India, Marquis of Crewe (1910). Chancellor of the exchequer, David Lloyd-George (1908); secretary for Scotland, Thomas McKinnon Wood (1912); chief secretary to the lord lieutenant of Ireland, Augustine Birrell (1907); postmaster-general, Herbert Louis Samuel (1910). President of committees of the council: Board of trade, Sydney Charles Buxton (1910); local government board, John Burns (1905); board of agriculture, Walter Runciman (1911); board of education, Joseph Albert Pease (1911). Chancellor of the duchy of Lancaster, Charles Edward Henry Hobhouse (1911); first commissioner of works, Earl Beauchamp (1910). Up to 1912 the British attorney-general was not included with the cabinet ministers; but in June of that year Sir Rufus Daniel Isaacs, who became attorney-general in 1910, was appointed a member of the cabinet.

HISTORY

OPENING OF PARLIAMENT. The new session of Parliament was opened on February 14 by the king, who a short time before had returned from India. During his absence, November 11, 1911, to February 5, 1912, the crown had been represented by a special commission comprising Prince Arthur of Connaught, the Archbishop of Canterbury, the Lord Chancellor, and Lord Morley. The speech from the throne, after repeating the usual formula that the relations with foreign powers continued to be friendly, referred first to the Turco-Italian War, and the readiness of the British government to associate itself with the other powers when occasion offered for the purpose of mediating between the warring nations; second, to the situation in Persia, concerning which negotiations were going on between Great Britain and Russia as to the best means of restoring order in Persia; third, to the Chinese crisis, as to which the British government was observing the policy of strict non-intervention, while taking steps to protect British life and property; fourth, to the agreement reached at the international conference at The Hague as to the regulation of the trade in opium and other narcotics; fifth, to the recent visit of the king and queen to India, the cordial welcome accorded to them, the transfer of the capital from Calcutta to Delhi, and the changes in the administration growing out of that transfer concerning which a bill would later be laid before Parliament. As to domestic affairs, the speech from the throne, after referring to the prospective danger of disputes between employers and workmen and expressing the hope that

a reasonable spirit might prevail on both sides, promised the following measures for the session: A Home Rule bill; a bill for the disestablishment of the church in Wales; amendments of the law as to franchises and registration of electors; a bill in accordance with the recommendations of the last imperial conference for the amendment and consolidation of the law regarding British nationality; and finally, measures dealing with certain social and industrial reforms.

In the debate on the address from the throne the opposition criticised the government for bringing about the important changes in the administration of India in a manner unconstitutional and indefensible. The government's course in this instance was characterized as part of its policy of doing things behind the back of the House of Commons. As to Persia, the opposition declared that the time had come when more complete information about Persia should be made public. (See *PERSIA, History*.) As to the relations with Germany, Lord Haldane's mission (see following paragraph) was characterized as "mysterious," and it was said that if such a mission were to be undertaken by anyone it should have been by Sir Edward Grey. The government was taunted with its failure to keep the promise of the preamble to the Parliament bill to reconstruct the House of Lords. The Insurance act was bitterly attacked, and the proposal of the government to carry in one session three measures of such extraordinary importance as Home Rule, Welsh disestablishment, and franchise reforms was pronounced absurd. The Liberal side retorted that the administrative changes in India should not be regarded as a reversal of the policy of the partition of Bengal, but merely a rearrangement that seemed necessary in the light of experience. As to Persia, the government still adhered to the policy as set forth by the foreign secretary in December, and had further agreed to be a party to an emergency loan to assist Persia in restoring order to its administration. As to Lord Haldane's mission, the government declared that he was going to Germany in any case, but had hastened his visit in order to engage in friendly communications with those who were responsible for the German foreign policy. The discussion would be an informal one, but would doubtless lead to results of importance and would, at all events, tend to promote friendliness between the two countries. As to Home Rule, it was conceded by everybody to be demanded by a majority of the Irish people. The disestablishment of the Welsh Church was demanded by a majority of the Welsh people. The government admitted that the task before it was one of great magnitude, but saw no reason why it should not be performed within a single session.

LORD HALDANE'S VISIT TO BERLIN. The visit of Lord Haldane to the German capital on February 9 gave rise to much discussion in the press. The object of his visit was not definitely described, but it was assumed to be the discussion of the relations between England and Germany, in order to promote a better understanding in each nation of the policy of the other. He was received with high honors by the emperor and the heads of the state. He held long conversations in the foreign office with Herr von Stumm, the head of the political department. On July 25 Mr. Asquith announced that

the interchange of views which began with this visit was still continuing "in a spirit of perfect frankness and friendliness" on the part of both governments.

HOME RULE. A leading topic of discussion in connection with Home Rule during the year was the hostility of the Ulster Protestants to that measure. The movement in Ulster against Home Rule was started in 1911 and before the close of the year it had assumed serious dimensions. The wrath of the Ulster men was greatly provoked by the announcement that Mr. Winston Churchill, Mr. John Redmond, and others would hold a Home-Rule meeting at Ulster Hall, Belfast, on February 8. The standing committee of the Ulster Unionist Council held a meeting on January 16 and announced their intention to take steps to prevent this. There was much discussion of this action and even rumors that violence at Ulster Hall, the traditional gathering-place of Irish Unionists, might result if the plan for a meeting was carried out. Certain prominent Unionists went so far as to say that "bloodshed was inevitable." The campaign against Home Rule began vigorously about the middle of January, and many speeches were made on the subject both in Ireland and in England. Sir Edward Carson, the leader of the Irish Unionist party, referred openly to the possibility of a conflict with the forces of the crown, saying that the men of the North of Ireland must resist, no matter how great the cost or the suffering. He declared that Mr. Winston Churchill's plan for the Belfast meeting was merely an attempt to provoke disorder by challenging the Irish Unionists. The Unionists in the South of Ireland were not so extreme in their views, though sympathetic with the purposes of the Ulster men, for if any difficulty arose they would be the first to suffer from the reprisals of the Nationalists.

The Belfast meeting took place at the time appointed, February 8, but the plan of holding it at Ulster Hall was given up and it was held in an athletic field. The speech was heartily applauded and the convention passed off quietly without any disturbance. The speaker referred to the safeguards for the Protestants of Ireland against any oppressive laws. He said that the Irish parliament would be fully and fairly representative of the Irish nation, including Protestants as well as Catholics; that the crown would be able to withhold consent to an unjust bill; that the imperial Parliament could repeal such a bill, and that finally the Home Rule bill would contain provisions safeguarding religious freedom and rendering justice to Catholics and Protestants alike. Moreover, the privy council could throw out any law that exceeded the limits laid down by the Home Rule bill. It was thought likely that the imperial Parliament, overwhelmingly Protestant, would not fail to resent religious intolerance or interference, and the right of the imperial Parliament to take such action was unquestioned at law and equally unquestioned in fact. As to financial injury to Ulster he declared that there would be no danger of unfair taxation. There was a Home Rule demonstration at Dublin on March 31, at which about 100,000 persons were present. All during the summer the resistance of Ulster was the subject of acrimonious debate. The government blamed the opposition for trying to justify the threats of the Ulster men and the opposition

took their stand on the "liberties of Englishmen." There was much talk of an "Ulster covenant" to resist Home Rule if it should ever be established.

THE ULSTER DEMONSTRATIONS. The long-expected and much-discussed demonstrations of the Ulstermen against Home Rule began with an open-air meeting at Enniskillen on September 8, attended by some 30,000 persons and presided over by Sir Edward Carson. The programme included the holding of mass-meetings of protest during a period of ten days, and the signing on September 28, known as "Ulster Day," of a "solemn covenant" to resist the Home Rule bill. The Enniskillen meeting carried a resolution reasserting the resolve of the convention of 1892, that "We will not have Home Rule." The speakers justified resistance on the ground of self-defense. The words of the opposition leader, Mr. Bonar Law, were quoted: "If the Government attempt under existing conditions to drive the people of Ulster by force from the protection of this House of Commons and British law, I can imagine no means too strong for the people of Ulster to take to prevent it." Similar meetings were held during the next ten days, culminating in the signing on Ulster Day after impressive ceremonies in Ulster Hall at Belfast of the "solemn covenant" in which the Unionists declaring that Home Rule would be disastrous to Ulster as well as to the rest of Ireland bound themselves to "stand by one another in defending for ourselves and our children our cherished position of equal citizenship in the United Kingdom, and in using all means to defeat the present conspiracy to set up a Home Rule parliament in Ireland." They further declared that if such a parliament were forced on them they would refuse to recognize its authority. On September 15 there had been a riot at Belfast, attributed to party feeling, in which about 100 persons were injured, and during the Ulster days there was a less serious riot at Londonderry, but in general the Ulster demonstrations passed off with less disturbance than had been anticipated.

Although many were disposed to belittle the Ulster movement it made a serious impression on the Liberal party, even on some of its most radical members, who admitted that Ulstermen might have a serious grievance and who urged the government to proceed slowly. It strengthened the demand for a referendum of the Government for Ireland bill. On this the Unionists insisted on the ground that the last election did not turn specifically on Home Rule and that on so important a subject the electorate must be consulted. They held that it was criminal folly to proceed to so radical a measure as the coercion of Ulster without its endorsement by the British electorate. Moreover, they declared that no plan for Home Rule should include Northeast Ulster and to the Liberal reply that no one in Ireland would accept Home Rule if it did not include Northeast Ulster they retorted that no Home Rule measure ought, therefore, to be passed. Thus between the extremists on each side matters came to an *impasse*, but many Radicals argued that it was by no means impossible to find a way of protecting the rights of the Ulster minority without sacrificing the interests of the Irish majority. Hints of a possible solution through a federal system of "Home Rule

all around" were thrown out, but they took no definite shape. The arguments for excluding the four counties were ably stated by Mr. Balfour in Parliament when the bill reached the committee stage on June 11 (see below). He pointed out that to retain the four Ulster counties (Antrim, Down, Londonderry, and Armagh) against their will under a Nationalist government would leave the Nationalists precisely the same problem with which the British Parliament was struggling, for the men of the North would persistently demand Home Rule for themselves. Moreover, Ulster comprised the wealthiest and most vigorous and determined part of the population. If the British government cannot now rule Ireland on account of the opposition of the Nationalists, who are a small fraction of the population of the United Kingdom, how, he asked, could the latter expect to impose their rule on this powerful and hostile element who would insist in like manner on the right of self-government?

HOME RULE BILL. The Government of Ireland bill, as the government's Home Rule measure was officially entitled, was introduced by Mr. Asquith on April 11. Its chief features were as follows: The principle was definitely asserted that the supreme authority rested in the imperial Parliament. Under this authority Ireland was to receive real autonomy in all Irish concerns. It provided for an Irish parliament consisting of a senate and a house of commons, with power to make laws for Ireland, but certain classes of legislation were reserved from its jurisdiction. For example, Parliament could not establish or endow any religion or impose any religious disability, or make any conditions affecting the validity of marriage, or legislate in any of the following matters: Peace or war, naval or military affairs, treaties with foreign powers, titles or dignities, treason, trademarks, copyright, patents, currency, foreign commerce, and other subjects specifically excluded. The Irish constabulary was to remain under imperial control until six years after the passage of the act, when it was to be transferred to the jurisdiction of the Irish parliament. The lord-lieutenant had power to veto any act contrary to the principles of the Home Rule bill. The senate was to consist of forty members, nominated in the first instance by Great Britain, and succeeded as their terms became vacant by the appointees of the Irish executive. The house of commons was to consist of 164 members elected by Irish constituencies. Ulster was to have fifty-nine members. If the two houses disagreed they were to sit and vote together. Taxes other than post-office duties were to be collected by the imperial government and received by the imperial exchequer, and each year the latter is to transfer to the Irish exchequer the estimated contribution of Ireland. The Irish parliament was under obligation to pay the cost of the Irish services at the time of the passage of the act. Besides the Irish constabulary, the following services would be excluded from the jurisdiction of the Irish parliament for the present: The land-purchase tax, old-age pensions, national insurance, postal savings banks, and the service of public loans before the passage of the act. The Irish parliament was free to impose excise and other taxes of its own and to increase those now existing, but could levy no new customs duties or add to

the imperial duties on beer or spirits. As to representation in the imperial Parliament, Ireland was to have forty-two members, according to the present plan, one for about every 100,000 of the population. The executive was vested in the king, represented by the lord-lieutenant and an Irish ministry named by the Parliament. The lord-lieutenant may name additional ministers from time to time as he finds it necessary.

The financial provisions were commonly regarded as presenting the chief difficulties. The problem was in effect how to create a budget within a budget. Ireland had hitherto been administered on a costly scale by the imperial government and the task of devising a financial system suited to her relatively small resources and of linking it with that of the United Kingdom was exceedingly difficult. Orangemen and Conservatives declared it impossible. The budget provisionally established by the new law showed a deficit of £1,515,000, due largely to the cost of old-age pensions. This burden, as well as that imposed by the Land Purchase act, would inevitably increase. To deal with financial questions arising from the new law, the plan provided for a joint exchequer board consisting of two members named by the imperial Parliament, two named by the Irish parliament, and a president appointed by the king. The plan also included the creation of a financial ministry at Dublin. The imperial exchequer, which is to continue to receive all duties for Ireland as well as for Great Britain, will, according to this plan, turn over each year to the Dublin exchequer the amount which the new exchequer board decides to be Ireland's share of the cost of government at the time of the passage of the law; also the sum of £5,000,000, which at the close of the third year after Home Rule goes into effect shall be reduced annually by £50,000 until it reaches the limit of £200,000; also a sum which in the opinion of the exchequer board equals the returns from the taxes imposed by the Irish parliament.

Among the serious questions arising from the financial clauses, was the possibility that the powers which they conferred might lead to the imposition of duties on British imports. This was regarded as one of the vulnerable points of the bill. Another question was whether the law left the British Parliament the power to raise taxes in Ireland after the creation of the Irish parliament. The bill was silent on that point save in so far as the guaranty that the supreme authority of the imperial Parliament should not be diminished might be taken to cover it. The first reading of the Home Rule bill was carried in the House of Commons on April 16 by 360 against 266, a majority of 94. In the debate on that and subsequent occasions, the arguments advanced may be briefly summarized as follows: The Unionists contended that the bill in no wise met the demands of the Irish Nationalists, while it introduced confusion, uncertainty, and injustice into the administration. They ridiculed the talk about the supremacy of the imperial Parliament. Mr. Balfour declared that there was no more reality in the claim of imperial supremacy than in the pretensions of British sovereigns during several centuries of the French rule. The bill was, he said, simply an installment of federalism. The principle would have eventually and logically to apply to

England, Scotland, and Wales as well as to Ireland. "For an indefinite time we should be left with a lop-sided federal system, unworkable, and unworthy of the statesmanship of the country." The financial proposals were criticised. Fear was expressed that customs barriers would be set up between Ireland and England. The provision for forty-two Irish members at Westminster was attacked for varying reasons. The main point, however, in the opposition appeared to be the coercion of Ulster under a government to which it would be opposed. This was characterized as tyranny over the minority and as likely to result in religious persecution and even in bloodshed.

A crowded meeting of Nationalists was held at the Mansion House, Dublin, on April 23, and speeches were delivered by Mr. Redmond, Mr. Dillon, and others, to an enthusiastic audience. The convention voted confidence in the government proposals. The second reading was carried on May 9 by a vote of 372 to 271, and on June 11 it went into committee. Amendments to exclude from its operation the four Ulster counties and to strike out the provisions for an Irish senate were rejected. After Parliament had reassembled on October 7 the government proposed a motion assigning thirty-four days for the consideration of the bill, of which twenty-five days were for the committee stage, seven for the report stage and the remaining two days for the third reading. The opposition protested violently at this resort to the "guillotine." A government amendment providing for the principle of proportional representation in the election of members to the Irish senate after five years was passed on October 31 by a vote of 208 to 209. On November 11 the government was suddenly checked by an adverse vote in peculiar circumstances. The financial resolution passed the committee stage on November 7 by a majority of 121. This resolution, which was a vital part of the Home Rule measure, reached its report stage on November 11, and on that day Sir F. Banbury moved an amendment seriously changing its character. It happened that many Liberals were absent from the House, Sir F. Banbury having failed to place the amendment upon the notice paper, and after a brief debate the amendment was carried by a vote of 227 to 206. The House was immediately adjourned and for a time there was threat of a deadlock over the parliamentary question involved. On November 13 an opposition motion was rejected by a vote of 327 to 218. Disorder followed and the sitting was suspended; but on the following day it was agreed at the suggestion of the speaker that the House should adjourn till November 18 "for reflection," and upon reassembling a new financial resolution differing from the original in important respects, was carried by a vote of 318 to 207. This loss of time resulted in the abandonment of a measure regarded as very important by the government, namely, the Mental Deficiency bill (see below) which, however, the government promised to reintroduce in the next session.

SITUATION AT THE CLOSE OF 1912. The House bill was carried through the committee stage within the appointed time except for a delay of ten days caused by an adverse vote which temporarily checked the government, but which was corrected by a full majority later. It was expected that by the end of the session, March 30,

1913, the government would have carried the Home Rule and Welsh Disestablishment measures and the franchise bill abolishing plural voting. It was expected that the Home Rule bill would be rejected by the House of Lords, and then two years would have to elapse before it could be carried by the Commons alone. Toward the end of the year the government was planning to attack the land question, that is the question of breaking up the large estates which do not pay their full share of taxation. In December Mr. Lloyd-George made an address on this subject at Aberdeen denouncing the "iniquitous land laws." The large estate tended to monopoly and to drive the rural people to cities or abroad.

WELSH DISESTABLISHMENT. The long-promised bill for the disestablishment of the Church of England in Wales was introduced on April 23. It provided that on the first day of July after the passing of the act, the four Welsh dioceses should cease to be dioceses for the province of Canterbury; the ecclesiastical corporations within them would be dissolved and ecclesiastical jurisdiction would be abolished. Synods were to be held to provide for the future government of the Church. The bill provided for Welsh commissioners, three in number, for a period of three years, who should receive existing Church property and distribute it. The disestablished Church was to set up a representative body to which should be transferred all cathedrals, churches, palaces, etc. All the modern endowments were to be handed over by the commissioners to this representative body. The measure was criticised by the opposition with great bitterness, both as to its general purpose and its special features. It was denounced as a blow aimed at the Church of England as a whole, as well as at the Church in Wales. The first reading was carried in the House of Commons by a vote of 331 against 253. During the summer several mass-meetings were held to protest against the measure, including gatherings at Hyde Park, and the Albert Hall, on June 12, where addresses were made by Mr. Bonar Law and the Archbishop of Canterbury.

LABOR UNREST. The year 1912 was marked by very disturbed conditions of labor. The great textile-workers' strike in the Manchester district was in progress when the year began. In May occurred the strike of the London dockers, and toward the close of the year the North-Eastern Railway men went on strike. But by far the most serious movement of the year was the great coal-miners' strike which took place in March. A summary of this and the other labor contests will be found in the articles **STRIKES** and **MINIMUM WAGE**, but an account of the coal strike and the minimum wage law is given here because of the serious issues in national politics to which they gave rise.

THE COAL STRIKE AND THE MINIMUM WAGE. At the beginning of 1912 the agitation for a minimum wage for coal miners, which had been going on for a long time, resulted in the formulation of definite demands on the part of the miners, which the coal owners steadily opposed. These demands comprised a scale of minimum wages for the different mining districts of the United Kingdom. To meet the objections of the coal owners, the miners reduced the rate demanded in some of the districts, but still contended for the principle of the mini-

mum wage. On January 12 the Miners' Federation referred the question of a strike to the miners, and the vote was generally in its favor. Thereupon the federation gave the employers notice that work would be stopped by the end of February. A national conference between coal owners and the miners' representatives was held in London on February 7. The revised scale of minimum wages was presented by the miners, but after consideration the coal owners passed a resolution declaring that the principle of payment in proportion to the amount of work performed was the only one that could be successfully applied. They admitted, however, that owing to exceptional conditions in the working place, certain miners, though doing their best, were unable to earn as much as they would in normal circumstances, and they declared their willingness in such cases to give the subject special consideration. The miners in reply expressed regret that the coal owners would not accept the principle of the minimum wage, which was the only condition of a settlement. Negotiations and conferences between the government and the coal owners and miners were continued, and finally, the government proposed as a basis of settlement that the principle of the minimum wage should be accepted. It declared that there were special conditions under which certain miners could not earn a reasonable minimum wage, owing to the peculiar nature of the work, and that they should receive such a wage under arrangements suited to special circumstances. It announced its readiness to confer with both parties as to the best means of carrying these principles into effect. The coal owners in the English districts accepted the proposals, but those in Scotland and South Wales rejected them. The miners, while agreeing to the general principle laid down by the government, held to the two essential points, that a concession of the individual minimum wage in each district must precede final settlement of the dispute, and that the minimum wage rates for the various districts must be those adopted by the Miners' Federation at the conference on February 7.

The miners were blamed for refusing to accept the demand of the employers that, if a minimum wage was to be guaranteed, there should be a guarantee of minimum service. Without this, what means, it was asked, would there be for dealing with those who shirked work? The miners were unyielding on this point and the government found it difficult to effect a compromise. The danger of a strike in the coal trade was especially marked in Great Britain, where coal entered so widely into the industrial life of the community that a cessation of the supply would paralyze the factories, railways, and navigation companies and threaten the means of subsistence for the entire population. The strike took place at the time appointed, February 29, and it was estimated that 760,000 men stopped work.

Early in March the miners consented to renew the negotiations, but nothing came of them. By the middle of March the number of miners on strike was placed at nearly 850,000, and of surface workers at over 200,000, while the number of the unemployed in other industries was estimated at between four and five hundred thousand. The figures were not accurate, but rough estimates placed the number of persons thrown out of employment by the strike at up-

wards of a million and a half. Although the strikers had gained the main point, which was the recognition of the principle of the minimum wage, they refused to admit any diminution of the scale of minimum wages that they demanded.

MINIMUM WAGE LAW. Conferences with the miners having proved unavailing, the prime minister introduced a minimum wage bill into Parliament on March 19. Save as regards the application of the minimum wage principle to certain sweated trades (see **MINIMUM WAGE**), such an act was unprecedented in the history of British legislation, and it gave rise to very important discussion. After the final rupture of the negotiations on March 15, the government decided on this measure as the only means of restoring peace. In the speech in which it was introduced the prime minister declared that its prompt enactment was necessary, and that the government had resorted to it only after the hope of a settlement by agreement was destroyed. The government believed that in order to meet the exceptional conditions of work in abnormal places, there must be a minimum wage on the one hand, and a guarantee on the other of adequate service. The measure was characterized as experimental. It was to be in force only for three years. The minimum wage could be recovered by civil process if it were not paid, and it could not be voided by contract. If a workman did not comply with the conditions for the protection of owners against possible abuses, he was to lose the right to the minimum wage. Mr. Bonar Law, among others, criticised the law as likely to prove worse than the evil which it was designed to remove. What was there to prevent, he asked, the precedent of the minimum wage from being extended to other industries? It was virtually inviting every trade that has a strong organization to bring pressure upon the government to attain its object. He did not believe that the guarantees to the masters against diminished output were sufficient. When asked by Labor members what he would do in the present crisis, he replied that three courses had been open to the government. They could have taken steps before the strike to enforce arbitration, or they could have used all the force at their command to protect miners who were willing to continue work after the strike had begun, or they might have insisted that the strike should end and force the owners to open the pits and the men to go back to them. The attitude of the miners toward the bill was distinctly hostile. They demanded that the measure be amended so as to include the schedule rates that they required, and refused to accept any act of Parliament which did not provide for the payment of a minimum wage of not less than 5s. a day for workmen and 2s. a day for boys of fourteen years. The Minimum Wage bill provided for district boards to determine the rates in the different parts of the country. The miners, however, contended for the insertion in the bill of the specific figures, namely, 5s. for men and 2s. for boys as a minimum rate. This the government steadily refused on the ground that the conditions of the industry varied in different districts, and must be specially fixed in each case. The appeal of the prime minister to the miners to come to an agreement with the coal owners was unsuccessful and the bill in Parliament was hurried through its final stage. The

Labor members offered an amendment to meet the demand of the miners providing for the 5s. and 2s. minimum. This amendment was rejected by a vote of 326 to 83, and the bill passed its third reading in the House by 213 votes against 48 on March 27. It went immediately to the House of Lords, where it was passed on March 28, and it received the royal assent on March 29. The discussion of the measure in Parliament brought out a division in the ranks of the Labor party, the Socialists urging that the party should abstain from voting on the third reading while the members that represented the miners wished the party to cast in its vote against it. The argument of the Socialist members was that to cast a vote against a measure embodying, for the first time, the principle of the minimum wage, would embarrass the party in future. The miners carried their point, however, and the Labor party as a whole voted against the measure. The Socialists really saw in the passage of the Minimum Wage measure a triumph for their cause. The European Socialist press expressed its exultation at the result and congratulated the miners on the firm stand that they had taken. M. Jaurès, the French Socialist, and M. Vandervelde, the leader of the Belgian Labor party, pointed to the miners' attitude in this matter as a splendid example. To the great relief of everyone the coal strike was at last declared at an end on April 6, the men having agreed to go back to work while the determination of the Minimum Wage was pending before the district boards. See **MINIMUM WAGE**.

SYNDICALISM. In 1911 and 1912 the term syndicalism, which had hitherto been limited to its continental application, became naturalized in Great Britain. In general, it signifies that element of unionism which aims not merely at organizing strikes for immediate ends, but at organizing a general strike for the purpose of ultimately giving the control of the means of production to the workmen of each trade. Mr. Tom Mann, the labor leader, was arrested on March 19 for having printed in the *Syndicalist* an article urging soldiers to oppose their employment against the workmen in labor troubles, and for having made similar appeals in his speeches. The printers and publishers were also prosecuted. The matter came up in Parliament in the latter part of March in the course of a debate on the Consolidated Fund bill. The attorney-general was criticised for the prosecutions on the ground that they would tend to inflame public opinion. The working classes were already suspicious of the judiciary and it was asked whether one could not question the rightfulness of shooting working people down. In defense of the prosecutions the attorney-general said that they were in no sense an attack on the liberty of the press. If the article in the *Syndicalist* had merely urged that the soldiers should not be called upon to interfere in industrial disputes there would have been no prosecutions, but the article had tried to induce the military to disregard their duty. If soldiers refused to shoot they were liable to the severest punishment, even the death penalty. Hence the gravity of the offense in printing that open letter. The growth of syndicalism in Great Britain was thus disclosed. It was condemned by some as an anti-Social policy, based upon class warfare. At the hearing

early in May Mr. Tom Mann pleaded on his own behalf that he had not attempted to seduce soldiers from lawful commands. He said that when soldiers were acting under civil law they were only citizens. He claimed his right as a man and a citizen to declare that he did not publish the letter, but he did not differ from it and would not ask mercy for his agreement with the principles of the letter. He was pronounced guilty and sentenced to six months' imprisonment, but the sentence was afterwards commuted. See SYNDICALISM.

BUDGET. The budget did not offer any new or remarkable features. No new taxes were to be levied and existing taxation was neither increased nor reduced. The chancellor of the exchequer, Mr. Lloyd-George, in his speech on the presentation of the budget in April, expressed himself in a sanguine manner as to the financial prospects and justified his former predictions. He reminded the House of the four principles that he had laid down in 1909, namely, that the taxes should not only meet the year's requirements, but should be susceptible of expansion to meet further demands; that all classes of the community should contribute; that taxation should not increase the cost of the necessities of life, and that there should be no interference with trade, industry, and commerce. He declared that these principles had been faithfully observed. The estimated expenditure for the coming year was £186,885,000. In view of the effects of the coal miners' strike and the possible needs of naval expenditure, the chancellor declared on this occasion that the surplus amounting to about £6,500,000 could not be turned over to the sinking fund, but in June he announced that £5,000,000 would be applied to the reduction of the debt, £1,000,000 to the supplementary naval estimates, and £500,000 loaned to Uganda and the East Africa Protectorate.

WOMAN SUFFRAGE. It became evident early in the year that the suffrage question would play an important part in political discussion. The growing activities of the suffragists were met by counter-demonstrations from their opponents. The National League, formed to oppose woman suffrage, planned a monster meeting to be held at Albert Hall, February 28. It rapidly gained adherents, including many leading public men and several members of the government. The government had been long divided on the question, some of its prominent members like Mr. Lloyd-George, Sir Edward Grey, and Mr. Winston Churchill having been very active on behalf of the movement. Mr. Asquith's position on the other hand was well known. In the middle of December, 1911, he had told a deputation of suffragists that he believed the granting of the parliamentary franchise to women would be a disastrous political mistake. Lord Curzon and Lord Cromer were among its conspicuous opponents. The proposal to decide the question by referendum was much discussed during the year.

The much-heralded anti-suffrage meeting was held at Albert Hall on February 28. There were said to be 20,000 applications for seats, but the hall could seat only half that number. The meeting was addressed by several persons of prominence and demonstrated the strength of the opposition to the new movement. A few days earlier (February 23) the suffragists held a large meeting at the same place and were ad-

dressed by Mr. Lloyd-George among others. The meeting was interrupted by disorders on the part of the listeners, although Mr. Lloyd-George expressed himself strongly in favor of the suffrage. As to the proposed referendum on the suffrage, he called it a costly denial of justice. He argued that if the course indicated by Mr. Asquith were followed, the triumph of the cause was certain this year. He promised that if the woman suffrage amendment to the Reform bill were carried the government would push the amended bill through this session. On March 1 widespread rioting and window-smashing took place on several of the London streets, where many hundreds of women, armed with hammers, attacked the shops. The prime minister's house in Downing Street was among those damaged. A few days later the same window-smashing tactics were employed at Kensington, Knightsbridge, and Brompton. Hundreds of arrests were made. Many of the arrested suffragists were tried in March. In seventy-six cases the sentence was to hard labor for from four to six months.

The leaders of the suffragist movement, Mrs. Pankhurst and Mr. and Mrs. Pethick Lawrence, who had been arrested on the charge of conspiracy, were found guilty on May 22, after a hearing of six days. The jury, however, recommended mercy in view of the undoubtedly pure motives underlying the woman suffrage agitation. Justice Coleridge sentenced them to imprisonment for nine months, but after a short time they were released. An assault was made on Mr. Asquith while speaking at the Theatre Royal, Dublin, and an attempt was made to burn the building. This led to the arrest and sentence of two woman suffragists who, however, were released on license. Mrs. Pankhurst in October declared that the only way to carry out the purposes of the suffragists was to wage war on property. A Woman Suffrage bill similar to the one defeated in 1911 was introduced in 1912, but met with the same fate. A bill for the abolition of plural voting and containing a woman suffrage provision under restrictions was introduced in July, but did not reach the committee stage. An amendment to the Home Rule bill providing for woman suffrage in the elections to the Irish House of Commons was rejected on November 5.

ELECTORAL REFORM. The government introduced its Franchise and Registration bill on June 17. It provided for the abolishing of plural voting, of property qualification, and of university representation, for the reform of electoral machinery and the system of registration. It made residence or occupation the sole qualification for the suffrage and limited the qualifying period of such residence or occupation to a continuous period of six months. It reached its second reading in July, when the opposition attacked it on the ground that the government itself was not agreed as to the most important principle involved, and that it failed to remedy glaring inequalities in the representative system. It had long been contended by Mr. Asquith and by other members of the government that the question of woman suffrage would be answered in connection with this bill by offering an amendment which should provide for it. The measure as introduced was made to apply to "every male person." In July, after the second reading, several members of the House

gave notice that they would offer amendment to omit the word "male." Nothing further was done with the measure during the session, but it was understood that it was the government's intention to go on with it early in the following year. The principle of proportional representation had gained many advocates in Great Britain in recent years. In 1908 a royal commission was appointed to investigate the various methods in use and its report was published in May, 1910. In 1912 the principle had gained sufficient acceptance to lead to a provision for it in the Home Rule bill in the election of members to the Irish senate. While this bill was under discussion there were vigorous efforts made by many members, both Liberals and Unionists, to extend proportional representation to the elections for the Irish house of commons as well.

MENTAL DEFICIENCY BILL. In the latter part of May Mr. McKenna presented the Mental Deficiency bill in the House of Common. This provided for a central authority of six commissioners to exercise general control over defectives and maintain institutions for such of them as are dangerous and, in general, to perform the same duties in regard to them that are performed by the commissioners of lunacy for the insane. Among its provisions was one that authorized the cessation of the prosecution for a criminal offense when the person accused was found to be feeble-minded. Another important provision forbade the marriage of defective persons.

It was dropped in November in order to give time for carrying through the Home Rule bill, but it was understood that it would be revived at the next session.

WHITE SLAVE TRAFFIC BILL. The Criminal Law Amendment bill, popularly known as the White Slave Traffic bill, provided for the arrest without warrant of anyone committing or attempting to commit the crime of procuring, and empowered the court to impose the punishment of flogging on men convicted of the offense. It passed the House of Commons on November 1. There was strong popular feeling behind the measure and it was supported in Parliament without regard to party lines.

TARIFF REFORM. In 1912 the Unionists continued to give a prominent place in their discussions to the subject of tariff reform. On February 22 a tariff reform amendment to the address from the throne was moved in the House of Commons and was rejected by a vote of 258 to 193. In the arguments on this and other occasions the Unionists laid stress on the point that tariff reform was not a return to the old policy of protection, but was a method of scientifically regulating trade and finance in the interest of the empire as a whole. They urged it as the only rational and practicable method of raising the revenue necessary for social legislation. Their opponents attacked it on the ground that it would raise the cost of production in Great Britain and limit the purchasing power of the population. They were particularly emphatic in denouncing the taxation of food which has formed an essential part of the tariff reform programme ever since Mr. Chamberlain outlined it. In regard to the food duties there was a division of opinion among the Unionists themselves and towards the end of the year it seemed evident that the larger

part of the party were opposed to food duties. The majority of the party also seemed not to be in accord with their leaders on the question of the referendum. Lord Lansdowne in a speech on October 13, 1912, said that the question of tariff reform should be referred to the electorate only if the proposed measure exceeded certain limits which should be specified in advance as to the amount of protective taxation. And on December 15 Mr. Bonar Law in a speech at Ashton-under-Lyne proposed that the question of food duties should be laid before the colonies at an imperial conference, and unless the colonies decided that the food duties were absolutely essential to preference they were not to be imposed. Thus the colonies would decide the question and the proposal would not be submitted to a referendum. This speech aroused considerable opposition among those Unionists who wished for a referendum on the question of tariff reform and who were especially averse to leaving the decision as to the food duties to the colonies. While the majority of the party appeared to differ from Mr. Bonar Law in this matter, there was evidence that all were agreed in their wish that Mr. Bonar Law should retain the leadership.

NATIONAL INSURANCE. The Insurance act, which was passed in 1911, and went into effect on July 15, 1912, was one of the most extensive measures of social legislation passed in recent years. The scheme, as elaborated by Mr. William Lloyd-George, virtually attempted to carry out in a single bill what had been accomplished in the German empire by the legislation of an entire generation. It was very widely discussed in the press at home and abroad. An account of its main features and of the opposition to it will be found in the article **WORKMEN'S INSURANCE**.

NAVAL EXPANSION. While the German naval defense estimates were under discussion in the Reichstag, the British government was watching anxiously the tendency to increase the strength of the German navy. On March 18 Mr. Churchill, the first lord of the admiralty, had introduced his estimates in the House of Commons. He declared that he would adhere to his previous standard, namely, two ships a year for the next six years. This applied the principle that the British navy should be 60 per cent. in excess of the German. In May, when it became evident that the German navy would be increased, the need of supplementary estimates in Great Britain was considered. Italy's course as endangering the Mediterranean equilibrium was the cause of much anxiety (see **TURCO-ITALIAN WAR**). On May 22 Mr. Asquith and Mr. Churchill conferred with Lord Kitchener at Malta concerning the land and sea forces for the Mediterranean. In the latter part of July Mr. Churchill in a speech supporting the new naval estimates made comparisons between German and British naval progress, saying that these supplementary estimates were directly due to the new German navy law which aimed at increasing the striking force of the German fleet. Nearly four-fifths of their vessels would, he said, be ready for instant war. This was the fifth increase of the German navy in fourteen years. Their fleet would ultimately consist of 41 battleships, 20 large armored cruisers, 40 smaller cruisers, and a large force of torpedo-boat destroyers and submarines. The need of

keeping pace with these extraordinary preparations was evident. To maintain the 60 per cent. standard a greater number of ships would have to be built within the next five years than had been estimated. The increase of the Austrian and Italian fleets would require important changes in the Mediterranean. Battleships of the *Invincible* type would replace the British vessels withdrawn and the allied force of British and French vessels in the Mediterranean would be superior to any possible combination. See paragraph above on *Navy*, also articles *NAVAL PROGRESS*, *BATTLESHIPS*, and *FRANCE, History*.

BARON VON BIEBERSTEIN. On May 14 Baron Marschall von Bieberstein (q. v.), whose record as German ambassador at Constantinople was distinguished for its remarkable successes, was appointed ambassador at London to succeed Count Wolff-Metternich. The latter had been recalled in consequence, it was said, of his failure during the Moroccan negotiations of 1911, to keep his home government informed of the actual state of British opinion. In Germany it had been believed that the British government would maintain an attitude of indifference in that affair, and the firm tone of the premier and of Mr. Lloyd-George was as unexpected as it was unwelcome. Baron von Bieberstein's policy at Constantinople had been to treat Old Turks and Young Turks simply as Turks. To his personal qualities, as well as to the lack of any especial ability on the part of his rivals, he owed his conspicuous position among the diplomats at Constantinople. His influence was impaired by the Turco-Italian War, but he had carried out his economic programme, of which the main point was the construction of the Bagdad Railway. Baron von Bieberstein died suddenly at Badenweiler after he had held the new office only three months. He was succeeded by Prince Lichnowsky.

M. SAZONOFF'S VISIT. On September 20 M. Sazonoff, the Russian foreign minister, visited England, and on September 25 entered into conferences with Sir Edward Grey at Balmoral on the various questions of international interest. The chief purpose of the interview was said to be an agreement in regard to Persia. There was much discussion of this matter in the press and the critics of the government's Persian policy feared that it would end in more decisive measures of intervention. From the knowledge that could be gained of the conference it had no such purpose, but on the contrary, aimed to aid Persia in maintaining order with a view to hastening the withdrawal of the foreign troops. The approaching war in the Balkans, however, assumed the chief importance as a topic of discussion. It was announced that both governments were in complete accord in their desire for peace.

LABOR PARTY. The labor party held a conference in Birmingham, on January 25 and 26. Various resolutions were passed condemning the use of military in trade disputes, protesting against the repeal of the Trades Disputes act, welcoming the increasing discontent among workers, and advising trade unions to defy the law on the subject of political utterances until the Osborne judgment should be reversed. The enfranchisement of women was urged and the foreign policy of the country was attacked. A breach between the Liberal and Labor

parties was threatened in June over the refusal of the former to support a Labor candidate in the election at Hanley (see *SOCIALISM*). The Liberal candidate received 6,647, against 5,993 Conservative and only 1894 Labor votes.

MINISTERIAL CHANGES. Early in the year Lord Crewe became lord privy seal, succeeding Lord Carrington, who had resigned. Mr. McKinnon Wood succeeded Lord Pentland as secretary for Scotland. Lord Loreburn on June 4 resigned the office of lord high chancellor and was succeeded by Lord Haldane. Col. J. E. B. Seeley succeeded to the war office, and was in turn succeeded in the office of parliamentary under-secretary by Mr. H. J. Tennant.

MISCELLANEOUS. There was much discussion in the spring of the Malecka case. Miss Kate Malecka, who had been naturalized as a British subject, was arrested while visiting in Warsaw in April, 1912, on the charge of conspiring with Polish Socialists. She denied the charge, and in England public opinion was deeply stirred. Through the influence of the British government the Russian authorities agreed that the trial should be public. It was held in May and she was sentenced to four years' penal servitude, but upon the friendly representations of the British government, the Russian government decided to release her from prison, but to forbid her to remain on Russian soil. A serious colliery accident occurred at the Cadeby coal pit in the Yorkshire mining district on July 9. An explosion early in the morning killed 30 men and later in the day while rescuers were at work a series of explosions followed, killing many more. Reports within the next few days gave the number of deaths as 81. The fifth disaster in the submarine service since 1902 occurred on October 4, when the submarine *B 2* collided with the ocean liner *Amerika* near Dover and sank with all on board. Fifteen perished, including the commanding officer. One officer was saved. The submarine *A 3* was lost with four officers and ten men in a collision with a depot ship off the Isle of Wight on February 2. In June and July, and especially in August, the weather conditions were exceedingly bad. The extraordinary rainfall in August spoiled the harvest in many parts of the country. The city of Norwich suffered particularly. A square mile was under water and the hardships and danger to the people were serious.

For notes of other matters relating to Great Britain, see *ARCHITECTURE*; *ARBITRATION*, *INTERNATIONAL*; *CITY PLANNING*; *CHINA, History*; *DIVORCE*; and *UNEMPLOYMENT*.

GREECE. A constitutional European monarchy, lying between the Ionian and Aegean seas, composed of twenty-six nomes, or departments. Athens is the capital.

AREA AND POPULATION. The area in square kilometers is 64,657 (24,964 square miles); population (1907), 2,631,952. Population of Athens, 167,479. Emigration to the United States (1910-11), 48,000.

INDUSTRIES. Agriculture is the principal industry, though the methods are antiquated; the chief crops are currants, grapes, cereals, tobacco, citrus fruits, olives, and figs. Currant crop (1910-11), 262,500,000 lbs., of which 225,130,412 lbs. were exported. The horses were estimated to number 100,000, cattle 360,000, sheep 2,900,000. Silk culture is carried on. The mineral returns for 1910 are as follows:

608,349 tons iron, 185,207 tons lead, 7000 chromite, 91 copper, 8000 emery, 35,594 manganese iron, 27,557 iron pyrites, 1500 lignite, 48,913 magnesite, 185 nickel, 51,531 sulphur, 37,108 zinc. The sale of salt is put at £118,000. See AGRICULTURE.

COMMERCE, ETC. In the table below is seen the trade for three consecutive years in drachmas (1 dr.=19.3 cents):

	1909	1910	1911
Imports	137,549,244	160,536,471	172,002,000
Exports	101,686,905	144,571,070	140,903,000

The chief imports are grains, textiles, coal, timber, chemical products, fish, etc. The exports for 1910 of the principal products are given below in drachmas with the share of the United Kingdom, France, Germany, and the United States in thousands of drachmas; a few only of the articles are given, and totals for each country named:

Exports	Total	U. K.	Fr.	Ger.	U. S.
Currents	40,523,474	22,497	1,064	5,189	4,876
Wine, etc.	18,633,504	1,525	6,154	3,109	289
Olive oil	17,465,554	316	2,667	62	693
Tobacco leaf. .	12,051,045	90	74	1,595	180
Figs	5,387,184	50	16	322	221
Arg. Lead.	10,110,240	1,292	2,639
Zinc	5,144,776	203	258	642
Hematite	4,296,150	2,823	513	176
Other
Total	144,571,070	33,084	15,468	15,097	10,540

Railways (1912), 1609 kilometers. Previous to the outbreak of the war in 1912, lines from Leontari to Gythion (70 miles) and from Olympia to near Leontari (23 miles) were under construction. The Gravia to Volo line to the Gulf of Corinth was also under way.

FINANCE. The total revenue for the year 1911 amounted to 136,277,463 drachmas, and the expenditure to 135,094,473. The budget for 1912 estimated the revenue at 144,118,645 drachmas and the expenditure at 143,326,520. The gold debt amounted, December 31, 1912, to 833,581,000 and the paper to 150,009,565 drachmas.

ARMY. The reorganization of the army which had been in progress in 1911, under the direction of General Eydoux, the French military adviser of the government, found opportunity for test in the Balkan War. On February 15, 1912, the military scheme as arranged by him was voted, and this provided for the composition of the Greek army on a war-footing as follows: 44 regular infantry battalions (36 line and 8 chasseurs) and 36 reserve battalions; 46 field and 3 heavy batteries of artillery; 16 squadrons of cavalry and 84 machine guns; affording a maximum effective of 100,500 men (80,000 rifles, 1760 sabres, and 173 guns) to which might be added 16 companies of gendarmes (147 officers, 3882 men, and 387 horses). The national guard, consisting of men between the ages of 40 and 53, amounted to about 69,000 men.

The new law required military service from the end of the 19th year and permitted no exceptions. In addition to the main army a first reserve consisting of 14 classes and designed ultimately to furnish some 200,000 men was provided for, while a second reserve and the territorial army were to give 250,000 men. Un-

der the new law terms of service were as follows: With the active army 2 years; with the first reserve 12 years; with the second reserve 9 years; with the territorial army 7 years; with the territorial reserve 7 years. The new organization was not completed at the outbreak of the war, but was in active progress and the artillery was being re-armed with Schneider-Canet quick-firing guns. The new regulations provided for an active army with a peace strength of 29,000 men, which in time of war could be increased to from 120,000 to 130,000, but in 1912 officers were not available for such a force. The 4 divisions had their headquarters at Larissa, Athens, Missolonghi and Nauplia. How well the mobilization on the outbreak of war was effected and the performance of the Greek troops in the field, will be found discussed under MILITARY PROGRESS and TURKEY AND THE BALKAN PEOPLES.

NAVY. The navy includes one Italian-built armored cruiser (*Georgios Averoff*, 10,000 tons), 3 coast-defense vessels (4800 tons each), 12 modern destroyers and torpedo boats, and some small craft. Personnel, 4941.

GOVERNMENT. The executive authority is vested in a king (1912, George I.), assisted by a responsible ministry of seven members. The legislative body consists of a single chamber of 207 members, elected by manhood suffrage. The reigning king (son of Christian IX. of Denmark) was elected king by the Greek national assembly in 1863. The ministry in 1912 was composed as follows: E. Venezelos, premier and minister of war; A. Coromilas, foreign affairs; K. Raktiván, justice; E. Repoulis, interior; I. D. Tairimokos, worship and instruction; A. N. Diomidis, finance; N. Stratos, marine, A. Michalacopoulos, national economics.

HISTORY. The chief events of 1912 had to do with the relations with Crete and the part played by Greece in the Balkan War, and an account of them will be found in the articles CRETE, *History*, and TURKEY AND THE BALKAN PEOPLES. On January 2 the Revisionary Chamber having finished its work was dissolved, the dissolution being hastened in order that the Cretan deputies detained on the warships of the protecting powers might be set free (see CRETE). The elections, which took place in the latter part of March, resulted, despite the bitter opposition of the old parties to the premier, M. Venezelos, in the return of a large majority in his favor. Out of the 181 deputies to the new chamber, 147 were supporters of the new premier. There were some changes in the cabinet in May, the chief of which was the resignation of M. Guyparis, minister of foreign affairs, who was succeeded by M. Koromilas. The meeting of the chamber, fixed for May 4, was postponed to June 2, and on that day after the deputies were sworn it was prorogued till October. In the latter month all interest centred in the mobilization of the Greek forces, preparatory to the Balkan War. The part taken by M. Venezelos, both in the difficult question of Crete and in the events preceding the war, added greatly to his repute for statesmanship. He was credited with being the guiding spirit of the Balkan alliance. On April 8 the anniversary of the declaration of Greek independence was celebrated with a grand review of troops before the statue of Byron. In April, also, other

celebrations were held in commemoration of the founding of the University of Athens, and the Congress of Orientalists held its sixteenth session. King George attended the funeral of King Frederick of Denmark in May, and was again absent in August and September, taking the cure at Aix-les-Bains. During his absence on this occasion the crown prince acted as regent.

GREEK ARCHÆOLOGICAL SOCIETY.

See ARCHÆOLOGY.

GREENLAND. A Danish Arctic colony. Estimated area, 2,200,000 square kilometers (849,420 square miles). Area of settlements (colony proper), 88,100 square kilometers (34,015 square miles). Population of colony proper in 1901, 11,893 (11,821 Eskimos and 272 Europeans); February 1, 1911, 12,968. The director (residing at Copenhagen) was I. Daugaard-Jensen in 1912.

GREENOUGH, GEORGE GORDON. An American soldier and scholar, died June 28, 1912. He was born in Washington in 1844, and was educated in private schools in Paris and in Baltimore. He graduated from the United States Military Academy in 1865 and in the same year was appointed first lieutenant in the 12th Infantry. In the following year he was transferred to the 21st Infantry, and in 1870 was assigned to the 4th Artillery. He was made a captain in 1893, major in 1898, colonel in 1903, and brigadier-general and retired in 1908. From 1868 to 1873 he was assistant professor and acting professor in French at the United States Military Academy. He served in several Indian campaigns in 1873, 1875, and 1876-77. He was one of the pioneers in range-finding work from 1892 to 1898. In the latter year he commanded the artillery defenses at Washington. He served in Cuba in the Spanish-American War, and in the Philippine Islands. He was the inventor of various devices for artillery operations.

GRENADA. The largest of the British Windward Islands colonies. Area, 133 square miles, population (1911), 66,750. Capital, St. George's (4916 inhabitants in 1911). Cacao is the most important product, the export in 1910 being valued at £259,385. Total exports (including spices) in 1910, £291,760; imports, £279,368. Revenue (1910-11), £81,413; expenditure, £75,561. Sir James Hayes Sadler, governor (1912). Attached to Grenada are some of the Grenadine Islands.

GRENADINE ISLANDS. Dependency of Grenada (q. v.).

GRIFFEN, WALTER BURLEY See CITY PLANNING, *Australian Capital*.

GRISCOM, CLEMENT ACTON. An American financier, died November 10, 1912. He was born at Philadelphia in 1841 and received an academic education. In 1857 he became clerk and, in 1863, partner in the business house of Peter Wright and Sons, shipping merchants. Soon after he had become partner in this firm he conceived the idea that the export of petroleum offered great possibilities. He was a pioneer in this trade, which was later developed by the Standard Oil Company. In 1871 he began the operation of the American line of steamships which was at that time the only line that carried the American flag in the North Atlantic Ocean. His chief ambition was to bring together under one management the greatest steamship combination in the world, and he organized the International Navigation

Company, of which he was successively vice-president and president. In 1902, with the coöperation of J. Pierpont Morgan, he merged this company with the International Mercantile Marine Company, comprising the White Star, Atlantic Transport, Dominion, and Leyland lines. He was president of this company until his retirement in 1904. For forty years, almost unaided, Mr. Griscom kept the American flag in the North Atlantic Ocean and retained the interest of capital in American shipping. During these forty years his company never lost a ship, passenger, or mail bag. Although he retired from the presidency of the International Mercantile Marine Company in 1904, he accepted the chairmanship of the board of directors, remaining in active business until 1908. In addition to his shipping interests he was director and official in many important corporations, including the Pennsylvania Railroad Company and the United States Steel Corporation. For his work in the direction of safety in the construction of ships he was made an honorary member of the British Institute of Naval Architects and was at one time president of the American Society of Naval Architects.

GRISWOLD, STEPHEN BENHAM. An American librarian, died May 4, 1912. He was born at Vernon, N. Y., in 1835, and received an academic education. After studying law at the Albany Law School he was admitted to the bar in 1860. From 1868 to 1904 he was librarian of the New York City Library and from 1899 until the time of his death was a member of the faculty of the Albany Law School.

GROSSMITH, GEORGE. An English actor and entertainer, died March 1, 1912. He was born in 1847, the son of George Grossmith, a well-known journalist, lecturer, and entertainer. After studying in the North London Collegiate School he assisted his father in various fields of work. He was for a time reporter for the *Times*. He later assisted his father in miscellaneous entertainments of lecturing, reciting, imitating, etc. In the meantime he was engaged in the study of music. In 1877 he first went on the stage and joined an enterprise which was to develop into the great Gilbert and Sullivan opera. His first appearance was in *The Sorcerer*, produced in that year. For the next twelve years he was identified almost entirely with the Gilbert and Sullivan operas, although for a short time during that period he returned to entertaining. Among his best-known parts were those of "Sir Joseph Porter" in *Pinafore*, "Bunthorne" in *Patience*, the "Lord Chancellor" in *Iolanthe*, and "Ko-ko" in *The Mikado*. In 1889 he was obliged to retire from opera singing and return to entertaining along new lines. These included talking, singing and playing the piano. The entertainments were at that time unique and were very successful. He became no less popular in America and Canada than in the United Kingdom. All his songs, piano music, and humorous talks were of his own composition. Among the best-known of his songs are *The Happy Fatherland*, *The Polka and the Choir-Boy*, and *We Left the Baby on the Shore*. His talks abounded in wit and humorous satire. He composed two operas, *Cups and Saucers* and *Uncle Samuel*, and was the author and composer of over six hundred humorous and satirical songs and sketches.

GUADELOUPE. A French colony composed of islands of the Lesser Antilles. Area, 1780 square kilometers; population (1911), 212,430. Imports (1910), 16,804,000 francs; exports (sugar, cacao, coffee, tobacco, and tropical fruits), 24,053,000. The local budget balanced for 1912 at 4,559,583 francs. M. Peuvigne was governor in 1912.

GUAM. See AGRICULTURAL EXPERIMENT STATIONS.

GUANTANAMO, CUBA. See UNITED STATES, Army.

GUATEMALA. A Central American republic. Capital, Guatemala City.

AREA, POPULATION, ETC. One estimate of the country's area is 48,290 square miles; another, 43,641. The area cannot be definitely determined until the boundary dispute with Honduras is settled. On December 8, 1911, the boundary convention between the two countries, which would expire March 1, 1912, was extended for two years from the latter date. The census of December 31, 1903, disclosed a population of 1,842,134, about 60 per cent. Indian and most of the remainder mestizo. The vital statistics indicate that the population in 1912 had increased to over 2,000,000. Births in 1910, 74,498; deaths, 35,077; in 1911, 71,895 and 35,234. The larger towns, with estimated population, are: Guatemala City, 125,000; Quezaltenango, 34,000; Cobán, 31,000; Totonicapán, 29,000; Escuintla, Chiquimula, Zacapa, Jalapa, each 18,000; Santa Cruz del Quiche, 17,000; Jutiapa, 16,000; Antigua, Salama, and Huehuetenango, each 15,000; Amatitlán, 12,000; Sololá, 11,000.

Public primary schools in 1911 numbered 1821, with 55,685 pupils enrolled; there were 1657 students in secondary and normal schools. There are several institutions for professional and special instruction.

PRODUCTION AND COMMERCE. The principal crops are coffee, corn, sugar-cane, bananas, tobacco, and cacao. In 1911 about 880,000 acres were under coffee. There is some exploitation of cabinet woods, rubber, and chicle. Mining and manufacturing are unimportant.

Imports and exports have been valued as follows:

	1908	1909	1911
Imports	\$5,811,586	\$ 5,251,317	\$ 6,514,421
Exports	6,756,138	10,079,219	10,981,724

Leading imports in 1911: Cotton goods, \$1,848,651; woolens, \$277,600; silks, \$267,279; linen, hemp, jute, \$272,267; iron and steel manufactures, \$626,425; wheat flour, \$354,155; other food products, \$419,818; wines and liquors, \$223,286; railway material, \$311,385; agricultural and industrial machinery, \$196,422; drugs and medicines, \$217,635. Principal exports in 1911: Coffee, clean, 30,345 short tons, \$7,282,749; coffee in parchment, 10,480 tons, \$1,991,161; bananas, \$526,711; sugar, \$344,015; hides, \$325,261; rubber, \$159,621; woods, \$158,178; chicle, \$150,902. The United States sent imports and received exports in 1911 valued at \$2,696,144 and \$3,297,156 respectively; Germany, \$1,592,658 and \$5,851,817; United Kingdom, \$1,314,202 and \$1,324,721; France, \$286,050 and \$19,333. Of the exports to Germany, coffee amounted to \$5,457,462. Entered at the ports in 1911, 623 steam-

ers, of 1,187,800 tons, and 8 sail, of 257 tons.

COMMUNICATIONS. Railways in operation at the end of 1911 totalled 679 kilometers (422 miles). San José and Champerico, on the Pacific, are connected with Guatemala City and other towns, the lines aggregating 189 miles. From the capital a line extends to Puerto Barrios, on the eastern coast, 195 miles. During 1911 1,187,433 passengers and 252,882 tons of freight were carried; of the freight, 149,438 tons represented local freight, and 103,449 tons the freight made up of import and export. Telegraph lines, over 4200 miles; offices, 221. Post offices, 311.

FINANCE. Revenue and expenditure for fiscal years, in thousands of pesos paper:

	1906	1907	1908	1909	1910	1911
Rev.	30,501	35,298	37,336	49,240	51,571	62,047
Exp.	45,733	44,560	49,930	70,564	45,959	69,162

The approximate average value of the paper peso was 9 cents in 1906, 8 in 1907, 6½ in 1908, 6 in 1909, 7 in 1910, and 5½ in 1911. Over one-half of the revenue is derived from customs, and one-third from spirits, tobacco, etc. The budget for the fiscal year 1912 showed estimated expenditure of 37,417,217 pesos; 1913, 43,020,333 (22,000,000 for the debt; war, 5,267,268; 4,724,170 interior and justice; 3,199,035 public instruction). Debt, December 31, 1910, foreign \$13,694,446 and £1,482,800, with arrears of interest £711,747; interior, 71,884,745 pesos paper.

GOVERNMENT. The president is elected by direct vote for six years and is assisted by a cabinet of six members. The legislative body is the unicameral National Assembly (69 members). The president in 1912 was Manuel Estrada Cabrera, who succeeded to the executive office in March, 1898, and subsequently was elected for terms ending March 15, 1905, 1911, and 1917.

GUGGENHEIM, BENJAMIN. An American capitalist, died at sea April 15, 1912. He was born in 1855, one of the seven sons of Meyer Guggenheim, founder of the firm of M. Guggenheim and Sons. All these sons became famous for their mining interests in many parts of the world. When twenty years of age Benjamin Guggenheim was sent by his father to Denver, Col., to take charge of some mining interests in that city. He foresaw the importance of the smelting industry and had charge of the first smelter built by the family at Pueblo, Col. He subsequently returned to the East and took charge of the smelting plant at Perth Amboy, N. J. In 1903 he erected a large plant at Milwaukee for making machinery, which became merged in the International Steam Pump Company, of which Mr. Guggenheim was elected president in 1909. With his brothers he was the ruling factor in the American Smelting and Refining Company. Mr. Guggenheim was one of the victims of the *Titanic* disaster.

GUIANA. See BRITISH GUIANA; DUTCH GUIANA; FRENCH GUIANA.

GULF OIL FIELD. See PETROLEUM.

GUN MOUNTS. See NAVAL PROGRESS, *General Progress, United States.*

GUN RUNNING. See PERSIA.

GYMNASTICS. The fourteenth annual intercollegiate gymnastic meet was won by Yale. This marked Yale's third successive victory.

Pennsylvania finished second and Princeton third. The team scores follow: Yale 24, Pennsylvania 17, Princeton 8½, Rutgers 8, New York University 4, Haverford 1, Illinois ½. The all-round championship was won by F. Callahan of Yale, who also was the victor in 1911. In dual college meets, Yale defeated Pennsylvania 28-26 and Princeton 27-26; U. S. Naval Academy defeated Princeton 25-20, Columbia 28-17, Pennsylvania 31-23, and Yale 32-22; Pennsylvania defeated Columbia 45-12, Haverford 32-22, Lehigh 44-10, and Princeton 31-23; New York University defeated Rutgers 34½-14½, and Columbia 35-16.

The club championship of the Amateur Athletic Union was won by the New York Turn Verein, which scored 24 points. The West Side Y. M. C. A., winner in 1911, was second with 13 points, and the Pittsburgh A. A. third with 11 points. Paul Krimmel, of the New York Turn Verein, for the second year in succession captured the all-round championship. The English individual championships were won by E. W. Potts of the Northampton Institute.

GYNOVAL. A colorless neutral fluid of a peculiar odor and mild oleaginous taste, having the chemical formula $\text{CH}_3\text{CH}(\text{CH}_3)\text{CH}_2\text{COO.C}_6\text{H}_{11}$. It is nearly insoluble in water, but easily dissolves in alcohol, ether, chloroform, benzol, and petroleum-benzin. It is stated to have a boiling point of 132° to 138° C., under 12 mm. pressure, and a specific gravity of 0.952 to 0.957 at 15° C.

The therapeutic action of gynoval is said to be that of a mild nervine and antispasmodic, resembling that of valerian, with the advantages of a much more agreeable odor and of being better tolerated, especially in not giving rise to unpleasant eructations. Like other valerian preparations, it is indicated in nervous headaches, nervous insomnia, nervous disorders of the climacteric, hysteria, cardiac and gastric neuroses, and neurasthenia.

HADLEY, H. S. See **PRESIDENTIAL CAMPAIGN** and **MISSOURI**.

HAGUE TRIBUNAL. See **ARBITRATION**, **INTERNATIONAL**.

HAHNKE, WILHELM VON. A German soldier, died February 8, 1912. He was born in Berlin in 1833 and received his military training as a member of the Prussian cadet corps. He entered the Prussian army in 1851 and in 1866 was on the staff of the Crown Prince, Frederick William, during the campaign in Bohemia. During the Franco-German War he was a major on the general staff in the headquarters of the crown prince. He was appointed major-general in 1881 and was given command of the first brigade of infantry guards. In 1890 he became general of infantry and from 1888 to 1901 was chief of the military cabinet. In 1899 he was appointed commander-in-chief of the Marches and governor of Berlin. He was made general field marshal in 1903.

HAINES, HENRY WILLIAMSON. An American archaeologist, died February 16, 1912. He was born in Bangor, Me., in 1831, and graduated from Harvard College in 1851. He engaged in teaching for several years, after which he was admitted to the bar and for a short time practiced law. He was professor of Latin and later of Greek in the University of Vermont from 1867 to 1872. From 1873 he devoted his attention entirely to archaeological

research, making investigations in Europe, Egypt, and elsewhere. He received a medal and diploma from the International Congress of Anthropological Sciences, Paris, 1878. He was a member of several learned societies and was corresponding secretary to the Massachusetts Historical Society. He contributed articles on archaeological subjects for scientific journals.

HAITI. A republic occupying the western part of the West Indian island of Haiti. The capital is Port-au-Prince.

AREA, POPULATION, ETC. The area is estimated at 28,676 square kilometers (11,072 square miles). Another estimate is 10,204 square miles. The number of inhabitants cannot be told with certainty. It was estimated in 1887 at 960,000; a recent estimate, based on parish registers, places it at about 2,030,000, while the figure given by the 1912 French *Annuaire Statistique* is 1,500,000 and another estimate of 1912 2,500,000. Probably nine-tenths of the people are negroes, and most of the remainder mulattoes. The principal towns include: Port-au-Prince, with perhaps 100,000 inhabitants; Cap Haïtien, 30,000; Les Cayes, 25,000; Gonaïves, 18,000. The educational system is very imperfect. There are some 400 national schools, a few private schools, and five lycées.

PRODUCTION AND COMMERCE. The leading product is coffee; other crops of some importance are sugar-cane, cacao, cotton, and tobacco. Logwood and other valuable forest products are cut for export. Mining is almost entirely undeveloped. The following statistics of production, doubtless imperfect, are reported for the year 1910-11: Coffee, 53,129,824 lbs.; cacao, 3,304,086 lbs.; logwood, 76,354,731 lbs.; roots, 8,916,800 lbs.; cotton, 5,256,573 lbs.; Dutiable imports and exports were reported at \$5,880,676 and \$3,479,848 for the fiscal year 1909; for the calendar year 1910, dutiable imports \$7,681,746, and total exports \$15,475,331. Two-thirds of the imports are from the United States, and the greater part of the exports goes to France. Weight in thousands of pounds of the chief exports in the year 1909-10: Logwood, 75,197; coffee, 51,104; cotton seed, 8058; cotton, 4198; cacao, 3228; hides, 346.

COMMUNICATIONS. There were about 64 miles of railway in 1910. In August of that year the government contracted for the construction of a system of 321 miles, and work was begun in 1911. The first section, from Cap Haïtien to La Grande Rivière, was finished in 1912, and before the end of the year the section from Gonaïves to Ennery was almost finished. Telegraph line (1910), 124 miles. There are reported 31 post offices.

FINANCE. Estimated revenue for the fiscal year 1911, \$3,279,059 and 7,866,092 gourdes; estimated expenditure, \$3,279,059 and 7,858,560 gourdes. The estimated revenue for 1911-12 was reported at \$3,957,227 and 8,227,315 gourdes. The paper gourde fluctuates, but averages about 20 cents in value. Revenue is derived chiefly from import and export duties, and the largest item of expenditure is service of the debt. On March 31, 1911, the debt, including arrears, amounted to \$26,349,510 and 10,384,300 gourdes.

GOVERNMENT. According to the constitution, the president is elected for seven years by the two chambers of the congress in joint session.

His cabinet consists of six members. The Senate consists of 39 members elected indirectly, and the Chamber of the Communes of 96 members elected by popular vote. Gen. Antoine Simon was elected president December 17, 1908, after the deposition of Gen. Nord Alexis, Simon was deposed upon the successful revolution of 1911, headed by Gen. Cincinnatus Leconte, who was elected to the presidency on August 16 as from May 15, for seven years. On August 8, 1912, General Leconte lost his life in a fire which destroyed the executive residence. His successor was chosen in the person of Gen. Tancède Auguste, for a term ending May 15, 1919. See ARBITRATION, INTERNATIONAL.

HALL, EDWARD HENRY. An American Unitarian clergyman and writer, died February 22, 1912. He was born in Cincinnati in 1831 and graduated from Harvard College in 1851. He studied theology at the Harvard Divinity School, graduating in 1855. In 1859 he was ordained to the Unitarian ministry. During the Civil War he was chaplain of the Massachusetts volunteers. He served as pastor in Plymouth, Mass., in Worcester, and in Cambridge. He was a fellow of the American Academy of Arts and Sciences, and was a member of the Massachusetts Historical Society. Among his published writings are *Orthodoxy and Heresy in the Christian Church* (1874); *Lectures on the Life of St. Paul* (1885); *Discourses* (1893); *Papias and His Contemporaries* (1899), and *Paul the Apostle* (1906).

HAMILTON COLLEGE. An institution of higher learning at Clinton, N. Y., founded in 1812. The total enrollment in the various departments of the college in the autumn of 1912 was 185. The faculty numbered 20. There were added during the year new professors of English literature and of gymnastics and hygiene. The most notable benefaction was one of \$100,000 for the new library building. The amount of productive funds was about \$1,000,000 and the annual income about \$75,000. The volumes in the library numbered 54,000. The college celebrated in 1912 its one hundredth anniversary with appropriate ceremonies. (See UNIVERSITIES AND COLLEGES.) President, M. W. Stryker, D. D., LL. D.

HAMMOND, JOSEPH. An English clergyman and writer, died May, 1912. He was born in 1839 and was educated at King's College, London. He served as curate and vicar of several churches in England. From 1892 to 1902 he was canon of Truro. He was chiefly known for his theological writings, principally on points of difference between the Anglicans and Nonconformists. He was also well known as a preacher. Among his published writings are *English Nonconformity and Christ's Christianity* (1893); *Seal and Sacrament* (1892); *Concerning the Church* (1896); *A Cornish Parish* (1897), and *Magister Moritur* (1910).

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. An institution for the education of negroes at Hampton, Va., founded in 1868. The total number of students enrolled in the various departments of the institute in 1912 was 1356. The faculty numbered about 200, including instructors and employees. There were no notable changes in the faculty during the year, and no important bene-

factions. The productive funds of the institute amount to \$2,570,000. There are 30,703 volumes in the library. President, H. B. Frissell, D. D.

HANSCOM, JOHN FORSYTH. A rear-admiral, retired, of the United States navy, died September 30, 1912. He was born in Eliot, Me., in 1842, and at 16 years of age enlisted in the 62d Maine Volunteers, serving throughout the Civil War. He was then appointed draughtsman at the Norfolk Navy Yard and was later transferred to Washington and to the Boston Navy Yard in 1871. He received a commission as assistant naval constructor in 1875, serving at Chester and League Island. At the latter post he supervised the construction of the *Dolphin* and *Chicago*, and also had much to do with the construction of battleships, including the *Baltimore*, *New York*, *Columbia*, *Massachusetts*, and *Indiana*. After serving two terms on the board of inspection and survey he was on active sea service until 1903, when he was detached and appointed senior of the board of award. He was placed on the retired list with the rank of rear-admiral in 1904, but continued to act as the active head of the board of hull changes until August, 1911. He was one of the most eminent authorities in the navy on naval construction.

HANSEN, GERHARD HENRIK ARMAUER. A Norwegian biologist and physician, died May, 1912. He was born at Bergen in 1841. His early education was received in the cathedral schools of his native city. He studied medicine and became resident physician in Riga hospital at Christiania. He later spent several years as medical officer at the Lofoten fisheries. In 1868 he was appointed assistant medical officer to the Bergen Leper Hospital, of which Danielsen was director. Under the influence of the latter, Hansen began the study of leprosy, which he continued throughout his life. His first investigation was to work out the significance of the "leper cells" of Virchow. He prosecuted his studies in various universities and then returned to Norway to resume his investigations of leprosy. These investigations pointed to the contagious and specific nature of the disease, and in recognition of the value of his work the Medical Society of Christiania voted a sum of money to enable him to continue his studies. In the course of journeys made about the country he came across cases of leprosy which were explainable only by the theory of contagion. The conclusions at which he thus arrived conformed with those of Dognat-Landré, who had studied leprosy in Surinam and had published the results of his researches. Continuing his labors, Hansen was rewarded by the discovery of a bacillus in unstained preparations. Later the microorganism was stained and became known as Hansen's bacillus. This was in 1873. In the years following he endeavored to cultivate and inoculate the leprosy bacillus, but his efforts were unsuccessful. Measures taken as a result of his work, however, have effected a marked diminution of the disease throughout Norway.

HARAHAN, JAMES THEODORE. An American railway official, killed in a railroad wreck on January 22, 1912. He was born in Lowell, Mass., in 1843, and was educated in the public schools. He began his railroad career as a switchman in 1864. He rose through various grades of promotion on different railways until in 1883 he became general superintendent of

the Louisville and Nashville Railroad. Two years later he was appointed general manager of this line. In 1885 he went to the Baltimore and Ohio Railroad as superintendent of the Pittsburgh division, but returned to the Louisville and Nashville in the same year as assistant general manager. In 1888 he was appointed assistant general manager of the Lake Shore and Michigan Southern, and in 1890 was elected second vice-president of the Illinois Central, which was then controlled by Stuyvesant Fish. As a result of the famous struggle between E. H. Harriman and Stuyvesant Fish for the control of the Illinois Central, in which Harriman was successful, Mr. Harahan became president of this line, as the representative of Harriman.

HARMON, JUDSON. See PRESIDENTIAL CAMPAIGN and OHIO.

HARRIMAN, E. H. See PRESIDENTIAL CAMPAIGN CONTRIBUTIONS.

HARRITY, WILLIAM FRANCIS. An American lawyer and public official, died April 17, 1912. He was born in Wilmington, Del., in 1850, and graduated from La Salle College in 1870. For a time he taught mathematics and Latin in that institution. He was admitted to the bar in 1873 in Philadelphia and practiced law in that city. He took an active interest in politics and was delegate-at-large to the Democratic national conventions of 1884 and 1896. In the latter year he received twenty-one votes for the vice-presidency. He was chairman of the Democratic national committee from 1892 to 1896. From 1885 to 1889 he was postmaster at Philadelphia, and from 1891 to 1895 was secretary of state of Pennsylvania. He was an officer and director in many important financial enterprises and institutions.

HARROD, BENJAMIN MORGAN. An American engineer, died September 7, 1912. He was born in New Orleans in 1837 and graduated from Harvard College in 1856. He served in the Confederate army as lieutenant of artillery and as captain in the engineer corps. From 1877 to 1880 he was chief State engineer of Louisiana and from 1879 to 1904 was a member of the United States Mississippi River Commission. He was city engineer of New Orleans from 1888 to 1892 and was chief engineer in charge of constructing the drainage system of that city from 1895 to 1902. From 1904 to 1907 he was a member of the Panama Canal Commission.

HARTFORD, CONN. See CITY PLANNING.

HARTLEY, JONATHAN SCOTT. An American sculptor, died December 6, 1912. He was born at Albany, N. Y., in 1845, and received his education at the Albany Academy. He took his first lessons on art in that city under E. D. Palmer. He later studied in England, where he took a medal at the Royal Academy. He later spent some time in Germany, Paris, and Rome. He made many busts of actors and actresses, including Edwin Thomas Booth, Lawrence Barrett, John Gilbert, and Ada Rehan. Among his other well-known works are the "Daguerre Monument" in Washington, the "Ericsson Monument" in New York City, the "Statue of Miles Morgan" in Springfield, Mass.; the "Statue of Alfred the Great" for the Appellate Court Building, New York City, and the "Statue of Thomas K. Beecher" in

Elmira, N. Y. He also designed many other public works. His last exhibited work was a group, a boy and rabbits, called "The Cradle of Pan." Mr. Hartley was president of the Art Students' League from 1878 to 1880 and of the National Academy in 1891. He was one of the founders of the Salmagundi Club, of which he was president from 1903 to 1906.

HARVARD UNIVERSITY. The total enrollment in the university in the autumn of 1912 was 5224, which includes those in the university extension courses. The students were divided among the different departments as follows: College, 2308; graduate school of arts and science, 463; graduate school of applied science, 132; graduate school of business administration, 107; divinity school, 48; law school, 741; medical school, 290; dental school, 190. The extension students numbered 9, and those in the summer schools of 1912 numbered 1187. The officers of instruction and administration numbered 774. Of these 137 were professors, 5 associate professors, 83 assistant professors, 73 lecturers, 217 instructors, 29 Austin teaching fellows, 32 teaching fellows and fellows for research and 212 administrators and assistants. For gifts and bequests received during the year see GIFTS and BEQUESTS, and for other items of interest, see UNIVERSITIES and COLLEGES.

HARTWELL, ALFRED STEDMAN. An American jurist, died August 30, 1912. He was born in Dedham, Mass., in 1836, and graduated from Harvard College in 1858. He served throughout the Civil War, receiving the brevet rank of brigadier-general of volunteers for gallantry at the battle of Honey Hill, S. C. In 1867 he was elected a member of the Massachusetts legislature and in the following year was appointed first associate justice of the Hawaiian Islands, serving until 1874, when he was elected attorney-general of the Hawaiian Islands. He was again elected to this office in 1877. In 1889-1900 he was special agent of the Republic of Hawaii. He was appointed associate justice of the Supreme Court of Hawaii in 1904 and was chief justice from 1907 to February 2, 1911, when he resigned.

HATCHER, WILLIAM E. An American Baptist clergyman, died August 24, 1912. He was born in Bedford County, Va., in 1834, and graduated from Richmond College in 1858. From 1875 to 1901 he was president of the Baptist education board of Virginia, and from 1891 to the time of his death was head of the Baptist Orphanage of Virginia. He was editor of the *Religious Herald*, the *Baltimore Baptist*, and the *Baptist Argus*. He wrote, jointly, *Life of Rev. A. B. Brown, LL.D.* (1885), and *Life of Rev. J. R. Jeter, D.D.* (1899). He wrote also *The Pastor and the Sunday School* (1902); *John Jasper* (1908), and *Along the Trail of the Friendly Years* (1910).

HAUK-WARTEGG, MINNIE. An American prima donna, died November 16, 1912. She was born in New York City in 1852. Her first appearance as a singer was made in 1865 in New Orleans, to which city her parents removed soon after she was born. Three years later she returned to New York and obtained a position as choir singer, while still continuing her studies. She made her first appearance in opera in Brooklyn, singing the part of "Norma." She later appeared in the Academy of Music in New York City and her suc-

cess from that time was assured. She soon went to London and sang at the Covent Garden, where she was received with great enthusiasm. In 1870 she became the leading soprano of the Imperial Opera House in Vienna, remaining for three years. At the end of that time she went in the same capacity to the Royal Opera House in Berlin. She created the first "Carmen" heard in London and New York, and for many years she was the tradition accepted by all as to the finest embodiment of that heroine.

HAUPTMANN, GERHART. See GERMAN LITERATURE, and NOBEL PRIZE.

HAWAII. POPULATION. The population of the Territory according to the census of 1910, was 191,909, divided as follows: Japanese, 79,674; Hawaiian, 26,041; Portuguese, 22,303; Chinese, 21,674; part Hawaiian 12,506; Porto Rican, 4890; Spanish, 1990; other Caucasian, 14,867; all others, including Koreans, mulattoes, negroes, and Filipinos, 7964. Of the total population, 98,157 were native born, that is, born within the United States or its possessions. By sex, 123,099 were males, and 68,810 were females. The population increased in the decade 1900-10 37,908. The population of the several islands in 1910 was as follows: Oahu, 81,993; Hawaii, 55,382; Maui, 28,623; Kauai, 23,744; Molokai, 1791; Lanai 131; Niihau, 208; Kahoolawe, 2.

IMMIGRATION. Immigration is divided into two classes, unassisted and assisted. The assisted immigration includes that induced to come to the Territory by the department of immigration and labor, and by the Hawaiian Sugar Planters' Association. Unassisted immigration includes that of Americans from the mainland of the United States. There are no accurate statistics as to the number of these, but in recent years there have been many purchases of resident lands, erection of dwelling houses, and taking up of homesteads, which indicates a comparatively large unassisted immigration. The feature of most general interest relating to unassisted immigration is that of the Japanese element in the population. For some years after annexation the arrivals of Japanese in the islands greatly exceeded the departures, but for some years now the departures have exceeded the arrivals. What increase there is among the Japanese occurs through the excess of births over deaths within the Territory. Unassisted immigration in the fiscal year 1910 included 5632 men, 2892 women, and 1313 children. The greater number of these came from Oriental countries, chiefly China, Japan, and the Philippine Islands. The departures included 3712 men, 1770 women, and 1474 children. The check in Japanese immigration is the result of an understanding between the government of the United States and Japan on the subject of the immigration of Japanese labor. The problem of securing labor is a serious one in the Territory and efforts have been made to obtain laborers from European countries, especially from Portugal and Spain, and Russians from Manchuria and Siberia. During the last five years 12,306 laborers from these countries have been induced to come to Hawaii. During 1912 the introduction of Russians from Manchuria was discontinued because of difficulties in introducing them.

AGRICULTURE. The chief industries of the islands are agricultural. Of these the most important are the sugar- and fruit-raising indus-

tries. The sugar industry outdoes all others combined. The crop of the fiscal year 1912 was 595,258 short tons, compared with 566,821 short tons for the preceding year. The crop for the fiscal year 1912-13 may be slightly smaller because of unfavorable weather conditions. Of the lesser industries that of pineapples has now reached first place and is growing rapidly. The output for 1912 is estimated at about 1,000,000 cases of two dozen cans each, besides which more or less of the fresh fruit is exported as well as juice prepared for various purposes. The area under cultivation is being continually extended and new canneries are being established. A still newer industry is that of tobacco-growing. This is now emerging from its experimental stage. Experience has resulted in better cultivation, more effective fertilization, more careful handling of the green leaves when harvesting the crop, and improved methods of curing. During 1912 a cigar factory was started and is now manufacturing cigars. The output of tobacco for 1912 on the four plantations in existence was 104,000 pounds, valued at \$49,500. The area cultivated is 119 acres. New industries are constantly being started. Of these, one of the most promising is that of Bermuda onions.

The prospects for the growing of coffee, which was at one time carried on on a considerable scale in the islands, are brighter now than for some years past. The price for the last crop was 16.15 cents a pound as compared with 12.85 cents for the preceding crop. The exports of coffee in 1912 amounted to 2,127,610 pounds. Coffee is raised mostly by Chinese, Japanese, and Portuguese, although the larger estates are in the hands of Anglo-Saxons. The livestock industry is important and most of the meat is consumed in the Territory. There has been a reduction in the number of cattle in recent years, but a corresponding increase in weight and a reduction in the maturing age from about four years to about three years or less. The number of sheep has fallen off in the last few years from about 100,000 to about 80,000. This is largely due to various diseases and the overstocking of ranges. The Oriental population consumes large quantities of pork. Until two or three years ago most of this was imported from California, but the increase of prices there, due to hog cholera, gave an impetus to hog-breeding in the Territory, with the result that the local supply is sufficient for the demand.

COMMERCE. The imports and exports for the fiscal year ending June 30, 1912, aggregated \$84,143,760. This is an increase of \$14,692,597 over the amount of the preceding year. The increase was chiefly in exports, although to some extent also in imports from the continental United States. The imports from foreign countries increased slightly and the exports to foreign countries increased considerably, relatively to their totals. The imports amounted to \$28,694,332, an increase of \$1,181,742 over 1911. Those from the continental United States amounted to \$23,095,878, an increase of \$773,757, while those from foreign countries amounted to \$5,598,444, an increase of \$407,995. The exports amounted to \$55,449,438, an increase of \$13,510,885. Those to the continental United States amounted to \$55,076,165, an increase of \$13,686,224, while those to foreign countries amounted to \$373,273, a decrease of \$357,369. The exports of sugar continued to be many times larger than all others combined. In 1912 they were \$48,143,530 of raw sugar, and \$1,818,006 of

refined sugar. The imports and exports by countries for the fiscal years 1911-12 are shown in the following table:

	Imports		Exports	
	1911	1912	1911	1912
Australia and Tas..	\$294,324	\$330,263	\$7,191	\$7,820

Gr. total.	27,512,580	28,694,322	41,938,583	55,449,438

SHIPPING. During the fiscal year 1912 the tonnage entered in all the ports of the Territory amounted to 1,370,315, an increase of 26,439, and the tonnage cleared amounted to 1,359,109, an increase of 11,738. The number of American vessels entered during 1912 was 327 as compared with 313 for the preceding year. The number of all other vessels was 104 as compared with 114 for the preceding year. Although there were only about four times as many American vessels as all others, they carried about nineteen-twentieths of the freight.

On account of its isolation transportation to Hawaii from other countries has been a serious problem. Hitherto the islands have been dependent mainly upon their own demand for shipping facilities, but with the development of trans-Pacific commerce the Territory is constantly reaping in larger measure the benefits of the steamers between other countries, and the prospective opening of the Panama Canal has already resulted in orders for additional steamers, both American and foreign, in the advantage of which Hawaii will have its share. Interisland transportation is conducted almost entirely by the Interisland Steam Navigation Company. This company added during the year an additional steamer and is contemplating the construction of a 10,000-ton steamer for the bringing of coal from Australian ports to Honolulu. There are several lines of traffic between Hawaii and the mainland of Mexico. These include the American-Hawaiian Steamship Company, the Matson Navigation Company, the Oceanic Steamship Company, the Union Steamship Company, and the Associated Oil Company. A few American sailing vessels continue to carry sugar around Cape Horn. The principal railroad in the Territory is the Oahu Railway and Land Company, extending from Honolulu to the north end of the island. The only railroad of standard gauge in the Territory is the Hilo Railroad Company. There are smaller lines of railroad in some of the other islands.

PUBLIC LANDS. Sweeping changes were made in the land laws in 1910. These related chiefly to homesteading and were intended to promote genuine homesteading and prevent bogus homesteading. During the two years, 1911-12, 655 homesteads were taken up. Of these 242 were by Hawaiians, 121 by Portuguese, 76 by Americans, 7 by Russians, and 25 by Japanese. Except in a few special cases, sales of public lands for other than homestead purposes may be made

only of limited area and only for a few specified objects. During the year 17 leases were made of lands aggregating 5930 acres. Of these, the larger portion was for the growing of sugar cane.

EDUCATION. The pupils enrolled in the public schools of the Territory in June, 1912, numbered 23,752. Of these 12,965 were male and 10,787 were females. The average attendance was 20,399. The teachers numbered 591, of whom 126 were male and 465 female. There were 156 schools. Of the pupils enrolled 9298 were Japanese, 4251 Hawaiian, and 4075 part Hawaiian. There is a college of agriculture and mechanic arts in Honolulu. In 1912 this was removed to a permanent site in the suburbs of the city. Its faculty was increased to 19 members and the students to 28 in the regular and 129 in special courses.

FINANCE. The receipts for the fiscal year 1912 were \$3,904,503. The disbursements were \$4,062,816. The cash on hand at the end of the fiscal year was \$690,550. The bonded debt of the Territory at the beginning of the fiscal year was \$4,004,000, which was increased during the year by an issue of \$1,500,000 of 4 per cent. public improvement bonds and was decreased by the payment of \$50,000 of the 1903 issue of 4 per cent. fire claims bonds, leaving a total bonded indebtedness of \$5,454,000 at the close of the fiscal year. The Territory cannot incur indebtedness in excess of one per cent. of the assessed value of property in any one year or in excess of 7 per cent. in the aggregate. The bonded indebtedness at the close of the fiscal year was 3.08 per cent. of the assessed value of property.

PUBLIC HEALTH. The chief features of interest in sanitation during the year were the special rat campaign on the island of Hawaii and a special mosquito campaign on the island of Honolulu, and the steps taken to reclaim the lowlands of Honolulu. The rat campaign was undertaken on account of the plague which had become established in two districts of Honolulu. A careful study of the district led to a large increase in the number of rat catchers during the year and from 5000 to 6000 rats were caught monthly. Nearly 10,000 traps were set daily. During the year 53,841 rats and 1548 mongoose were taken, of which, during the months of February, March, and April, 79 were found to be infected with plague. In the later months no infections were found.

A campaign against tuberculosis has been carried on for several years. Special hospitals have been established in several of the islands. Radical changes have been made in recent years in the method of dealing with leprosy. Under the old system from 1904 to 1909 the number segregated annually decreased steadily from 113 to 15. Under the new system the number has increased from 15 in 1909 to 103 in 1912. This increase means not that the number of lepers has increased but that more of the lepers have been brought under control. Of the four institutions maintained in connection with this service the principal one is the leper settlement on Molokai. The United States Public Health and Marine Hospital Service has for several years been carrying on investigations in the subject of leprosy in the islands.

POLITICS AND GOVERNMENT. The governor of Hawaii in his annual report for the fiscal year 1912 makes several recommendations for needed legislation. Among these are provisions in

regard to immigration. He recommends also amendments to the land laws. He urges that the United States Reclamation act be extended to Hawaii, and the creation of a park to include the largest active volcano, Kilauea, and that appropriations should be made to continue the work upon the harbors of the islands. During the year the large contract for the dredging of the Pearl Harbor channel was completed and the harbor was entered for the first time by a large war vessel, the *California*, the flagship of the Pacific fleet. This fleet was in Hawaiian waters for a number of months during the year and during its visit, the *West Virginia*, under Rear-Admiral W. H. H. Southerland, visited Palmyra Island for the purpose of confirming the title of the United States to it as a part of the Island of Hawaii.

OFFICERS. W. F. Frear, governor; E. A. Mott-Smith, secretary; A. Lindsay, Jr., attorney-general; D. L. Conkling, treasurer; J. D. Tucker, commissioner of public lands; M. Campbell, superintendent of public works; W. T. Pope, superintendent of public instruction; J. H. Fisher, auditor; W. E. Wall, surveyor; W. Henry, high sheriff; G. R. Clark, private secretary to governor. The delegate to Congress was J. K. Kalaniana'ole.

HAWLEY, ELWIN. An American railroad official, died February 1, 1912. He was born in Chatham, N. Y., in 1850. He began his business career as a boy by selling produce in his native town. He soon moved to New York City, however, and obtained work as a newsboy in a railroad freight office. He was promoted rapidly, and having saved a considerable sum of money purchased a tugboat in partnership with a friend. In a short time he had a fleet of thirty-eight tugboats. His enterprise commended him to Collis P. Huntington, who was then in active control of the Southern Pacific Railroad, and he became one of the latter's most valued employees and trusted adviser. He remained with this railroad until it was purchased by the late E. H. Harriman. Mr. Hawley soon became known as a dealer in railroads. He bought control of the Minneapolis and St. Louis, and then of the Iowa Central. He later secured control of the Colorado and Southern, which he subsequently sold to James J. Hill. He remained chiefly a buyer and seller of railroads and railroad stocks, until the death of Mr. Harriman. He then in a measure occupied the field which was left vacant. He began the acquisition of railroads with the apparent purpose of building up a great new railway system. He acquired the Chesapeake and Ohio; the Chicago, Cincinnati, and Louisville; and the Hocking Valley. He also secured control of the Chicago and Alton and later purchased a controlling share of the Missouri, Kansas, and Texas. The last important business prior to his death was the merger of the Minneapolis and St. Louis and the Iowa Central, in accordance with the plan to associate them with a railroad south from Canada and another railroad south to the Gulf of Mexico. In spite of his active business career Mr. Hawley remained to a large extent personally unknown. He left a fortune of over \$25,000,000.

HAY. The world's hay crop in 1912 was favored in general by good growing weather for the grasses and other hay crops, but the harvest, particularly in Europe, was very seriously interfered with by continued heavy rains

1912—20

and cloudy weather. While the yield under these conditions was sufficiently large, the quality of the hay left much to be desired. In some parts of Europe the crop suffered so much from rain after the cutting that a considerable portion of it was suitable only for bedding, while in other sections the second cutting of clover and of other similar crops, after having made a most satisfactory growth, was ruined by the rains during the curing period and left upon the fields. In the United States the dry fall of 1911 and the severe winter that followed caused the failure of a large acreage of fall-sown timothy, clover, and alfalfa, but the growing season of 1912 was so favorable that the crop produced represented a yield never before equaled and of a record-breaking value. The total production amounted to 72,691,000 tons from 49,530,000 acres, as compared with the short yield of 54,916,000 tons from 48,240,000 acres in 1911. On the basis of a farm value of \$11.79 per ton on December 1, 1912, the total value reached the sum of \$856,695,000, exceeding the average value of the five preceding crops by nearly 20 per cent. and making corn the only crop of greater value for the year. The leading States and their yields were as follows: New York, 5,900,000 tons; Iowa, 4,952,000 tons; Pennsylvania, 4,537,000 tons; Missouri, 4,143,000 tons; Ohio, 4,026,000 tons, and California, 3,825,000 tons. The average yield for the entire country was 1.47 tons per acre, as against 1.14 tons in 1911. In the Western States, where much alfalfa is grown under irrigation, the average yield of hay per acre ranged from 3.40 tons in Arizona to 1.90 tons in Montana and Wyoming. Among the six leading States California ranked first in acre-yield, with an average of 1.53 tons.

HAYES, JOSEPH. An American soldier, died August 20, 1912. He was born in South Berwick, Me., in 1838, and graduated from Harvard College in 1855. He began service in the Civil War as major of the 18th Massachusetts Regiment, later becoming its colonel. In 1862 he was promoted to be brigadier-general. For several months he was a prisoner in Libby Prison. In 1865 he was promoted to be major-general for his service in the Battle of the Wilderness. At the close of the war he was appointed commissioner of supplies of the seceded States. He was by profession a mining engineer.

HAYNIE, JAMES HENRY. An American newspaper correspondent and writer, died May, 1912. He was born in Winchester, Ill., in 1841, and was educated in the grammar and high schools of that city. He served in the Civil War and was for several months a prisoner in Libby Prison. He was mustered out of service in July, 1864. After the war he served as reporter on a Chicago newspaper and from 1875 to 1877 was foreign editor of the *New York Times*. In the latter year he went to Paris as a special correspondent of several American papers. Returning in 1895, he was traveling correspondent for the *Boston Herald*. From 1898 to the time of his death he devoted his attention entirely to literary work. He was a member of many clubs and associations. He was the author of *Paris, Past and Present* (1902), and *The Captains and the Kings* (1904).

HAY-PAUNCEFOTE TREATY. See PANAMA CANAL.

HAYS, CHARLES MELVILLE. An American

railway official, died at sea April 15, 1912. He was born in Rock Island, Ill., in 1856, and was educated in the public schools of St. Joseph, Mo., and Philadelphia. In 1873 he entered the railway service as a clerk in the passenger department of the Atlantic and Pacific Railroad. He served in various capacities in the offices of this line until 1877, when he was appointed secretary to the general manager of the Missouri Pacific. With this road he remained until 1884, when he filled the same position with the Wabash, St. Louis, and Pacific. In 1886 he was appointed assistant general manager of this road. Within a few years he became general manager of the Consolidated Wabash System. He left this line in 1895 to become general manager of the Grand Trunk Railway at Montreal. During his service at that post he reorganized the Central Vermont Railway Company, a subsidiary line of the Grand Trunk, completed the Victoria Jubilee Bridge across the St. Lawrence at Montreal, and replaced the old suspension bridge at Niagara Falls with a single span steel arch. Under his management the Grand Trunk Railway was double-tracked for 878 miles. On the death of Collis P. Huntington he became, in 1901, president of the Southern Pacific Railway, but in the same year resigned and returned to the Grand Trunk as its president and general manager. In 1902 he conceived the project of building the Grand Trunk Pacific Railway, extending from Moncton, N. B., to Prince Rupert, B. C., a distance of 3600 miles. In 1910 he was elected president and director of the Grand Trunk Railway and of all the subsidiary lines with a total mileage of about 14,000. In addition he was an officer and director in many industrial enterprises in the United States and Canada. Mr. Hays was one of the victims of the steamship *Titanic* disaster.

HEILNER, LEWIS CASS. A rear-admiral, retired, of the United States navy, died January 25, 1912. He was born in Pennsylvania in 1849 and entered the Naval Academy from that State in 1866. From 1873 to 1891 he held various grades from master to commander. In 1899 he was appointed supervisor of naval auxiliaries at the Brooklyn Navy Yard and continued in this position until his retirement in 1911. Five days prior to his retirement he was appointed rear-admiral. During the Spanish-American War he was commander of the battleship *Texas*. He served at various times in the Asiatic fleet and at the Portsmouth and Pensacola navy yards.

HEILPRIN, LOUIS. An American historical scholar and encyclopædist, died February 12, 1912. He was born in Ujhely, Hungary, in 1851. His father, Michael Heilprin, who had been an important figure in the Hungarian revolutionary government under Kossuth, came to America when his son was five years old. Michael Heilprin was one of the editors of the *American Encyclopædia* in its first edition, and in the revision of this work the son, though still a youth, assisted him not only in the general work of revision but wrote several new

articles. He later revised the *Century Encyclopædia of Names* and coöperated in the editing of the *New International Encyclopædia*. His brother, the late Angelo Heilprin, prepared the last edition of *Lippincott's Gazetteer*. Mr. Heilprin was known as a man of unusual accuracy and range of knowledge. He was especially interested in matters of engineering and transportation, although his mathematical education did not go further than the elements of algebra, geometry, and trigonometry. He made occasional contributions to the *Evening Post* and the *Nation*, and was the author of *Historical Reference Book* (1884; 6th ed., 1899).

HELIOPOLIS. See ARCHAEOLOGY.

HELIO THERAPY. The treatment of disease by exposure to direct sunlight received considerable attention during 1912. Tuberculosis of the joints and bones is particularly amenable to this form of therapy, and the result obtained in Rollier's sanatorium at Leysin, Switzerland, attracted the attention of the medical world. The sanatorium is situated at an altitude of 4000 feet above sea level. Rollier puts all new patients in bed for a few days, to insure acclimatization. After two or three days the bed is wheeled out on the gallery and the sunlight exposures begun, the disease focus being exposed three times for five minutes each the first day, ten minutes the second, until the patient is getting sunlight exposure for an hour and a half daily. At the same time the body is gradually exposed to the sunlight, at first the feet, then the legs, until the patients are able to remain all day in the open air and take the sun baths for hours at a time. During the intervals the wounds are covered with an aseptic dressing. Each patient has a gallery to himself, where he can lie exposed to the light during the day, and at night also if he wishes. Colds are unknown. Children are allowed to be up and around in winter with snowshoes and bathing trunks for their only apparel.

Collet treated patients suffering from laryngeal tuberculosis by heliotherapy, with most encouraging results. The patient, wearing a broad black hat and black spectacles, sits facing the sun, and by means of a laryngoscopic mirror placed in the throat and a hand glass in front of him directs the rays of sunlight into the larynx. This procedure is repeated at intervals during the day until a total exposure of an hour or more is attained.

Kime, of the Boulder Sanatorium, at Fort Dodge, Ia., furnished some interesting observations covering the effect upon the skin of the chemical rays obtained by filtering sunlight through various media. Direct sunlight produces *erythema solare* (sunburn), marked by extreme redness, swelling and great tenderness, with subsequent peeling of the skin. There is some tendency to the formation of blisters. Sunlight concentrated by large reflecting mirrors and passed through blue glass, thus securing the maximum effect of the chemical rays, shows a great tendency to blister, but there is little redness and swelling and practically no pain. Focusing direct sunlight through a convex lens of plain glass produces destruction of the skin and, if used with great intensity, gases form beneath the outer layers of the skin and small explosions occur. This method of using sunlight is very efficacious in the removal of warts, superficial moles, and small non-malignant growths. If the light be reflected by a

concave mirror and focused, the formation of gases is not noted. Blistering is readily produced. If, after the light is focussed in either of the two ways last mentioned, it is passed through blue glass before falling on the skin, blistering is produced without destruction of the deeper layers of the skin. When a wavy, opalescent glass is employed and the sunlight is reflected with a large condensing mirror, ten feet in diameter, and passed through this opalescent glass, neither blistering nor destruction of the skin takes place, but blanching of the tissues occurs. The light used in this manner is very effective in lupus and in vascular naevi, even of very large extent. Just what the properties of the light may be that effect these various results has not been determined. It would appear, however, that some of the rays are absorbed by the reflecting mirror and others by the variously colored glasses. The wavy glass transmits the light in an irregular manner and produces results widely different and more effective, in the class of cases mentioned, than the glass with even surface.

HEREDITY. See **BIOLOGY.**

HERTEL, ALBERT. A German painter, died February 20, 1912. He was born at Berlin in 1843. He studied landscape painting in Rome from 1863 to 1867 under Fritz Greber. From 1875 to 1877 he was director of atelier at the Berlin Academy and he later had charge of a studio of instruction. Among his best-known paintings are "The Coast of Holland With Native Fishing Boats"; "A Summer Evening in Ariccia"; "Capri," and "Summer Evening From the Brandenburg Gate." He was a member of the Royal Academy of Berlin.

HESSE. See **GERMANY.**

HEWLETT, MAURICE. See **LITERATURE, ENGLISH AND AMERICAN.**

HEYBURN, WELDON BRINTON. United States senator from Idaho, died October 17, 1912. He was born in Delaware County, Pa., in 1852, and received an academic education. He studied law and was admitted to the bar in 1876. In a short time he removed to Shoshone County, Idaho, where he continued in the practice of law in the intervals of his senatorial duties until the time of his death. He first became prominent in politics in 1896, when he refused to follow the free silver Republicans of Idaho in their adherence to W. J. Bryan. Two years later he was a candidate for Congress and was defeated by a fusion of Democrats, Populists, and Silver Republicans. When the free silver craze subsided in Idaho he was elected to the Senate in 1903 as a Protectionist and Gold Republican. He was re-elected in 1909 for the term ending 1915. Senator Heyburn was one of the most aggressive members of the Senate. He was a conservative of the old type and bitterly opposed all innovations in the government which have been advocated in recent years. He also warmly fought any effort to show favor to Confederate veterans of the Civil War, and any measure before the Senate intended to show favor to them was certain to be assailed by him in the plainest terms. He fought the proposal to permit a statue of General Robert E. Lee to be placed in the Capitol. His death was attributed largely to the strenuous part

which he took in the closing days of the Sixty-second Congress. He had for months been in ill health, but insisted on taking part in the debates of the last days of the session. In particular he opposed the resolution of Senator Penrose providing for a sweeping inquiry into the campaign contributions, and for a time prevented the passage of this resolution. He was one of the most virile and able speakers in the Senate. He was the only senator who was chairman of two important committees. These were the committee on manufactures and the joint committee on the revision of the laws of the United States.

HIDES. See **LEATHER.**

HIGGINS, ANTHONY. Former United States senator from Delaware, died June 26, 1912. He was born at Red Lion Hundred, Del., in 1840, and graduated from Yale College in 1861. He studied law at the Harvard Law School and in 1864 was admitted to the bar, practicing in Wilmington, Del. He took an active interest in politics and in his early youth was an ardent Abolitionist. On the organization of the Republican party he became a member and supported Lincoln in his second campaign for election. He was successively appointed deputy attorney-general and United States district attorney. After the close of the war he won notice by the conduct of a case in which a negro had been convicted of a crime and sentenced to death. The Sixteenth Amendment had been added to the Constitution and Higgins raised a point that the negro had not been tried by a jury of his countrymen, inasmuch as no negroes had been included in the jury panel or the jury list. The United States Supreme Court supported his contention and the man was given a new trial, in which he was acquitted. Mr. Higgins was elected to Congress in 1863 and was largely instrumental in having the Fifteenth Amendment adopted. In 1889 he became United States senator after the Republican legislature had cast forty ballots for their man. When J. Edward Addicks gained control of the Republican legislature Senator Higgins retired to private life. He continued in bitter opposition to the rule of Addicks, and when President Roosevelt appointed an Addicks man to office Senator Higgins criticised the President at some length.

HIGH SCHOOLS. See **EDUCATION.**

HILL, FRANK DAVIS. An American public official, died May, 1912. He was born in Minnesota in 1862 and was educated at the University of Minnesota. He studied law and was admitted to the bar in 1884. Entering the diplomatic service, he was appointed consul at Asunción, Paraguay, in 1887, serving until 1890. He was afterwards representative of the United States in consular capacity at Montevideo, Uruguay; La Guayra, Venezuela; Santos, Brazil; and Amsterdam, Netherlands. He was appointed consul-general at St. Petersburg in 1907. After serving here for one year he was appointed to the same office at Barcelona, Spain, and in 1910 he was appointed consul-general at Frankfurt-on-Main, Germany, and held this office until the time of his death. He was a member of several learned societies.

HILL, JOHN FREMONT. An American public official and capitalist, died March 16, 1912. He was born in Eliot, Me., in 1855 and received

an academic education. He studied medicine and took a degree from Long Island College in Brooklyn. After practicing medicine for a year in Boothbay Harbor, Me., he went into business. He settled in Augusta, Me., and after reading law for a short time, became a member of the law firm of Vickery & Hill, which was later a publishing house. He took an active part in the promotion of many electric railways in Maine and in Illinois. He was best known, however, as a politician. In 1880 he was elected to the Maine legislature and later served as State senator. In 1900 he was elected governor of the State and was reelected in 1902. In 1908 he was made a member of the National Republican Committee. He was acting chairman of this committee from the time of the resignation of F. H. Hitchcock in 1908 until December, 1911, when he was elected chairman. He was one of the best known politicians in the United States.

HILL, OCTAVIA. An English philanthropist, died August 13, 1912. She was born about 1838. Early in life she showed a strong interest in sanitary science, and joined a band of workers who labored among the poor of London under the leadership of Frederick D. Maurice. She became more than ever convinced of the necessity of the employment of sanitary science among the poor, but found it impossible to put these principles into effect under the system of tenancy which prevailed. She therefore conceived the idea of herself obtaining possession of house property in the slums, of collecting her own rents and of exercising all the influence she was able in securing the transformation alike of dwellings and of tenants. She laid her proposal before John Ruskin, who advanced about \$15,000 for carrying out the experiment. The experiment proved to be successful both from a financial and philanthropic standpoint. As time went on many more blocks of dwellings came under her management in different parts of London and in 1887 the Women's University Settlement was formed, and its members cooperated with Miss Hill in the erection of many courts or streets of cottages. Recognizing the comparatively limited scope of her efforts she gave active support to the Artisans' Dwellings Act of 1874, and in 1884 was one of the witnesses examined by the special commission which inquired into the question of housing for the poor. To her efforts may be attributed much of the improvement that has been effected in the life of the poor in London. Among her published writings are: *Homes of the London Poor*; *Our Common Land*, and various articles in magazines.

HILLES, C. D. See PRESIDENTIAL CAMPAIGN.

HISTORICAL ASSOCIATION, AMERICAN. The annual meeting of this association was held in Boston, December 27-31. Additional interest was given to this meeting from the fact that Theodore Roosevelt was president, and delivered a notable address on "History as Literature." The programme of papers and conferences presented an unusual array of distinguished names. Instead of the usual programme of formal papers several of the section meetings dealt with the present condition of historical study in their respective fields. In the field of American history, Professor William E. Dodd, of the University of Chicago, and Professor Ulrich B. Phillips, of the University of Michigan, emphasized the need of a more

thorough study of slavery on its economic side. Professor C. H. Van Tyne read an informing paper on "Religious Forces in the American Revolution." Professor Henry P. Biggar, of London, read a paper of much interest on "The New Columbus." This paper traversed the recent hostile criticisms of Vignaud and upheld the older view that the discovery of America was accidental. The membership of the association is about 2800. The *History Teachers' Magazine*, taken over by the association a year ago, has been so far successful that it promises to be self-supporting. The Justin Winsor prize offered by the association was awarded to Dr. A. C. Cole for an essay on "The Whig Party in the South." A report of the committee on the preparation of teachers of history in schools, headed by Professor Dana C. Munro, of the University of Wisconsin, appears in print early in 1913. The next meeting of the association will be held at Columbia and Charleston, S. C., in December, 1913. Professor William A. Dunning, of Columbia University, was chosen president.

HITTITES. See ARCHAEOLOGY.

HOBBS, PERRY L. An American chemist and educator, died April 6, 1912. He was born in 1861 and graduated from the Case School of Applied Science in 1886. He afterwards studied at the University of Berlin, receiving the degree of Ph. D. In 1889 he became professor of chemistry at the Western Reserve University. He was one of the first chemists in the United States to specialize as a chemical engineer. He became widely known for experiments in the manufactures of concrete and was a prominent contributor to scientific periodicals.

HOCKEY. The Crescent A. C. again won the championship of the American Amateur Hockey League by scoring a victory over the Wanderers' Hockey Club in a play-off game. The standing of the clubs follows: Crescent A. C. won 7 lost 2; Wanderers H. C., won 6 lost 3; New York A. C., won 4 lost 4; St. Nicholas Skating Club won 4 lost 4; Hockey Club of New York won 0 lost 8.

The world's professional championship was won by the Quebec team in a series of games played at Boston and New York. The sevens taking part were all from Canada, and included, besides Quebec, the Wanderers, Canadians, and Ottawa. The totals in the final matches were: Quebec 12, Wanderers 9.

The championship of the Intercollegiate League was won by Princeton, which went through the season without being defeated. Columbia was second with 3 victories and 1 defeat. Yale won 1 and lost 3, while Dartmouth and Cornell, winner in 1911, failed to capture a game. Harvard withdrew from the league before the season opened.

Cleveland had the distinction of turning out the best amateur seven of the year, the team of the Athletic Club of the Ohio city playing a series of thirty-three games, winning twenty-five, losing seven, and tying one. The Boston A. A. also had an excellent record.

HOFFMAN, HERMAN S. A Bishop of the Reformed Episcopal Church, died November 23, 1912. He was born in Salem, N. C., in 1841 and was educated in private schools in that State and at the Moravian Theological Seminary at Bethlehem, Pa. He was ordained

to the Moravian Ministry in 1864. He founded five churches of that denomination in Philadelphia. In 1881 he united with the Reformed Episcopal Church and served as pastor in several parishes of that denomination in Philadelphia. In 1885 he founded Christ Memorial Church, and built the edifice of the Church of Our Redeemer in Philadelphia in 1893. In 1903 he was consecrated bishop of the Reformed Episcopal Church. He had in special charge the First Synod of the Dominion of Canada. In 1905 he was appointed assistant bishop in charge of New York and Philadelphia. He organized the Publication Society of the Reformed Episcopal Church and compiled a *Hymnal and Children's Hymns*, which have been adopted as standards in that denomination. Bishop Hoffman was a man of wealth and never accepted a salary for his religious services. He made several gifts of land on which to construct churches in Brooklyn and in the Bronx, New York City. He published *Sermons* (1886); *Life Beyond the Grave* (1898-1903), and many pamphlets on religious subjects.

HOGG, HOPE W. An English scholar and educator, died February, 1912. He was born in 1863 in Cairo where his father was principal of the American College. He received his education at Edinburgh University. From 1884 to 1894 he was principal of the American College in Egypt. In the latter year he went to Oxford as a contributor of articles to the *Encyclopædia Biblica*. He entered New College and took a degree for research in Oriental history and philology. He was a member of the editorial staff of the *Encyclopædia* from 1895 until the work was completed in 1903. From 1900 to 1903 he was also lecturer in Hebrew and Arabic in Owens College, Victoria University, Manchester. In 1896 he was examiner in the Honor School of Oriental Studies in the University of Oxford. In addition to the articles contributed to the *Encyclopædia Biblica* he made several translations, including the *Diatessaron of Tatian*. He contributed many articles on Semitic subjects to classical magazines.

HOG RANCHES. See GARBAGE AND REFUSE DISPOSAL.

HOLCOMBE, CHESTER. An American author and diplomat, died April 25, 1912. He was born in Winfield, N. Y., in 1844, graduating from Union College in 1861. He went to China when still a young man and became acquainted with Chinese dialects. From 1871 to 1885 he acted as interpreter and secretary of the United States Legation at Peking. In 1875-6, 1878-9 and 1881-2 he was acting minister. In 1880 he was a member of the commission for negotiating a new treaty with China and assisted in negotiating a treaty with Korea in 1882. In 1896 at the request of the Chinese authorities, he prepared in detail in Chinese and English, documents for the government loan of \$100,000,000. He also developed in both languages detailed plans for construction of about 3000 miles of double track railway involving a cost of about \$240,000,000. He outlined a scheme for securing the necessary funds for the establishment of schools for instructing the Chinese in railway construction and management. In 1902 he was lecturer at the Lowell Institute in Boston, Mass. He was the author of *Mental Arithmetic* (1873); *Life of Christ* (1875), and *Translation of the Declaration of Independence*, all in Chinese. He

wrote in English *The Practical Effect of Confucianism upon the Chinese Nation* (1882); *Travels in Western China* (1875); *Catalogue and Handbook of Antique Chinese Porcelains* (1890); *The Real Chinaman* (1895); *The Real Chinese Question* (1899). He contributed articles on Chinese subjects to many magazines and newspapers.

HOLMES, GEORGE. An Anglican clergyman, created in 1909 bishop of Athabasca. Died February 3, 1912. He was born in 1860 and was educated in St. John's College, Winnipeg. He was ordained to the ministry in 1887. From 1886 to 1905 he was engaged in missionary work in the Northwest Territory. From 1901 to 1905 he was archdeacon of Athabasca and from 1905 to 1909 was bishop of Moosonee. He was created bishop of Athabasca in 1909.

HOLMES, RICHARD SILL. An American Presbyterian clergyman and author, died September 6, 1912. He was born in Brooklyn, N. Y., in 1842 and graduated from Middleburg College in 1862. He studied theology at the Auburn Theological Seminary, graduating in 1868. From 1866 to 1870 he was engaged in business in Auburn, N. Y. From 1870 to 1878 he was engaged in teaching and was again in business from 1878 to 1884. In the latter year he became registrar of the Chautauqua education work. He was ordained to the Presbyterian ministry in 1887 and in the same year became pastor in Warren, Pa. After remaining here several years he occupied the pulpit of the Shadyside Church in Pittsburgh. Here he remained until 1904 when he became president of the Holmes Press in Philadelphia. He was editor of *The Westminster* from 1904 to 1910, when it was consolidated with *The Interior* in Chicago under the name of *The Continent*. Of this journal Dr. Holmes was corresponding editor. In 1880 he acted as professor of languages in the summer school at Chautauqua. He was author of *The Maid of Honor* (1907); *The Victor*, and *The Outcome*.

HONDA, YO-IOHI. A Japanese educator and bishop of the Methodist Church, died March 26, 1912. He was born at Hirosaki in 1849 and was converted to Christianity at the age of 24. He entered politics, but left on the defeat of his party in 1883. The rest of his life was devoted to religious work in Japan. He was ordained deacon in 1878 and was the first ordained Japanese minister of the Methodist Church. He visited Europe and the United States a number of times to prosecute his studies and to attend international meetings. He studied at the Drew Theological Seminary and was admitted to the Methodist ministry. In 1907 he was elected bishop. He was president of the Tokyo Aoyama Gaquin, a Christian college.

HONDURAS. A Central American republic. Capital, Tegucigalpa.

AREA, POPULATION, ETC. Estimated area, 114,670 square kilometers (44,274 square miles). A census taken December 31, 1910, was not quite complete; the inhabitants of certain sections, as in La Mosquitia, were not enumerated. The census showed a population of 553,446 (270,722 male, 282,724 female), as compared with 500,135 in 1905, 398,877 in 1895, 307,289 in 1881 and 350,000 in 1850. The bulk of the popula-

tion is Indian. The larger municipalities were returned as follows: Tegucigalpa, 22,137; Santa Rosa, 10,574; Juticalpa, 10,529; Danlí, 8477; Nacaome, 8152; Choluteca, 8065; San Pedro Sula, 7820; Pespire, 7132; Cedros, 6825; Comayagüela, 6812; Ocotepeque, 6225. Movement of the population in 1909 and 1910; Marriages, 2058 and 2241; births, 19,851 and 20,994; deaths, 9219 and 10,295. There are over 850 primary schools, with about 30,000 pupils.

PRODUCTION AND COMMERCE. The leading crops are bananas and corn; sugar cane and tobacco are raised, and cabinet woods (especially mahogany), and rubber are exploited. Grazing is important, and cattle doubtless number over 500,000. Honduras is exceptionally rich in minerals, but they are not extensively worked except at the famous Rosario gold (and silver) mine (not far from Tegucigalpa).

Recent official statistics of commerce are not available. The following import and export values have been reported: 1908, 7,075,085 and 4,585,157 pesos (silver); 1909, 6,841,115 and 5,275,094; 1910, 7,548,541 and 6,429,700. Cotton goods and foodstuffs are the principal imports, while bananas, gold and silver, rubber, hides, coconuts, and cattle are the chief exports. The foreign trade is largely with the United States.

COMMUNICATIONS. There are about 100 kilometers (62 miles) of railway; of this, 56 miles extend from Puerto Cortés to San Pedro Sula and La Pimienta, and a continuation is projected to La Brea on the Pacific coast. In addition there are about 60 miles of light railway in the banana districts. Steamers ply the Ulua River from its mouth to Progreso. Telegraphs at end of 1910, 226 offices, with 3220 miles of line; post offices, 264.

FINANCE. The monetary unit is the silver peso, whose weight is 30.723379 oz. of fine silver, the value fluctuating with the price of the metal. For fiscal years ended July 31, revenue and expenditure are reported as follows: 1908, 3,899,287 and 4,205,995; 1909, each 3,503,215; 1910, 4,149,078 and 3,992,623. The budget for the fiscal year 1911 balanced at 4,714,065 pesos. Estimated receipts included customs 1,800,000 pesos and proceeds of monopolies 1,750,000. Preliminary estimates for 1913, revenue 13,140,415 and expenditure 13,005,101. The internal debt on August 1, 1910, was 4,053,370 pesos. The external debt on the same date consisted of four loans contracted from 1867 to 1870, amounting to £5,398,570; arrears of interest from 1872, £17,535,305; total, £22,933,875. On January 11, 1911, a convention providing for the conversion of the foreign debt was signed at Washington by the American secretary of state and a special Honduran envoy. The convention was not ratified by the American Senate.

GOVERNMENT. The president, the vice-president, and the unicameral congress of 42 members are elected by direct vote for four years. On November 11, 1911, Gen. Manuel Bonilla (a former president) was elected president for the term beginning February 1, 1912. Vice-president, Francisco Bográn.

HONDURAS, BRITISH. See **BRITISH HONDURAS.**

HONGKONG. An island (about 30 square miles), off the southeast coast of China, which, with a strip of territory on the mainland leased from China (376) and about four square

miles of the Kowloon Peninsula, forms a British crown colony. Civil population (1911), 456,739 (Chinese, 444,664). Capital, Victoria (219,755). The island is the centre of an enormous trade. Being a free port, no returns are available, but a record of the shipping will give some idea of the extent of the trade.

* Foreign trade.

There is little land suitable for tillage on the island, though in the leased territory the Chinese cultivate considerable tracts. Granite quarries are worked, and various manufactories are operated. Ship-building and repairing are important industries. A railway from Kowloon to the Chinese frontier joins the line from Canton. The total revenue (one-fifth derived from the opium monopoly) for 1911 is estimated at 7,086,383 dollars. Revenue 1910, 6,960,869 dollars; expenditure, 6,907,113. Public debt, £1,485,732. Governor (1912), Sir F. J. D. Lugard.

The Hongkong University was opened on March 11. There was an outbreak of the plague about the middle of May and during one week 208 cases were reported. The number of deaths down to that date was 175.

HOOKWORM DISEASE. The second report of the Rockefeller Sanitary Commission for the Eradication of Hookworm Disease outlines the preliminary surveys of the areas of infection in the United States which have been nearly completed, and includes a report on the extent of infection in fifty-four foreign countries. Infection has been demonstrated in every county of South Carolina, in nearly every county of Virginia, North Carolina, Alabama, Mississippi, and Tennessee, and in twenty-seven out of the fifty-nine parishes in Louisiana, fifty-seven of the seventy-five counties in Arkansas, and twenty-two of the 119 counties in Kentucky. It has been found to exist in eastern Texas, Florida, California, Nevada, Oklahoma, and West Virginia, and probably in Maryland. Maps of the areas indicate that hookworm infection in these States occurs in belts or zones, the heaviest showings being in eastern Virginia and the eastern part of North and South Carolina, in central Tennessee, in the southern half of Alabama and Georgia, and in the northeastern corner and southern half of Mississippi, following the sandy plain in the seaboard States. Studies of the geographical distribution of the hookworm made through the agency of the Department of State show that the disease belts the earth in a zone about 66° wide, extending from parallel 36° N. to parallel 30° S. lat. Practically all countries in this latitude are infected. In six countries, viz., Wales, Germany, The Netherlands, Belgium, France, and Spain, the disease is confined to mines. In forty-six foreign countries, aggregating a population of about 920,000,000,

the disease is general and widespread. The total population of the infected States in the United States is about 20,000,000. Together these constitute 58 per cent. of the earth's estimated population of 1,600,000,000. The degree of infection is heaviest in American Samoa, where it is found in 70 per cent. of the population; in the southern two-thirds of China, in 75 per cent. of the population; while in India from 60 to 80 per cent. of 300,000,000 population have the disease; in Ceylon, 90 per cent. in many parts; in Natal, 50 per cent. of the coolies on sugar and tea estates; in Egypt, 50 per cent. of the laboring class; in Dutch Guiana, 90 per cent. in many parts; in British Guiana, 50 per cent. of all; in Colombia, 90 per cent. of those living between sea-level and 3000 feet, which includes most of the population; and until 1904, 90 per cent. of the working population of Porto Rico were infected. The problem is thus seen to be not local, but world-wide, and, unless controlled, sanitarians believe that the disease will produce the same evil results in this country that it has in other lands, such as India, China, and Egypt, where it has undermined the physical and mental health of the population, destroying economic efficiency and preventing social development.

An important factor in the spread of hookworm disease in the United States is immigration. Every country which imports coolie laborers from India is bringing in a constant stream of heavy infection. Of 600 coolies going into Assam, only one was free from infection. The attention of the government at Durban was called in 1908 to the heavy infection among coolies on the sugar estates of Natal. The next shipload from India was examined and 93 per cent. were found infected. The situation is particularly grave in California. At Angel Island, the immigrant station of San Francisco, 1077 aliens out of 2235 examined were found to be infected. Among the Hindus 63 per cent. were found to be infected with hookworm. The number of Hindus rejected for this condition was so great as effectually to check the immigration of this class of Orientals, which was assuming embarrassing proportions.

Besides hookworm, filariasis, amœbiasis, and malarial infections are found among Orientals coming through San Francisco, and as these people settle in various agricultural communities and use the Eastern method of fertilizing the soil with human excreta, it becomes only a question of time until foci of hookworm and other infections are established at every settlement of these races in this region.

HOPS. The world's hop crop of 1912 suffered from the vicissitudes of the weather, but the production more than covered the consumption. In many European hop districts cool and wet weather interfered with crop development and harvesting, but the yield in general was satisfactory and larger than in 1911. A part of the crop was irregular in quality as a result of untoward weather conditions. In the United States the yield was large, but in certain sections the quality varied widely. The world's production for the year was estimated at 1,797,000 bales and the consumption at 1,715,000 bales of 50 kilos, or 110 pounds each. In 1911 the production for all countries was nearly a half million bales less. Official

statistics placed the hop area of Germany for 1912 at 65,875 acres. The total German crop was estimated at 407,000 bales, distributed as follows: Bavaria, in the Hallertau, Gebirgs, Markt, Aischgrund, Spalt, and Kindingerland hop districts, 225,000 bales; Württemberg, 50,000 bales; Baden, 17,000 bales, Alsace-Lorraine, 100,000 bales, and Prussia, 15,000 bales. Germany consumes yearly about 300,000 bales. The crop of Austria-Hungary was estimated at 370,000 bales, of which Hungary contributed 30,000 bales. The Austrian crop by hop districts was as follows: Saaz, 190,000 bales; Auscha and Dauba, 85,000 bales; Steiermark, 32,000 bales; Galicia, 15,000 bales; Upper Austria, 8000 bales, and Moravia, 8000 bales. The annual home demand of Austria-Hungary is about 170,000 bales. The production of France was placed at 65,000 bales, Holland and Belgium 65,000 bales, Russia 85,000 bales, Great Britain 380,000 bales, and Australia 15,000 bales. The crop in the United States was distributed as follows: Oregon, 110,000 bales; California, 105,000; Washington, 30,000, and New York, 25,000 bales. A bale of hops in the United States ranges in weight from 180 to 200 pounds. In the Pacific Coast States the yield was large, but in New York only a light yield was secured and the quality was not satisfactory, only about one-fifth of the crop grading as choice.

The imports into the United States in the fiscal year ending June 30, 1912, amounted to about 3,000,000 pounds and the exports to more than 12,000,000 pounds. The successful use of hop-picking machinery was reported from California.

HORSES. See STOCK-RAISING.

HORSES, DISEASES OF. See VETERINARY SCIENCE.

HORTICULTURAL CENSUS. See HORTICULTURE.

HORTICULTURE. The year 1912 was marked by more or less serious shortages in the fruit and truck crops of nearly every country in Europe. The wine crop of Germany and the olive crop of the whole Mediterranean region suffered most severely. The world's reserve supply of olives and olive oil is low and prices are correspondingly high. The current Spanish orange crop was severely damaged by hail. In France there was a great deficiency of every kind of fruit for exportation. The prune harvest in Servia was cut short by the Balkan War. The total North American fruit crop ranged above rather than below the normal production. The Canadian fruit crop was generally good. Climatic disturbances were severe at times in the United States, but crops from the many vigorous orchards just coming into bearing went far towards swelling the total yield.

The estimated apple crop of the United States for 1912 was 39,000,000 barrels, as compared with 36,665,000 barrels, the final figures for 1911. The severe winter reduced the California citrus crop to 40,290 cars, as compared with 46,394 cars in 1911. Florida produced a banner citrus crop of about 20,000 cars. The California fresh deciduous fruit shipments amounted to 13,325 cars and the cured fruit pack to about 239,000 tons, as compared with 12,539 cars and 197,750 tons in 1911. The raisin and prune yields were unusually heavy. The 1912 potato crop in the United States totaled over 400 mil-

lion bushels, as compared with 293 million bushels in 1911. A record onion crop of over 6 million bushels was also secured. The tomato, pea, and corn packs for 1911 were 9,850,000 cases, 4,372,000 cases, and 14,301,000 cases, respectively. The packs of tomatoes and peas were again short in 1912.

EXPORT TRADE. The value of fruits exported from the United States amounted to \$30,354,700, as compared with imports worth \$29,549,281. Approximately one million cases of canned fruits were shipped to England. Nova Scotia exported 1,534,000 barrels of apples, as compared with 1,230,000 barrels exported from the United States. Vegetables to the value of \$18,544,873 were imported, as compared with exports worth only \$6,544,118. Imports of white potatoes alone amounted to \$7,168,627, as against \$235,847 worth in 1911. Following the public hearing at Washington in September, the Department of Agriculture declared a quarantine against many fruits and vegetables from Hawaii in order to prevent the entrance of the Mediterranean fruit-fly into this country. The Hawaiian canned pineapple trade has increased from 1893 cases in 1903 to approximately one million cases in 1912. Cuba exported 1,208,450 crates of pineapples in 1912, an increase of 218,567 crates over 1911. The value of fruit exports from Porto Rico has steadily increased from \$109,101 in 1901 to \$2,390,716 in 1912. Porto Rico started to export lemons to the United States in 1912. The Australian fruit industries have shown rapid expansion. Tasmania's export trade, principally of apples and pears, has grown from 218,548 bushels in 1901 to about 800 thousand bushels in 1912. Australian canned fruits are now actively competing with American canned fruits in southern India. Australia as a whole, exported almost exclusively to Great Britain in 1911 a total of 812,772 cases of apples, 61,226 cases of pears, and 3545 cases of grapes. A trial shipment of apples from Australia to the United States was unsuccessful.

HORTICULTURAL CENSUS IN THE UNITED STATES. According to the census of 1910 there were 49,435,000 tropical fruit trees of bearing age, as compared with 26,868,000 in 1900. These trees include oranges, lemons, figs, and pineapples. Deciduous fruit trees of bearing age including apples, peaches, pears, plums, cherries, apricots, and others decreased from 369,377,000 in 1900 to 301,117,000 in 1910. Grapevines of bearing age increased from 182,330,000 in 1900 to 224,104,000 in 1910. The acreage in small fruits decreased from 310,000 in 1900 to 272,000 in 1910, and cultivated nut-bearing trees increased from 3,702,000 to 5,027,000. Of trees under bearing age there were 65,792,000 apples, 42,226,000 peaches, and 8,804,000 pears. About 60 million grapevines under bearing age were reported in 1910. Florist establishments increased from 8797 in 1899 to 10,614 in 1909 and florists' products increased in value from \$18,759,000 to \$34,872,000. The total value of nursery products reported from 5582 establishments in 1909 was \$21,051,000 as compared with \$10,124,000 in 1899. There was an increase of 591 nursery establishments.
